## FEBRUARY 23, 1993

(Sewage Treatment Needs of Rural and Small Communities)

Summary of subject matter .....	XI
---------------------------------	----

### TESTIMONY

Harnisch, Tom, legislative representative, Wisconsin Towns Association, representing the National Association of Towns and Townships .....	52
Jones, Joe Paul, P.E., president, National Society of Professional Engineers ....	52
Long, Hon. Jill, a Representative in Congress from Indiana .....	12
Paradise, Laura, policy associate, Robert A. Rapoza Associates .....	23
Rubin, A. Robert, Ph.D., associate professor, North Carolina State University, on behalf of the Water Environment Federation .....	23
Siragusano, Joseph, board member, Ohio Rural Water Association, on behalf of the National Rural Water Association .....	52
Sprehe, Paul F., chairman, PSA Consulting Engineers, Oklahoma City, OK, on behalf of the American Consulting Engineers Council .....	52

### PREPARED STATEMENT SUBMITTED BY MEMBER OF CONGRESS

Clinger, Hon. William F. Jr., of Pennsylvania .....	5
---	---

### PREPARED STATEMENTS SUBMITTED BY WITNESSES

Jones, Joe Paul .....	89
Paradise, Laura .....	100
Rubin, A. Robert .....	124
Siragusano, Joseph .....	150
Sprehe, Paul F .....	155

### SUBMISSIONS FOR THE RECORD

Boehlert, Hon. Sherwood, a Representative in Congress from New York: Responses to post-hearing questions submitted to Joe Paul Jones, president, National Society of Professional Engineers .....	65
--	----

	Page
Long, Hon. Jill, a Representative in Congress from Indiana, draft language for consideration which addresses the Clean Water Act and the needs of small communities .....	14
Paradise, Laura, policy associate, Robert A. Rapoza Associates, paper: "Through the Revolving Door"—An Analysis of Rural Wastewater Facility Financing" .....	108
Rubin, A. Robert, Ph.D., associate professor, North Carolina State University, letter supplementing testimony .....	36

## FEBRUARY 24, 1993

(Sewage Treatment Needs of Rural and Small Communities)

### TESTIMONY

Berryhill, Don, Florida Department of Environmental Regulation, director of Local Government Financial Assistance Program .....	202
Givens, J. Dale, assistant secretary, Louisiana Department of Environmental Quality .....	183
Marchetti, Paul, E., executive director, Pennsylvania Infrastructure Investment Authority, Commonwealth of Pennsylvania, and vice president, Council of Infrastructure Financing Authorities .....	202
Porter, Keith S., director, New York State Water Resources Institute, Cornell University .....	183
Ranson, John, cabinet secretary, West Virginia Department of Commerce, Labor and Environmental Resources, accompanied by Dave Callahan, director, West Virginia Division of Environmental Protection, and Mike Johnson, assistant chief of construction assistance, Office of Water Resources .....	202
Rice, Dick, board member, Southern Alleghenies Resource Conservation and Development Council .....	202
Savage, Roberta, executive director, Association of State and Interstate Water Pollution Control Administration [ASSIWPCA] .....	183
Smith, Greg, chief, Division of Environmental and Financial Assistance, Ohio Environmental Protection Agency .....	183
Stafford, William C. Jr., chairman, Lee County North Carolina Board of Commissioners, accompanied by Robert F. Joyce, Lee County Economic Development Coordinator .....	202
Synar, Hon. Mike, a Representative in Congress from Oklahoma .....	164

### PREPARED STATEMENTS SUBMITTED BY WITNESSES

Berryhill, Don .....	239
Givens, J. Dale .....	243
Marchetti, Paul E .....	246
Porter, Keith S .....	253

---------------------------	------

[Memorandum]

To: Members, Subcommittee on Water Resources and Environment.  
From: Douglas Applegate, Chairman.  
Subject: Summary of Subject Matter for hearings, February 23, 24,  
1993 on Sewage Treatment Needs of Rural and Small Commu-  
nities.

On February 23, and 24, 1993, the Subcommittee on Water Resources and Environment will commence its hearings for the 103rd Congress on issues concerning the reauthorization of the Clean Water Act by receiving testimony related to sewage treatment needs of rural and small communities. Testimony will be received from members of Congress, state interests, local interests, the regulated community, and public witnesses. It is expected that the testimony will discuss the difficulties faced by small and rural communities, the amount of their needs and methods to address them.

In the 102nd Congress, the Subcommittee held several hearings on issues concerning reauthorization of the Clean Water Act. Topics covered in those hearings included reauthorization generally, funding for wastewater treatment needs, sludge management, combined sewer overflows, non-point source pollution, stormwater, contaminated sediments, Great Lakes water quality, water quality monitoring, water quality standards, effluent guidelines, enforcement, coastal pollution, groundwater, pollution prevention, and water conservation. Those hearings have been published as Committee Print 102-31. In addition, the Subcommittee also received testimony on issues surrounding protection and restoration of wetlands resources under the Clean Water Act and other laws. These hearings have been printed as Committee Print 102-43. Many of the same topics covered in the hearings of the 102nd Congress will be the subject of hearings in the 103rd Congress. However, it is not expected that the Subcommittee will repeat all 19 days of hearings previously held.

#### BACKGROUND

The current federal water pollution control program has its origins in the Federal Water Pollution Control Act Amendments of 1972. The law was amended in 1977, 1981, and most recently in 1987 by the Water Quality Act of 1987. It provides for a major federal-state program to clean up the nation's waters. The Environmental Protection Agency has the major responsibility for carrying out the Act but parts of the program may be administered by the states if approved by EPA. The Act generally has two major areas of emphasis: regulatory provisions that impose progressively more stringent requirements on industries and cities to abate pollution and provisions that authorize federal financial assistance for municipal wastewater treatment plant construction.

The Act established a goal of eliminating the discharge of pollutants into navigable waters of the United States by 1985. As a step toward achieving this goal, the Act imposes technology based discharge control requirements on all discharges to navigable waters. Industries must meet a standard of best available treatment technology economically achievable for their discharges. For municipalities, secondary treatment (defined as an 85% reduction in conventional pollutant concentration) must be achieved. Additional limitations may also be imposed on dischargers where pollution levels in receiving waters continue to be too high to protect designated uses. EPA is responsible for defining what the required level of treatment is for municipalities and industry to meet their standards.

The law required that publicly owned treatment works (POTWs) achieve at least secondary treatment of their effluent by no later than July 1, 1988. To assist municipalities in meeting these deadlines, the law provided for grants to municipalities for the construction of wastewater treatment facilities. EPA has obligated approximately \$57 billion for this grant program since it originated in 1972. Until October 1, 1984, the federal share was 75% of the cost of construction. Since October 1, 1984, the federal share has been 55% of the cost of construction.

The 1987 amendments to the Clean Water Act phased out the grant program in favor of grants to states for the establishment of state revolving loan funds (SRFs). Those amendments authorized appropriations of \$8.4 billion to capitalize the state revolving loan funds. States must match each federal dollar with a minimum contribution of 20 cents to each state's fund. These funds are available to provide low interest loans, buy or refinance local debt, subsidize or insure local bonds, make loan guarantees, act as security or guarantee of state debt, earn interest, and pay administrative expenses of the fund. All projects receiving funding must be those which will assure maintenance of progress toward the goals of the Clean Water Act and meet the standards and enforceable requirements of the Act. After states achieve those requirements, SRF monies may be used to implement other water pollution control programs such as non-point source pollution management and the national estuary program. EPA has approved 51 states and territories for funding under the SRF program.

The Water Quality Act of 1987 authorized for the SRF program \$1.2 billion per year for fiscal years 1989 and 1990, \$2.4 billion for fiscal year 1991, \$1.8 billion for fiscal year 1992, \$1.2 billion for fiscal year 1993, and \$600 million for fiscal year 1994. (The SRF program has been receiving approximately \$2 billion per year in recent years.) The SRF program was intended to be self supporting following fiscal year 1994. It is expected that SRF funding will continue following 1994.

The EPA produces a needs estimate biennially. It currently estimates that there are \$80.4 billion in sewage treatment needs over the next 20 years which are traditionally eligible for assistance under the Clean Water Act. Total municipal needs related to wastewater treatment are estimated at over \$110 billion. These needs exist notwithstanding the billions in federal assistance which has previously been provided. Recent estimates indicate that al-

most one-fourth of the national needs estimate is in rural communities of fewer than 10,000 in population.

#### RURAL AND SMALL COMMUNITIES

Congress has long recognized the differing needs of rural and small communities in meeting their infrastructure and environmental requirements. The Clean Water Act, in 1977, was amended to provide for a set-aside of grant funds of between four and seven and one-half percent of the sums allotted to any state with a rural population of 25% or more. The funds are to be available for alternatives to conventional sewage treatment works for municipalities having a population of 3,500 or less. By encouraging alternative technologies with special funding, it was hoped that small and rural areas would use technology more appropriate and affordable for the community. This program was designed for the expired grant program.

Other federal agencies such as the Farmers Home Administration also provide assistance to small and rural communities. Through the end of fiscal year 1991, the Department of Agriculture had made loans totalling \$3.7 billion to over 9,000 communities and made grants totalling \$1.2 billion to over 4,600 communities for rural wastewater disposal systems. Under this program, eligibility is determined by the median income of the community, the size of the community, and the health hazards associated with drinking water or wastewater systems in the community. Additionally, some communities have been able to obtain funding through the Appalachian Regional Development Act, Community Development Block Grant program, the Economic Development Administration, or state funds.

Small and rural communities often have per capita costs for sewage treatment far in excess of those of urban areas. For example, because of the dispersion of households in rural areas, costs for collector systems may be seven to eight times greater than in urban areas. Small communities may also have the disadvantage of a lack of technical expertise within the community and a lack of resources to properly operate and maintain public sewage treatment systems.

The infrastructure needs of small and rural communities have been well documented. Of total housing units in the United States, only about 75% dispose of their sewage through public sewage systems. The remaining 25% dispose sewage through septic tanks, cesspools, chemical toilets, and the like. In 1980, it was estimated that seven percent of households located in rural communities were without complete plumbing, compared to 1.9 percent of the nation's urban households. Of the nearly 1,800 treatment facilities projected to be added to those currently in operation when all needs are met for documented facilities, over one-third will be serving communities with sewage flows of less than 1,000,000 gallons per day. (One million gallons per day represents about 10,000 people.) This represents an enormous unmet need for small community systems.

There have been varying estimates of small and rural community financing needs. The Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) has estimated that small communities, which they define as 5,000 or less in population, will require in excess of \$10 billion in the next ten years.

In addition, in approximately half of the states, more than 50% of those needing construction of facilities cannot afford the debt service on a loan covering all project costs. According to ASIWPCA, the smaller the community size, the less viable existing loan programs appear to be.

A recent report by the Center for Community Change found that facility needs backlogs in rural poor counties total nearly \$600 million, or approximately one percent of the national needs estimate. This represents 11% of all counties nationwide. The data included in the report indicate that rural poor needs vary nationwide and that assistance programs may need to be targeted to address particular needs.

#### EXPECTED TESTIMONY

Witnesses are expected to testify on the needs of rural and small communities from a national and local perspective. In addition, witnesses will discuss the types of technology available to smaller, rural communities which can reduce the inherent bias of economies of scale and assist communities in the operation and maintenance of their systems.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

(Sewage Treatment Needs of Rural and Small Communities)

---

TUESDAY, FEBRUARY 23, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to notice, at 10:36 a.m., in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. Welcome to the first official meeting of the Subcommittee on Water Resources and Environment for the 103d Congress. We have a very busy agenda. Immediately we will start out on the hearings on the reauthorization of the Clean Water Act. Today and tomorrow we will receive testimony on the sewage treatment needs of small and rural communities. Later, we will hear testimony on other issues associated with reauthorization.

Since 1972, when the present clean water program had its inception, close to \$60 billion in grants have been made to the States for the construction of sewage treatment works. In earlier years, the Clean Water Act provided for direct construction grants of 75 percent and later 55 percent. But in 1987 amendments to the Act provided for the phase-out of the direct grants program and the phase-in of grants to States to capitalize State revolving loan funds from which loans and guarantees are made to communities for construction of sewage treatment works.

This latest program ends in fiscal year 1994. In spite of the substantial assistance provided, over \$100 billion in sewage treatment needs remain over the next 20 years.

Small and rural communities face special problems in meeting their sewage treatment needs. In many instances they simply cannot afford to do so because of a lack of resources. Even loans from the State revolving loan funds are of no use to them because they have an inability to pay them back.

Economies of scale are not present in small communities, often with scattered housing, so per capita costs of sewage treatment are much higher than in areas of larger, more concentrated populations. Yet the needs of these communities are very real, and serious water pollution problems do exist.

The Association of State and Interstate Water Pollution Control Administrators has estimated that small communities, which it de-

finances as those with 5,000 or less in population, will require in excess of \$10 billion in the next 10 years for sewage treatment. A recent report by the Center for Community Change found that facility needs backlogs in rural poor counties total nearly \$600 million. In order to address these needs, which are neither met by the communities themselves nor by existing programs, we should focus on the possibility of some sort of grants program targeted to small needy rural communities.

I am not down-playing the needs of large cities. God knows that they have just as big a set of problems as anybody else, and maybe more. They are certainly well documented. On the other hand, while five large cities are enjoying an appropriation of \$500 million in outright grant monies, as was administered during the later years of the Bush Administration, no such consideration has been given to small communities. Hundreds of small towns could totally eliminate their problems with that kind of money, but they are being squeezed out. We have to make room for the needs of both.

Our hearings today will focus on these small and rural communities and the ways in which their needs can be addressed. I consider this to be an extremely important meeting, as well as this series of meetings we will have. God willing and the creek doesn't rise, we will be able to come forth with a piece of legislation that everybody will be happy with.

But before we get to our first witness, I want to recognize my very distinguished colleague—and I am very happy to have him as the ranking Republican Member of this subcommittee, who does a tremendous job and who has been at the forefront of some of the most important pieces of legislation in public works since I have been a Member of Congress—Sherry Boehlert.

Mr. BOEHLERT. Thank you very much, Mr. Chairman.

There are a lot of important hearings going on in this town this morning. This is a town with important people and important topics on the agenda. But I can think of none that are more important than what we are doing here this morning.

About 75 percent of the communities across this country that are not in compliance with the Clean Water Act are poor, small, rural communities. As the Chairman observed in his opening statement, so often the attention is paid to the major urban centers—and I can understand that. Certainly, we all can understand that. That is where the concentration of people are. But that is not where the concentration of all the problems in America are.

Small rural communities are bleeding. We have to do something more than apply a band-aid or even a tourniquet. We have to come up with something that addresses their legitimate needs.

If we are determined to do something other than to stand idly by and watch the exodus of people from Small Town USA—that is where the quality of life really is—that is where most of the people who reside in these urban centers would prefer to live, if they could.

We have a task on our hands, Mr. Chairman. I think you are up to it and I want to help you. I'm looking forward to hearing our very distinguished list of witnesses and our colleague from Indiana.

Mr. Chairman, it is a pleasure to be here. We are about some important work here and I want to get on with it.

Mr. APPLGATE. Thank you very much, Mr. Boehlert.

Of course, we are very honored to have our distinguished full committee Chairman, Norman Mineta, with us today. Since I have been here, he has been one of my mentors and I listen to what he has to say. He instructs us very intelligently and hopes for the best.

We are very happy to have the Chairman of the full committee with us.

Mr. Mineta?

The CHAIR. Thank you very much, Mr. Chairman.

This is a very important subject matter and the fact that you will be chairing this subcommittee with Sherry Boehlert as the Ranking Republican frankly gives me a great deal of comfort in terms of the very important work that we are going to have before us.

This marks the beginning of a series of hearings on one of the most important environmental issues which will be coming before the 103rd Congress, and that is the reauthorization of the Clean Water Act.

The existing clean water program, which provides financial assistance to communities for the construction of sewage treatment works and regulates the discharge of pollutants into our waters, originated in 1972. In the past 20 plus years following the passage of that Act, some \$60 billion have been provided to municipalities for sewage treatment, and the discharge of pollutants from industries has declined dramatically in that time period.

Much progress has been made. However, we now face new challenges. There are less Federal dollars available. And yet, at the same time, over \$100 billion in sewage treatment needs remain over the next 20 years as communities take the steps that are necessary to comply with Federal standards. Federal spending for this purpose is now only about one-third what it was in 1980.

Much of the pollution presently entering our waters comes from nonpoint sources, from storm water discharges, and from combined sewer overflows. These issues must be addressed. New strategies such as pollution prevention and a watershed approach to achieving clean water must be considered.

Some would have us deal with the issue of wetlands protection as well. Wetlands, without a doubt, are a valuable resource. They function as nature's wastewater treatment works, and at the same time they provide the greatest diversity of biological species in the temperate zone. They are, in that respect, our closest equivalent to tropical rain forests. How to properly and reasonably protect them is, without a doubt, a complex and difficult issue.

Today's hearing focuses on another real problem: the inability of many small and rural communities to deal with their sewage problems because they lack the necessary resources. The subcommittee's hearings will lay the groundwork for our consideration of reauthorization of the Clean Water Act.

I look forward to working with all of you, and especially with the Chair of this subcommittee, Mr. Applegate, the ranking Republican Member, Mr. Boehlert, and all the Members of the Subcommittee. In addition, I look forward to working with the community at large that is vitally interested in this issue so that we are able to tackle this difficult and yet very exciting subject matter. It is so important

for the future of our children, the future of the industry and for the future of our country.

There are many issues that I know are going to have to be dealt with from financing to the substantive issues in terms of standards. Again, I look forward to working with everyone so that we might be able to come up with a bill that is doable and yet will be as far-reaching and innovative as this Public Works and Transportation Committee achieved in the 102nd Congress in developing the ISTEA legislation.

Thank you very much.

Mr. APPLGATE. I thank the very distinguished Chairman. I look forward to working with him during the course of the 103rd. I can tell you that if we have as much cooperation as we did during those ISTEA hearings in the development of one of the great transportation packages, we are going to do very well this year.

I would like to recognize at this time one of the great ranking Members of the Congress, a Ranking Member of the Public Works Committee, the gentleman from Pennsylvania, Bill Clinger.

Mr. CLINGER. Thank you very much, Mr. Chairman.

I want to applaud you and Mr. Boehlert for holding this series of hearings on the problems being faced by rural and small communities throughout this country.

There are too many communities throughout the United States that are prohibited by law from having any kind of economic growth or development because they are at capacity as far as their wastewater treatment systems are concerned. That represents a very real damper on the whole economy of this country. I think what we're addressing here is the need to break that log jam and provide some assistance to these communities so that they will be able to have the growth that presently is enjoyed by cities and more urban areas that have already addressed the wastewater problems that they have.

The current wastewater treatment enforcement regime really raises, to me, the worst kind of specter of the heavy hand of government in our affairs. On the one hand, we threaten small communities that are terribly strapped for funds, yet they must comply with these standards that have been set, but on the other hand, we give them no funds to do this with at the present time. In fact, we penalize them and threaten them with all kinds of fines and penalties if they don't comply.

This, to me, is the worst kind of example of Federal administration of a program. Since the major cities have been taken care of, the smaller communities were kind of left behind. I think that the emphasis you place on this matter at this point is exactly right. I look forward to working with you to come up with a bill that will ameliorate the real problems we are facing.

I would ask unanimous consent that my full statement be entered into the record.

Mr. APPLGATE. Without objection, your prepared statement will appear in the record.

[Mr. Clinger's prepared statement follows:]

Opening Statement of  
The Honorable William F. Clinger, Jr.  
Before the Water Resources and Environment Subcommittee  
Hearing on Small Community Wastewater Needs  
February 23, 1993

Mr. Chairman, I applaud you and Mr. Boehlert, the Ranking Republican, for holding this series of hearings on the wastewater needs of small and rural communities. I represent 15 counties in northcentral and northwestern Pennsylvania that include well over a hundred small towns, townships, and boroughs.

I have long supported federal grant assistance for wastewater treatment programs. The huge federal investment of the 70s and 80s has gone far to help restore the cleanliness and integrity of our inland waters. And I might add that these investments help insure that future generations will enjoy these same resources as we have.

In spite of the many successes, there is a tremendous unserved need, and one of the biggest disappointments, in my view, is the lack of sufficient federal investment in small and rural community wastewater treatment systems.

I am not criticizing the administration of the program during the 70s and 80s. However, I do find it offensive that federal grant support ended without addressing the needs of small communities, while holding them to the same effluent standards -- if not stricter standards -- of their big city brethren.

There are dozens of communities in my district that are prohibited by the state environmental agency from adding new tap-ins to their systems. They cannot grow, attract new business, or pursue an improved economic livelihood until they upgrade their systems at a cost well above their ability to pay. These are the very same

communities that never ranked high enough on the state's priority list to be eligible for federal assistance. And it is these communities that are held to the same performance standards.

Ironically, many small communities are fairly remote and situated at the headwaters of major watersheds. Because of the purity of the receiving waters, they will be held to a stricter standard than communities further downstream.

Finally, I know the Committee is well aware that economies of scale put a huge burden on small systems. But I can tell you from personal experience that some of the thorniest problems faced by several of my constituent communities during the 1980s was the federal government's insistence that they build and operate wastewater treatment systems at an exorbitant cost. Many studies estimate that building and operating a small wastewater treatment system today would cost each household approximately \$50 a month, depending on

certain variables. By comparison, in Fairfax County, Va., the quarterly bill for combined water and sewage services for a family of four runs about \$50.

Current wastewater enforcement frankly raises the specter of federal government at its worst; dictating compliance by threatening local communities and their elected officials with huge penalties. Local officials view this issue the same as they view any other unfunded mandate, although in this instance, the large communities have been huge recipients of federal grant assistance. We should be mindful, too, to view the wastewater program in conjunction with a whole host of other mandatory federal and state performance requirements.

Finally, it is my view that the State Revolving Fund program is simply inadequate. The amount made available to the states does not translate into reasonable costs for small communities. Congress did

not make available sufficient funds to spare small systems from overwhelming expenses associated with debt service and operations. Congress must make new resources available to make these systems more affordable. It comes down to a matter of equal treatment.

I applaud you for holding these hearings, and I look forward to working with the Subcommittee leadership to fashion a solution.

Thank you, Mr. Chairman.

Mr. APPLGATE. I will add to what has been said so far. We have heard the President give his package of spending, cuts, and taxes, but it is going to be very difficult to foresee any kind of cuts in the programs that we're trying to deal with because they are so important and they have been mandated by the EPA through the Congress. We are looking at things in a little different nature. I think we should all keep that in mind.

I am very happy to introduce Jill Long. I guess I don't really have to.

Jill, you can come on up to the microphone.

We are very pleased to have Jill here to testify. For the short period of time that she has been here, she certainly has left her imprint upon the Congress. She is a very highly respected Member, one who can address the needs that we are here to talk about. She grew up on a farm and before she came to Congress she lived on an 80-acre farm. She has been elected as Chairman of the Rural Caucus, so you know that she has rural America and small America in her heart. That is what we are here to address as far as the needs with regard to the Clean Water Act.

Mr. CLINGER. Mr. Chairman, I would like to join you in welcoming our colleague. I am really looking forward to her statement.

But before she has the opportunity to give us some good counsel, I would appreciate it if you would indulge my colleague, Mr. Inhofe of Oklahoma. He has a word he would like to give.

Mr. APPLGATE. Absolutely.

Mr. INHOFE. Thank you, Mr. Chairman.

I know we want to get things started here. If there is any one person in Congress I wouldn't want to hold up, it is Representative Long.

I think it won't come as a surprise to Representative Long and the rest of this committee that Oklahoma is making its normal contribution to this hearing by one of the witnesses who will be joining you.

I was kind of surprised to hear the figure that our Chairman mentioned, \$100 billion of wastewater treatment needs over the next 20 years. Like Chairman Mineta, I came from the ranks of Mayor of a large city. While we dealt with these needs—and they are very complicated to us—I looked around me at the smaller communities and saw that the smaller communities didn't have the money or the expertise.

I think we are very fortunate that the incoming President, the President-elect of the American Consulting Engineers Council, Paul Sprehe, will be joining us today. The fact that he has a small firm of some 18 members—his entire effort has been with the smaller communities in helping them to meet these needs. I think that is a very significant because from my observation, the major problem they had was that the smaller communities really didn't have the expertise of knowing.

As Mr. Clinger said, they get the mandates from the EPA making these demands upon them, and then all of a sudden they are thrown into this frustration of not knowing how to meet these demands. Fortunately, there are people who do have that expertise. The person who will be taking over the helm of the American Con-

sulting Engineers Council, Paul Sprehe, will be supplying that to a lot of the smaller communities.

Today, he will be supplying that to smaller communities throughout the Nation. We appreciate his good Oklahoma testimony very much.

Mr. APPLGATE. Thank you, Mr. Inhofe.

Does anybody else have anything they would like to say at this moment?

Mr. Hamburg?

Mr. HAMBURG. Mr. Chairman, I know in the interest of time—and we have many people here to testify—I would like to make a brief opening statement because the subject here this morning really directly impacts many of the small communities in my rural district.

I am very gratified to see that the focus of this first set of hearings is the sewage treatment needs of rural and small communities because, as I mentioned, in my district, which is the Oregon border down to the San Francisco Bay, there are many small communities with severe needs and major problems in this area. Although Federal programs furnish some aid to our small communities, the unmet needs are enormous. Providing additional funding support to implement the Clean Water Act must be a constant focus in our considerations today and throughout the Act's reauthorization.

Many small communities did not build needed wastewater treatment facilities under Title II construction grants when those were available. Now the SRF loans are out of reach for many of these communities. They have special needs: they often have a limited tax base, lower household incomes, and higher per capita costs. The prospect of repayment, even at reduced interest rates, is sometimes prohibitive.

We must now literally pay the price for the unaddressed needs of our small rural communities. EPA estimates that one-third of the \$110 billion projected national cost for complying with the Clean Water Act is for small rural communities. Throughout our country, there are numerous examples of small communities thwarted by the lack of funds.

In my district, the tiny newly incorporated town of American Canyon has recently formed a joint powers authority with its larger neighbor, the city of Napa, to construct and operate a new facility. There are currently no Federal funds available and the communities are about to proceed with this project at a cost of approximately \$46 million. Unless Federal aid can be obtained, however, the economic impact of this construction project could be devastating.

The connection fees and rates in this small town of American Canyon will cause a 400 percent increase in sewer costs. These are not wealthy people. Over 20 percent of the residents of American Canyon live on fixed incomes and many of them are dependent upon the nearby naval shipyard, one which is currently being considered by the Base Closure Commission and will have an impact of scores of millions of dollars of lost incomes for this community. So we have kind of a double whammy here with infrastructure needs and meanwhile a crumbling economy.

The project that is being considered by these communities is an innovative model designed to minimize energy consumption and produce reusable wastewater which will decrease reliance on other water sources. A portion of the reclaimed water will be used for a model wetlands restoration project to enhance habitat for endangered species. This visionary treatment facility will be built. However, without Federal dollars to help underwrite construction the impact may cripple the users.

In most other areas throughout my district, rural communities face isolation and cannot even consider lightening the financial burden by going into a collaboration with a neighboring community. For example, 5,000 people live in the small rural town of Willits, just north of my hometown of Ukiah. They have recently borrowed \$4.5 million to replace part of the main sewer line. This has resulted in user fees which are among the highest in all of northern California.

Seven creeks flow through this small city and storm waters regularly inundate the sewage plant and overflow the five retention ponds. This most recently occurred during the recent very serious storms in northern California where this inundation caused a flow into the river and the possible fining, which other Members have spoken to already. The community simply cannot bear the projected \$18 million cost of the additional retention pond and pipeline extensions so critically needed.

These cities are not exceptions to the rule, rather they are indicative of many small communities in my district and throughout the country with severe wastewater treatment problems. These communities often lie along waterways. Their needs must be among our highest priorities in consideration of funding under the reauthorization of the Clean Water Act.

Thank you.

Mr. APPLGATE. Thank you, Mr. Hamburg.

If there are no other statements to be made, we will recognize Ms. Long.

#### **TESTIMONY OF HON. JILL LONG, A REPRESENTATIVE IN CONGRESS FROM INDIANA**

Ms. LONG. Thank you, Mr. Chairman, Mr. Boehlert, and other Members.

I really appreciate the opportunity to testify before the subcommittee today about the clean water needs of rural America. I am pleased that you and the Members of the subcommittee have placed the reauthorization of the Clean Water Act high on your list of priorities for this year.

I am especially pleased to speak before this subcommittee because Mr. Ewing also serves on this subcommittee, and he, in addition, serves as the vice chair of the congressional Rural Caucus, and serves with distinction.

The Clean Water Act is a landmark measure that has been instrumental in improving the quality of our waters in both urban and rural areas. I wholeheartedly support the intent of the Act and the State Revolving Fund. However, despite the good, economically feasible intentions of the Act and the SRF, the available funds are,

in large measure, simply not finding their way down to the small rural communities.

These smaller rural communities are anxious to become active participants in improving their local environment. However, many are unable to carry out these and other Federal mandates because they simply do not have the tax base, the resources, the expertise, nor the financial flexibility necessary to complete the process required to effectively compete for the available funding.

This mix of inaccessible Federal funds and the overall increase in the number of Federal mandates undermines the very good intentions of local leaders while forcing prolonged noncompliance. Meanwhile, the estimated \$13 billion or more in wastewater facility needs in rural communities continue to grow.

With this in mind, I believe we must look for ways to provide small communities access to the financing and technical know-how necessary to construct needed wastewater facilities now and in the future by creating constructive and innovative approaches within the existing framework. Let us begin by working to involve local government officials in devising national clean water strategies.

In order to promote effective and cost-efficient ways to tackle our pressing clean water needs in both the short and long terms, I think we must look at bottom-to-top approaches to carry out Federal programs, while refraining from enacting future laws which apply a one-size-fits-all mandate, or mandates, on communities of varying sizes that have unique problems and solutions.

While a typical urban center may have an economic specialist to develop an aggressive program to obtain available assistance, the situation in small, rural communities is very different from that. Recognizing these differences, we should consider providing rural communities assistance and guidance with financial management, budgeting, planning, and development of funding to further enhance their ability to consider available construction options.

Meanwhile, these communities must meet compliance deadlines and they are forced to pay penalties for noncompliance. At the same time, they find themselves unable to gain access to affordable financing to take the necessary steps to comply with Federal statutes—in this case, constructing needed wastewater treatment facilities.

Mr. Chairman and Members of the subcommittee, finding solutions to our current clean water financing mechanism, as well as determining future clean water needs, while taking into account our Nation's dire budgetary condition, will undoubtedly prove to be an arduous task. However, I am confident that we can find practical solutions to these problems by working together in a close, bipartisan fashion as we set our sights on providing health, affordable, and accessible water to all Americans.

I also submit for insertion in the record a short list of items which may be applied to the Clean Water Act reauthorization and which recognize the needs of rural communities.

[Memorandum/list referred to follows:]

## M E M O R A N D U M

To: Chairman Applegate  
From: Jill L. Long  
Date: February 23, 1993

Re: Clean Water Act reauthorization

Dear Mr. Chairman:

As you may recall, during a Congressional Rural Caucus meeting several weeks ago you mentioned the importance of ensuring that rural communities are treated with greater fairness when considering reauthorizing the provisions contained in the Clean Water Act.

With this in mind, I took the liberty of drafting some language which addresses the Clean Water Act and the needs of rural communities. Below is a summary of the proposal, and attached is the draft language for you to consider including as part of the mark-up vehicle. Incidentally, while this proposal would be helpful to rural communities, it would not increase either the overall costs of the program nor the Federal deficit.

Bill Summary

Section 2.

(a) Loan Program -

In an effort to allow small, rural communities to more effectively qualify for State Revolving Fund (SRF) assistance, section (a) seeks to extend the loan term and amortization period from 20 to 40 years for qualified "economically distressed rural communities" (see Definition below).

Section (a) would also extend the period in which principle and interest payments on the loans commence from one to three years for economically distressed rural communities.

The language contained in section (a) is written so that States have the discretion of extending the above time periods for economically distressed rural communities.

Finally, section (a) requires States to use not less than 15% of the funds deposited into its SRF to make loans to economically distressed rural communities.

### Section (b) Technical Assistance

Certain proposals in the past sought to set up a grant program to provide small communities with technical assistance. In an effort to avoid setting up another separate Federal program, section (b) would amend existing language, which currently enables States to use a portion (4%) of their SRF for administrative costs. Section (b) would increase this percentage to 6% -- assuming the SRF program is extended -- allowing States to use the extra 2% to carry out a technical assistance program, as described in this section, for economically distressed rural communities.

### Section (c) Definition

Legislation introduced during the 102nd Congress sought to provide 25% of the SRF for rural communities with populations of 5,000 or less. However, this proposal seeks to provide communities with populations of 3,500 or less with the funds provided in section (a) (which also makes a lower percentage of the SRF funds necessary in order to carry out the section (a) program).

The other two parts of the Definition are similar to those proposed in legislation previously introduced.

Mr. Chairman, I hope this proposal is helpful to you as you further consider the reauthorization of the Clean Water Act.

In advance, thank you for your consideration.

Ms. LONG. Thank you again for allowing me the opportunity to testify here today. I would be glad to answer any questions.

Mr. APPLGATE. Just as a matter of asking, do you have any specific horror stories or any examples from your district on some of the problems that face these small communities?

Ms. LONG. There actually are a number of horror stories, one in a small town in my community that, in order to meet compliance, went ahead with a wastewater plan. As a result, the rates for each household quadrupled, or may have even increased to a greater degree than that.

But also I think that more than the horror stories are the problems of the inability to move forward, particularly when we have communities that are trying to be innovative. We have one county in my district that is working very hard to resolve the problem as cost-effectively and as efficiently as possible by joining resources across the county rather than each small community dealing with it individually. They keep running into bureaucratic red tape. They have limited resources and therefore don't have the large staffs of legal counsel as well as large staffs of specialists. They are simply not able to be competitive when it comes to applying for the funding.

Mr. APPLGATE. Mr. Boehlert?

Mr. BOEHLERT. I am not quite familiar with Indiana. I am a former county executive, so I know how New York works. I know the plight of the small communities.

Do most of the counties in Indiana have county planning departments?

Ms. LONG. There are county planning departments, but when it comes to wastewater treatment and compliance with the Clean Water Act, much of that is handled by individual towns and cities, some of which are very small. So there are, but in terms of having county-wide planning for water treatment, that would be the exception rather than the rule.

Mr. BOEHLERT. And in the small jurisdiction, they all turn to the county for assistance in planning. The county is limited in what it can offer. So would you be receptive to providing funding directly to counties for planning assistance, and that funding would be earmarked for rural communities of, say, 10,000 or less?

Ms. LONG. I would certainly be receptive to that. In fact, I would probably wholeheartedly embrace it. I think that would work very well.

But I also think there has to be flexibility in the language that allows counties and local communities to work to address these problems in fairly innovative ways because the problem changes dramatically not just as you go from urban to rural but as you go from one rural community to another rural community. Our rural communities deal with something very different from rural communities in Montana, for example. So I think there has to be flexibility as well.

Mr. BOEHLERT. Thank you very much. I really appreciate your testimony.

Ms. LONG. Thank you.

Mr. APPLGATE. Does anybody else have anything else?

Mr. Gilcrest?

Mr. GILCREST. Thank you.

Welcome back to Congress.

Ms. LONG. Thank you.

Mr. GILCREST. Mr. Boehlert made some recommendations which I think we would all agree with as far as the funding, planning, and things of this nature.

Would you go so far as to say that we should get back into grants as far as sewage treatment plants are concerned from the Federal Government the way we had some years ago, as opposed to basically the Revolving Loan Fund that States have now. Or is it possible—because grants have a tendency to be heavily weighted on the political structure in that whoever has the most clout gets the most grants—that there could be a way to use the dollars from the grants to the States to reduce the amount that the people in any area—whether urban or rural—would have to pay as far as the Revolving Loan Fund was concerned?

That could be flexible to meet the needs of hard-hit rural areas where there are only a few people who would have to pay back a big loan.

What do you think of something of that nature?

Ms. LONG. Well, I think grants can work very well. They certainly have their place. The nice thing about the State Revolving Fund is that it allows the dollars to go farther and to reach more communities. I think a mixture or combination would probably be most effective.

But in addition to that, I think we have to look for different ways of resolving the issue of water treatment in rural communities. For example, I think it is possible—and we want to make sure that communities are in compliance, but it may be possible to use a lower technology for treatment in rural communities than in an urban center because you have more land space. By using a lower technology, we might be able to bring the cost down per household, or per user. I think we need to look for flexibility and build flexibility into the policy. You have flexibility when you have a combination of grants and loans as well.

But we need more. In addition, we need to provide assistance to rural communities so that they are better versed on the policy and the options and better able to compete with the larger urban areas that have paid staff.

In my own community, we have a lot of volunteers who are helping to put together fund applications. That is very different from a major urban area that has a large staff of individuals who have expertise in writing grants.

Mr. GILCREST. Thank you.

Mr. APPLGATE. Thank you, Mr. Gilchrest.

Mr. Mineta?

The CHAIR. Mr. Chairman, let me just ask a couple of questions of our very fine colleague.

You have used a couple of phrases—noncompetitive and flexible. Noncompetitive in what sense? Because of paid staff or lack of paid staff in rural areas? The fact that you don't have local match as the bigger communities might have?

Ms. LONG. Both of those. Noncompetitive in the tax base as well as noncompetitive in the human resources within the local governments.

The CHAIR. Is that because the program through the State Revolving Fund—I am asking this because I don't know—is that because the delineation of the area is by county? Or should it be by watershed area?

Ms. LONG. I think it is because in rural communities you have public officials who serve in a part-time capacity. Oftentimes you will have public officials who are virtually volunteering their time to the local government. As a consequence of that, you have people who are competing when it comes to writing a loan application—they have a full-time profession or a full-time job. Then in their spare time they are working on writing applications for their local community.

That contrast greatly—

The CHAIR. Let me ask along that line, though. That is the problem that you see under the existing State Revolving Fund program?

Ms. LONG. That as well as a lesser ability to get the matching funds or to produce the matching funds.

The CHAIR. It seems to me the problem we're facing here is that where we have been rocking along at a \$2.5 billion program—we have \$600 million left in terms of authorization and yet the Administration is talking about zero in the future as far as Federal funds to the State Revolving Fund.

Would we be better off continuing the funding to the State Revolving Fund, or should we go to the old Federal grants program through EPA?

Ms. LONG. In my own judgment—and I am speaking now just for myself—the State Revolving Fund can work because it will allow the dollars to go further. But the regulations have to be more flexible so that smaller communities can utilize them.

The CHAIR. I will get to the flexible issue in a minute.

I am hoping—and this is just me sort of thinking out loud—that we would be able to increase the amount of money that goes into the State Revolving Fund \$3 billion, \$4 billion, \$5 billion from the Federal level rather than having this thing terminate at some point. I think it is terminating in a year.

So it seems to me from a local small community perspective that if we could fund the program adequately the local smaller communities would be better served through a State Revolving Fund than having to go through a grantsmanship program back here to Washington, D.C. through the EPA.

If you had your druthers—

Ms. LONG. A combination, but I believe we can make dollars go farther in a State Revolving Fund. I believe we can make that happen.

I don't want to say that I am opposed to grants because there may be some communities that have such a low per capita income that the grants would be necessary, but I believe the State Revolving Fund works. I think it can be made to work better.

The CHAIR. I feel that same way. I am hoping that maybe by adequately funding it we may be able to bring some relief to the rural community.

The other piece of it you mentioned is flexibility. I think this is something that we can deal with—or will attempt to deal with—only because of the catch 22 we get ourselves into because not all the regulations are, let's say, within the jurisdiction of just this committee. There are other areas that are in the jurisdiction of the Merchant Marine and Fisheries Committee, or maybe even possibly the legs and arms of the Energy and Commerce Committee.

So we have a problem of trying to deal with the flexibility, even though we may want to try to help as much as possible, that somewhere a lot of that may not fit because of the jurisdictional issue.

The other thing I want to deal with is—having been in local government, as have a number of our colleagues—trying to establish the relevancy between the standards that we have and health and safety. I think our technology to detect is overtaking our technology to treat. If we have machines that are able to detect one part per million and, then somehow that becomes the standard. If someone else comes up with a new machine that can detect one part per hundred million, then that becomes the standard. Then someone else comes up with a machine that will detect one part per billion, and now some are discussing machines that will detect one part per trillion.

I don't know whether one part per billion of copper in the water is really more safe as a standard that one part per hundred million. Yet somehow, because the technology of detection is advancing, it is setting the standard for us.

One of the things I want to determine in this whole series of hearings we are going to go through is the relevancy. I think those kinds of things are impacting much more adversely on rural communities because, as you say, the spread may not be there to necessitate this kind of treatment. On the other hand, there may be other problems that you're dealing with that may impact—in other words, something that may help you may adversely impact on my good friend, Mr. Hayes' committee in Louisiana.

I want to take a look at this whole issue of standards, not to open up a can of worms, but we have resources that we have to stretch out. I want to make sure that what we're doing is relevant to health and safety as well.

Ms. LONG. I really commend you for that.

The CHAIR. I think what you have contributed to our deliberation today will be very helpful. As you have said, the earlier position was that everybody had to have secondary treatment. There may be instances where secondary treatment as a minimum level may not be necessary.

The other thing is, maybe we don't have to go to these large plants where you have pipes underground conveying stuff to a large water pollution control plant. Maybe package plants can do it somehow. I don't know. This is something that is discussed. I know a number of years ago, it created a real firestorm. But it seems to me that that is something that we also should take a look at in terms of package plants.

In any event, I want to thank you, Jill, for your great statement in getting our eyes to be opened to these alternatives.

Thank you very, very much.

Ms. LONG. Thank you.

Mr. APPELGATE. I thank the Chairman.

Mr. Horn?

Mr. HORN. I agree with Chairman Mineta's comments. One word he used triggered some thoughts: the whole idea of watersheds. As a newcomer to this committee and to try to make a balance between the feasibility of, say, package plants that could meet real needs in small cities versus some type of watershed regional cooperation—my background is that I grew up at San Juan Bautista, California. This is known as the city without a government in California since they abolished the whole government because they couldn't pay any bills. There are 1,100 people or so that live there. Some of us grew up and still have ranches out in the country far away and septic tanks are common—when they work. It is very green around the septic tanks, you will find in most places.

But what I think of is, How do you reach out with this small grant program to bring in collectives of farms and little towns far from a center city? San Jose is 45 miles from us; Gilroy, 10; Hollister, 13.

I would be interested to know, What is the feasibility of some sort of regional watershed cooperation? Or do the technological costs of all the lines and the rest just price itself out of the market?

Ms. LONG. I think you look for different kinds of technology that work with larger land space and a smaller number of users. I would argue very strongly in favor of earmarking a certain portion of the SRF money or grant money to go to rural communities. But I think writing flexibility into the language is a very important component so that a rural community—I am sure the needs in your rural community are very different from the needs in my rural community. It is going to be difficult to be user friendly to the rural governments and the smaller governments unless we allow that flexibility as well as technical assistance.

Mr. HORN. Thank you.

Thank you, Mr. Chairman.

Mr. APPELGATE. Thank you, Mr. Horn.

Mr. Hayes?

Mr. HAYES. Thank you, Mr. Chairman.

I noticed in the printed copy of your testimony that you made a reference to providing rural communities assistance and guidance with financial management, budgeting, planning, development, and funding as opposed to the resources—in urban areas specialists are available. My experience has been with communities under 20,000 that not only are there no such specialists, but the budget of the entire city government would be eaten up by paying someone who is as good as the person who handles the major metropolitan area.

What agency or mechanism did you have in mind? The idea is one I totally agree with, but have you thought through a suggestion on implementation or the equivalent of ASCS or something that would be manageable?

Ms. LONG. There are probably a number of ways it could be done, but the most cost-effective way I think is to not spread it across

agencies and departments but to try to concentrate it in one agency or certainly within one department. When you start spreading it across, then you end up spending more money on administrative costs.

I would also say that working with associations or counties and associations of cities and towns and so forth, that would be a good way to get the information and to provide the technical assistance.

Mr. HAYES. The second point I would like to make is a follow-up to Chairman Mineta's comment about technology.

A concern that I have is that in a bill as large as the Clean Water Act, we have conflicting mandates and we have dueling Federal agencies. In other words, let's take your State where I have been very active in your farm community. I was recently in Indianapolis the same time you were.

If we start looking at rural Indiana communities that are in the heart of wetlands, then we have a mandate to do clean water and to do sewage and to accomplish a much higher level for human consumption than under these abilities to detect parts per anything in the water we would have known before we got better technology—good.

Now, how do we do it? We have a section 404 permit process that in an urban area, in the heart of New York, is not going to be too difficult to get past because there is very little that hasn't already been built. But in a more rural area, it goes through a lengthy proceeding where you have EPA doing one chore under Clean Water Act section 404, and EPA mandating another chore under the Clean Water Act of 1972 as we authorize it.

This, to me, is the biggest burden that we're coming into in rural areas. If we don't make decisions here on priorities and agency oversight, then we will be turning over land planning to Federal agencies without ever passing a national land use bill. That, to me, is a frightening concept and one that should be debated and the mechanism clearly stated as to where we're going and where we're intending to go, rather than to let regulations usurp what should be the legislative responsibility.

In your State and mine—the watershed concept is excellent and fine. The watershed of the Chesapeake Bay is the entire State of Pennsylvania and 90 percent of New York. How do you implement that from the standpoint of Maryland? From the standpoint of Pennsylvania? From the standpoint of New York? Do you do permits in the entire State of Pennsylvania for any activity as its consequences derive on the State of Maryland?

It is good to use words in Congress, but when we're not implementing them with sufficient legislation to point the agencies and departments in the direction we're sending them, then you can have some terrifying consequences.

Thank you.

Mr. APPLEGATE. Aren't you glad you didn't have to answer that one? [Laughter.]

Mr. Inhofe?

Mr. INHOFE. To follow-up a little bit, we have heard Mr. Hayes talk about his cities and his towns that don't really have any type of expertise and they are in a way competing. We have heard Mr.

Horn talking about his town with no government at all. You talked about the associations of counties and towns.

That is the way we do it in Oklahoma. We call them the councils of government where you take areas of the State that have those things in common and they address them.

On the other hand—and I found this out when I was Mayor of Tulsa—we find that the surrounding smaller communities within that council of government are often competing for the same dollars. So it gets down to the ability of those townships to have some professionalism.

Actually, rather than to ask you this question, I would like Mr. Paul Sprehe to think about this prior to the time that he gives his testimony. Even though Mr. Hayes says that there is no expertise available, I think perhaps the American Consulting Engineers Council is pretty widespread over where they can give that individual attention. I know that is true and that that has resolved the problem in Oklahoma.

Do you find in Indiana that sometimes within certain of those association areas there is competition for the same grants and for the same money?

Ms. LONG. I think more than sometimes that that is probably the rule rather than the exception. But I think that everything you have stated points to the need for flexibility as well as the need for earmarking some of these funds specifically for rural communities.

I can't emphasize enough the need for assistance and the need for flexibility that treats rural communities differently from large urban centers.

Mr. INHOFE. Thank you.

Thank you, Mr. Chairman.

Mr. APPLEGATE. I would just say that the problem certainly is very serious. I am hoping—and I don't know whether we will be able to do much about establishing a grant program that would zero in and target the small rural communities, particularly on a needs basis, and allow them to be able to enter into a program with the State through the State Revolving Fund so that they will have the ability to be able then to pay for that.

I agree with what the Chairman was talking about, too, that detection is exceeding the ability to be able to treat. I was just asking counsel if there is an ability to be able to finally end up getting zero. That would be some kind of a super tertiary type of plan where there isn't anything.

But that is the same problem we run into in the Clean Air Act. You're finally ultimately reaching out to try to find—and they will because there will be detections that will say there is absolutely none—then you have to find a way to achieve that. It is just going to be an impossibility. It makes it more difficult, particularly as we reach down to the rural and small communities.

Mr. TUCKER?

Mr. TUCKER. Thank you very much, Mr. Chairman.

I truly appreciate your testimony here today, Ms. Long. It has been most edifying.

I have to ask the enigmatic question. How do you define a small and rural community? Is there any kind of threshold?

Ms. LONG. I think typically we have said under 10,000. But again, I think there has to be flexibility because that varies as you go from the east to the midwest to the west. I would hope that there would be flexibility in the language involving that. What if you have a small town of 10,100, for example?

I think you need to look at both the size of the town and the size of the county that the town is located in. Then there should be flexibility.

Mr. TUCKER. Obviously, in the opening statements from the chairmen, they have talked about how bigger cities and urban areas so easily get the funding. Then you have that category between the small and the rural.

I am a former mayor, myself, from the city of Compton. We have a population of about 100,000. We most certainly have some real severe concerns toward sewage rehabilitation and secondary treatment. Once again, it is in that middle ground of being a community that is not a major urban area, but then again considered to be one of the small municipalities in the State of California. Most certainly with the wastewater treatment and the issues we're addressing today would be a great way to generate job creation.

I was concerned as to how that would fit in in terms of this secondary market that we're talking about.

Your answer would be flexibility?

Ms. LONG. Yes.

Mr. TUCKER. Thank you.

Thank you, Mr. Chairman.

Mr. APPELGATE. Thank you, Mr. Tucker.

If there are no other questions of Ms. Long, we are again very grateful for you appearing before the committee. We look forward to working with you.

Ms. LONG. Thank you. I really appreciate the opportunity to be here.

Thank you.

Mr. APPELGATE. Thank you. I am going to mention to those now who will be coming up that we went a little bit longer with Ms. Long on the questions. We have but about 2 hours and 20 minutes, at which time the full committee will be meeting. So we are going to be a little bit under the gun. Perhaps we will be able to expedite a little bit. If your statements are short, fine; if they are long, please summarize them.

I would say to the committee Members, too, that we will be under the 5-minute rule and try to keep our questions and statements very concise, direct, and to the point.

Our first panel would be Rapoza Associates, Laura Paradise, Policy Associate and Water Environment Federation with A. Robert Rubin, Associate Professor, North Carolina State University.

Welcome to the committee. Being the chivalrous person that I am, I will allow Ms. Paradise the opportunity to speak first.

**TESTIMONY OF LAURA PARADISE, POLICY ASSOCIATE, RAPOZA ASSOCIATES; AND A. ROBERT RUBIN, ASSOCIATE PROFESSOR, NORTH CAROLINA STATE UNIVERSITY WATER ENVIRONMENT FEDERATION**

Ms. PARADISE. Thank you, Mr. Chairman.

My name is Laura Paradise and I work as a policy associate with Rapoza Associates, a consulting firm that conducts policy research and provides legislative support on rural and low-income community development issues. For the past 5 years we have collaborated with the Center for Community Change and the Rural Community Assistance Programs on research activities that address rural poverty needs. We have focused primarily on rural drinking water and rural wastewater concerns emphasizing changes in Clean Water Act funding and their impact on rural wastewater projects.

These policy research activities have been supported by the Aspen Institute and the Ford Foundation.

It is particularly a pleasure to appear before this committee to discuss the wastewater facility needs of rural communities and small towns. For too long there has been inattention to rural wastewater needs. These needs have not been a Clean Water Act funding priority. As a result, small and rural communities received a relatively small share of EPA construction grants funding. It appears that these communities will not receive an increasing share of funds under the new State Revolving Fund programs.

I am going to talk a bit about the wastewater problems of rural areas and then provide some recommendations to the committee regarding measures that may be taken to better address rural wastewater needs.

Before I begin, I would like to request that the Executive Summary from "Through the Revolving Door: An Analysis of Rural Wastewater Facility Financing" be entered into the record.

Mr. APPLGATE. Without objection, it will appear in the record.

Ms. PARADISE. Thank you.

This is a report we worked on that provides a comprehensive analysis of the State Revolving Fund loan programs and the actions being taken to target rural needs and the match between rural wastewater needs and available funding options.

The data from this book is from the 1988 needs survey, so bear with me if my numbers a little different than some of the numbers you have discussed.

Basically, today almost three-fourths of the United States population is served by municipal sewage collection and treatment facilities. Most of the population is served by a very small number of facilities. However, most of the facilities in the country—90 percent—by definition are small, serving populations of fewer than 10,000 people.

In the EPA needs survey, the compliance projects and cost estimates necessary to meet Clean Water Act standards are documented. The 1988 survey showed a backlog of \$63 billion in wastewater needs nationwide. Rural wastewater facility needs accounted for one-fourth of that national estimate, \$13.7 billion to address facility needs of communities of less than 10,000 people.

Nearly three-fourths of all identified projects in the survey were required to address rural wastewater needs. Clearly, given the concentration in terms of number of projects in rural areas, these communities have not kept pace with changing environmental standards. As I describe some of the characteristics of rural needs, it becomes clear that rural areas have had a low priority traditionally in the Federal funding program.

Overall, the data shows that even where rural areas are served by municipal sewage collection and treatment facilities, these facilities are not able to provide adequate treatment as mandated by the Clean Water Act. Moreover, the estimates show that rural areas continue to rely on substandard individual facilities—including outhouses—that must be replaced by municipal collection and treatment facilities.

Rural facilities needs show the greatest national need for secondary treatment facilities where none currently exist. One in six facilities in rural areas discharges either raw sewage or sewage treated at a level below that of secondary treatment. More than 16 percent, twice the national rate, of facilities in rural poor counties are not providing secondary treatment.

Even those rural treatment facilities that do provide secondary treatment exhibit the highest incidence of noncompliance with their discharge permit standards. One-fourth of all rural treatment facilities are violating their discharge permits. Facilities serving poor residents have the worst record with nearly one in three in violation of their discharge permits.

Perhaps most significant, numerous rural households continue to be served by substandard individual facilities, including outhouses, homes that lack complete plumbing, cesspools, and straight pipes discharging untreated waste into neighboring streams. EPA data shows that rural new construction projects account for 90 percent of all new building activity documented in the EPA needs survey. Nearly one-third of all projects that were identified in rural areas are for new sewage collection and treatment facilities.

As an aside, States submit separate estimates to the EPA needs survey that show projects that are necessary but do not meet documentation criteria. In these separate estimates, projects to replace inadequate individual facilities in rural areas predominate. There is no actual dollar cost provided to go along with this number, but it is important to note that many rural areas—as has been discussed—do not have technical staff. Therefore, they do not have the sophistication to provide the documentation to meet EPA requirements.

However, States have identified that there is a major backlog in terms of addressing on-site rural sewage treatment problems that isn't even documented in the needs survey.

Although EPA data focuses on regulation-related needs, there is very little information about a community's ability to achieve or maintain compliance. Yet because rural systems are more likely to serve poor residents than other systems, it is also likely that these systems are constrained in their ability to address or maintain compliance.

We have spoken to State environmental regulators and State revolving loan staff throughout the country to try to gain some more information about the characteristics of rural wastewater facility needs. In fact, 32 States confirm that compliance problems are prevalent in communities where residents can least afford to finance improvements. Limited revenue-generating capability, poor financial management practices, and little or no capital planning contribute to ongoing facility problems in rural areas.

I am going to go through a few examples of the types of compliance problems we found.

Noncompliance is often the result of poor operation and management. User charges are too low. Facilities do not generate sufficient revenues to cover maintenance costs, equipment repair, or replacement. Many do not employ trained operators. Noncompliance facilities typically serve a small, often rural, low-income customer base with limited debt repayment ability.

Households served by small and rural facilities are paying a larger share of their income for wastewater services than do residents in other areas. Further, these households are predicted to experience the greatest increases in annual costs in order to comply with emerging standards and because they have to borrow to finance these improvements and cannot obtain the grants. Service shut-offs are already becoming a reality for some low-income households in both urban and rural areas because of rising utility costs.

The recent transition to State Revolving Fund serves to exacerbate the problems that rural low-income areas have in terms of financial and management capabilities. We spoke to State Revolving Fund staff throughout the country and we also looked at loan portfolios to try to get a better understanding of who has been able to borrow from the fund and the nature of those low-income projects that have been funded.

We found that most States are issuing a majority of loans to larger, more creditworthy municipalities in order to meet their financial management obligations under the Clean Water Act. Because rural and lower income communities tend to lack bond ratings and have limited debt repayment ability, they are considered greater credit risks.

Our findings show that the greater financial scrutiny in the SRFs highlights the dilemma faced by many rural communities. While they don't have the means to finance projects on their own, they can't gain access to loan funding because of their poor investment quality and limited repayment ability.

States surveyed overwhelmingly agreed that affordability is the most critical factor for poor, rural, low-income borrowing. Mr. Chairman, 23 States reported that a lack of grants makes the new program not viable for rural low-income communities; 19 States say that because of excessive per-household costs, low-income households cannot participate in the new program.

I would like to say in commendation of the SRFs that they have done a very good job in trying to make the program work for smaller communities and for lower income communities. The problem is that the States are constrained in their ability to provide interest rate subsidies without eroding the long-term lending power of the SRF, and at the same time States cannot offer the supplemental grant these communities to lower loan costs to an affordable level.

There is another problem, which relates to system operation and management. Many smaller and lower income communities cannot gain access to the loan funds either because they don't have the technical capacity to meet preliminary loan requirements, or because they have to juggle numerous requirements of different funding programs in order to put together an affordable finance package that will make the project work for them. In that process there

are a lot of time delays, a lot of red tape, and this can extend a project for years before loan financing and grant financing can be put together.

Another problem is that because these communities tend to have operation and management problems, they are not good investments from the loan fund perspective. These communities need assistance to assure that they can maintain the facilities in good working order if they are going to be good loan candidates.

I am just going to run through a few recommendations and then I will close.

Because financial and management capability have become even more critical than in the transition to loan funds, I think it is important to better identify the financing and management needs of communities as part of the national needs survey. I would recommend that the needs survey be expanded to include information on financial and management characteristics of facilities. It is very difficult to tell how many customers are served by facilities. It is just a little information about rate base and a little information about compliance history. It doesn't help us to understand more than the physical improvements and costs necessary to meet compliance requirements.

Based on this new data, technical assistance programs should be implemented to help communities improve their financial management practices and their operation.

As separate fund should be established within the State Revolving Fund that is earmarked for rural low-income communities. Funding should be offered at terms based on affordability criteria. Loan terms should be extended to 40 years. And supplemental grants should be made available, particularly in hardship cases for low-income households and for new sewer service projects.

Incentives should be provided to address the needs of on-site systems in an affordable manner. At this time there is no incentive for innovative or alternative projects. There is no incentive for lower cost technologies such as septic management. These are options that would work in rural areas and that would be more affordable.

Finally, technical assistance should be provided to rural communities to address their operation, maintenance, and management needs. Operators should receive adequate training and systems should receive assistance with capital improvements planning.

That concludes my statement.

Mr. Chairman, Rapoza Associates and the Center for Community Change thanks you for this opportunity to testify before this committee.

Mr. APPLGATE. Thank you, Ms. Paradise.

Mr. Rubin?

Mr. RUBIN. Good morning, Mr. Chairman and distinguished Members of this subcommittee. I am Robert Rubin, an extension waste management specialist on water supply and wastewater management at North Carolina State University. I am in the biological and agricultural engineering department there.

I am here today representing the Water Environment Federation, formerly the Water Pollution Control Federation where I serve as chairman of the Small Community Outreach Committee.

I formerly have been chairman of the American Society of Agricultural Engineers' On-site and Community Wastewater Treatment Committee.

I have submitted a written statement and I believe you have copies.

I am here today to address several issues that are facing small and rural communities. I have heard several times that there is such an unclear definition of what a small rural community is. In North Carolina, we use a figure of approximately 5,000 people, but that will vary depending upon location in the State. Obviously, that does vary across the country.

Mr. Chairman, 60 percent of our population in North Carolina resides in small communities and rural areas. Nationwide, that number is about 40 percent.

In North Carolina, \$1.6 billion has been spent on wastewater management facilities that were constructed under the Clean Water Act from 1978 until 1992. Approximately 65 percent of that money was allocated to projects in major metropolitan areas such as the Charlotte area, and Greensboro/Winston-Salem area, the Research Triangle area, Raleigh/Durham/Chapel Hill. Our latest needs survey that has been conducted indicates that we have \$3.9 billion in treatment costs remaining today, and 60 percent of those treatment costs are in the rural areas of North Carolina.

There are several critical issues that are facing small and rural communities. I would like to discuss some of these with you and I would like to make some recommendations concerning their implementation.

The first is the stringent water quality requirements that have been established under the Clean Water Act. They may in fact be very appropriate for large metropolitan areas and urban communities, but in some cases they are impractical and economically unfeasible for small communities with limited financial and personnel resources. As a result, these small communities frequently select a "no action" alternative.

I would like to give an example here, if I may, of the town of Stovall, North Carolina. It is located on the Virginia border with approximately 300 homes. Most of the residents of Stovall live on a fixed income. There used to be two industries in Stovall. Those industries have moved out, so their tax base has dwindled dramatically.

The homes in Stovall are served by septic tank soil adsorption systems. At any given time, 65 percent of those septic tank soil adsorption systems fail. And when they fail, untreated sewage is discharged to road ditches that course through the town of Stovall. These road ditches then discharge into major creeks that drain the area. One of those major creeks goes into the water supply serving a community to the east, and one of those major creeks drains in a southerly direction and serves a water supply to the south.

So we have untreated sewage going into surface water supplies as a result of inadequately functioning wastewater treatment facilities in small communities and rural areas.

Second, the technologies that we talk about for large communities are in fact appropriate for those large communities, but they may be very unfeasible for small communities. In a major metro-

politan area, a typical wastewater treatment process would usually consist of some kind of sedimentation—primary treatment—followed by biological, or secondary treatment. That water is then disinfected and frequently discharged to surface water.

Many communities today are looking at additional treatment strategies called tertiary levels of treatment where we remove nutrients or we add more aeration to remove more of the organic material.

Unfortunately, those technologies are very costly, they're very difficult to operate, and operators in small communities can't afford to run them. The small community can't afford to run them.

I would like to share with you a success story, if I may, and that concerns the use of alternative technology. The town of Waxhaw, North Carolina had a facility plan submitted to the State. The cost of that facility was \$4 million. The estimated user charge was \$36 per month. The university, consulting engineers, and the community worked together on an alternative collection system and alternative treatment system. The cost of that facility installed was about \$2 million and the monthly operating cost today for the sewer system is about \$19 per month.

So yes, we do have a lot of horror stories, but we also have success stories. We can utilize appropriate alternative technologies and really make an impact in small communities.

Third, I would like to talk about the public perception problem we have. Any community today that is looking at an alternative treatment technology has the impression that that somehow it is a second-class treatment technology.

Alternative treatment and alternative collection technologies are very appropriate for use in small and rural communities. They are not second-class technologies. They are proven technologies. We have a track record that indicates that these alternative technologies are good, reliable, effective, protect public health, and protect environmental quality. But we have to convince the community, the regulatory agency, and the consulting community that these are in fact appropriate technologies.

I would like to talk a little bit about sludge and residual management. All these treatment processes that we talk about are going to produce some kind of residue. We used to call that residue sludge, but we call that residue today biosolids because it better reflects their reusable nature.

Most facilities, when you talk about managing those residuals, face tremendous opposition. So one of the things that we need to look at is to improve the ability of these communities to operate over the long-term and to manage those residuals. That is the single most limiting factor in most of the wastewater treatments we have looked at: the inability to manage sludge.

Lastly, on the problem side there is a wide array of environmental mandates that are facing small and rural communities today. Wastewater management is only one of them. Wastewater management must compete with all the other mandates that are facing small and rural communities. One of the things we have heard about here this morning is that they don't have the resources to comply not just with the wastewater mandates but with the other mandates.

I have shared with you some of the problems and now I would like to share with you some of the methods you might think about to address some of these problems.

First, the Federal and State agencies must make an extra effort when they work the small and rural communities. The wastewater treatment programs for small and rural communities must be developed in an arena of regulatory flexibility which allows for the development of compliance schedules rather than demanding that today they be in compliance. Impose upon them a scheduled compliance program so that they can comply over time.

Secondly, there must be recognition of, and acceptance by, the enforcement agencies and the operating personnel that alternative technologies can be managed and can meet the unique needs of small and rural communities.

Also, we need to look at funding opportunities. These funding opportunities must be revisited to encourage investment in wastewater management programs that will help to revitalize small and rural communities around the country.

Third, in order to deal with the perception that alternative technologies are second-class technologies, Congress must fund research and demonstration programs that show that alternative wastewater management programs are not only appropriate in small communities but they are also very desirable from a public health standpoint, from an economic standpoint, and from an environmental viewpoint.

Fourth, I do believe that residual management strategies must be incorporated into overall facility planning processes. Regulatory programs, educational programs, and research programs can be developed that ensure that these technologies are developed to promote the management of residuals properly.

If small communities do face numerous mandates, we must find a way that local officials can work cooperatively with State officials and Federal officials to evaluate and prioritize local needs of public health and environmental concern and develop those into a comprehensive wastewater management program. That must be done on a risk-based basis.

The Water Environment Federation, the Cooperative Extension Service, and other agencies do stand ready to work with this subcommittee in seeking cost-effective and environmentally sound solutions to the difficult problems that are facing small communities today as they address their wastewater management needs.

Small communities do have wastewater management problems. Those problems can be addressed and we can make progress in addressing those problems. Alternative technologies are available today and they are in operation today. We must continue to develop these alternative technologies and allow for the acceptance of these technologies. We must incorporate into our programs some regulatory flexibility.

The Water Environment Federation and I do appreciate the opportunity to speak with you this morning. We thank you very much for your time.

That concludes my testimony. If you have questions, I will be happy to try to address them.

Mr. APPLGATE. Thank you very much, Mr. Rubin and Ms. Paradise.

Mr. Rubin, you talked about wastewater treatment costs of 1 percent of the average family's income as a threshold for placing a burden on the standard of living. Could you tell the committee where that figure comes from and what the national average is?

Mr. RUBIN. That is a difficult question to answer. There are some old data that came out of HUD. That data indicated that depending upon the relative income in that community, if the income was at or near poverty level, 1 percent of the income of the residents in that community could go to sewer service and another .5 percent to water service. As the income in that community increases, that percentage of the income that can go to water and sewer service does increase.

That is in the HUD documentation from a number of years ago. If you would like, I can find the exact citation for you.

Mr. APPLGATE. If you would, I would appreciate that.

Mr. RUBIN. I would be happy to do so, sir.

Mr. APPLGATE. Thank you.

Ms. Paradise, you talked about recommending establishment of a separate fund for subsidizing rural wastewater facility projects. Are you talking about entirely separate from the State Revolving Funds, or a separate account within the State Revolving Fund? How would you see this fund administered?

Ms. PARADISE. I would recommend that there be a separate account within the existing State Revolving Fund specifically for rural communities.

Mr. APPLGATE. Mr. Boehlert?

Mr. BOEHLERT. Thank you, Mr. Chairman.

Mr. Rubin, one statement just hit me like a ton of bricks from your testimony to illustrate the magnitude of the problem.

On page four you say that in some cases the construction costs of a traditional facility have exceeded the total assessed value of the community.

Mr. RUBIN. Yes, sir.

Mr. BOEHLERT. Is that true value assessment?

Mr. RUBIN. Yes, sir. Stovall is the community in point. They just built a new water system. The cost of the wastewater system to meet the permit conditions that the State and Federal Government will impose on the town of Stovall or will impose on numerous towns in North Carolina exceed the bonding capability—the net worth—of that community. And that is not just in North Carolina. I can show you communities all over the country.

If you gentlemen would like to take a little trip, we would be more than happy to arrange that.

Mr. BOEHLERT. We get in trouble every time we take a trip. [Laughter.]

Mr. BOEHLERT. You talked about the regulatory agencies needing to reevaluate the appropriateness of some of their water quality standards, especially in the context of small communities. Are there some standards that you feel are inappropriate? Could you identify some of them?

Mr. RUBIN. Some of the small communities that we have in eastern North Carolina and in western North Carolina have require-

ments for nutrient removal. We have communities with 350 or 400 homes that essentially have nutrient requirements imposed upon them. The cost of nutrient removal is in addition to all the costs of primary treatment and secondary treatment.

In those cases, we have found that spray irrigation systems and some of the alternative treatment technologies are very cost-effective for them. And through the use of these alternatives we have been able to meet those stringent water quality standards. But if you rely on conventional in-plant treatment processes, those processes are so costly that the small communities simply can't afford to build them and they can't afford to operate them.

Operating funds come out of their local budget. There has historically been no grant available to operate a system. There has been some available to construct, but none to operate. When you look at the energy costs and the chemical costs, they are phenomenally high.

Did I answer your question, sir?

Mr. BOEHLERT. Yes.

Ms. Paradise, would you care to comment on that?

Ms. PARADISE. In terms of the affordability of the operation?

Mr. BOEHLERT. Yes, and the appropriateness of some of the regulations.

Ms. PARADISE. I am not an engineer and I don't feel that I am in a position to comment on that.

Mr. BOEHLERT. Let me ask you a couple of questions, if I may.

One of the things that the GAO recommends is that we authorize a longer period of repayment for the SRF. What do you think about that? Do you think that makes sense?

Ms. PARADISE. I think that makes a lot of sense, particularly for rural facilities because their expected lifetime is actually longer because of their smaller capacity than larger facilities. I think States probably have the knowledge to know how long is long enough.

Mr. BOEHLERT. What are we doing now? What is the repayment period? Is it 20 years?

Ms. PARADISE. Yes, sir.

Mr. BOEHLERT. Do you have a recommendation? Would it be 30 years?

Ms. PARADISE. I would say up to 40 years is reasonable, depending upon the technology.

Mr. BOEHLERT. Another question I would like to ask is, What about using SRF funds to pay for sewer lines? What do you think about that proposal?

Ms. PARADISE. To some extent, they are used for sewer lines now. The problem for rural areas is that the sewer lines tend to have a very high per household cost because of the population settlements. So they are not a very good loan item. They tend to be an area where communities need a greater subsidy in order to make them affordable.

I see no reason not to use the loans for that.

Mr. BOEHLERT. Mr. Rubin, do you agree?

Mr. RUBIN. Yes, sir, I do. I think the other important thing is to look at the appropriateness of the collection technology in the small community. Well over half of the cost of a system can be in the col-

lection system. We have alternative collection technologies today that will help reduce those costs significantly.

Mr. BOEHLERT. You both heard Ms. Long's testimony. The key word I got from that testimony was flexibility. You are arguing along the same vein, aren't you?

Ms. PARADISE. I think there has been a tradition of building urban projects in rural areas. I don't think that is necessary. Flexibility wouldn't be the term I would use, but I think it is more appropriate technology.

Mr. BOEHLERT. Thank you both very much.

Mr. APPLGATE. I am going to have to call a recess. I know we have a couple of Members who do have questions.

We have about 7 minutes. We have one of the great important journal votes. If we could run over and run back without wasting too much time, we will get started immediately, if you will just hang in there with us.

[Recess.]

Mr. APPLGATE. The subcommittee will resume.

Mr. Poshard?

Mr. POSHARD. Thank you, Mr. Chairman.

Mr. Chairman, I apologize for being late to the subcommittee this morning. I came in this morning and the plane was late.

I do not have a question, but I do have a comment to Mr. Rubin and to Ms. Paradise.

I serve a rather large, sprawling district in southern Illinois that is mostly a coal mine area and rural areas. We have been a part of the Lower Mississippi Delta Caucus for the last 3 years, which then Governor Clinton—now President Clinton—chaired. Many of the counties in my district that I represent, as you may be aware, have unemployment rates in excess of 25 percent and have had for years. The municipal governments in that region and in the Lower Mississippi Delta region all the way to New Orleans don't have a chance in the world, for the most part, of affording a \$2 million to \$3 million upgrade in wastewater treatment.

So this gets to the heart of one of the most serious problems we have in that long stretch of what is now the poorest area of the country. I would hope that you folks would work with this committee in whatever way you can to elaborate especially upon the financing mechanisms that we need to get in place for these types of poor, rural communities.

Right now, whatever we have isn't working. I am hopeful that you can work with us in coming up with a list of options that we might get to the President should an infrastructure program evolve here as part of the economic stimulus package with regard to wastewater treatment and so on. This is something that is critical to the needs of the poorest areas of this country. We really need your support and your help in coming up with appropriate solutions here.

Thank you.

Mr. RUBIN. Thank you.

Mr. APPLGATE. Thank you, Mr. Poshard.

I totally agree with your statement because you come from an area very similar to mine. We know what the problems are and we know what the needs are. We know that we need some help. We

are hopeful that upon completion of legislation we will be in a position to receive that. I think it is time.

I would say that if you would, Mr. Hamburg did have a question. If you would be so kind as to stick around for a few minutes, I am going to call the rest of the panelists up. If you wish, you can maintain your seats. That is okay.

But before we do that, Mr. Gilchrest has a question.

Mr. GILCHREST. Thank you, Mr. Chairman.

I will take less than 5 minutes.

We are talking about a huge burden of cost. I come from a very rural area. There is one town in my district where there are 100 houses and every septic tank is failing—every single one. And their income is very low, so conventional methods are out of the question, whether it be a sewage treatment plant constructed with or a SRF monies, or anything. They need a pure grant, but in light of the deficit crisis, that is a difficult thing.

So we have to come up with a funding mechanism. Maybe it can be something where you can mix grant funds into a community like this that would lower their monthly payment cost, extend it out in a different way than you would a community of 3,000 that has a higher median income.

I think that is possible for us to be flexible in that manner.

We are going to have to do this right. We're coming up with some type of funding mechanism—and we also need to really look at your ideas of alternative solutions to these problems as opposed to conventional urban type sewage treatment plants—and I think we can do that if we pay close attention to all the problems and the detail.

But there is another dimension to this, then. If we follow the concept of a watershed management plan, we run into additional difficulties. I, myself, am inclined to go along with a watershed management plan because I think then we can work out the differences between States and the problems we have with the potential property rights concerns.

What is your sense of this problem, which is huge, adding onto this list of difficulties, creating a wastewater regional type of plan?

Could you both respond quickly?

Ms. PARADISE. When I think about something like a watershed-based approach, I think that is a very logical and appropriate way to go about trying to deal with water quality problems and to get it, some of the complexities in terms of regulations and mixing of different media and standards and planning.

When I listened to your remark I was really struck by the fact that part of what is very important to focus on here is the assistance that is provided to these communities in the process that they go through in deciding what the appropriate facility is for them and the appropriate management entity, and on and on with this decisionmaking. I think that becomes all the more important when you start to look at situations like the one you described where a conventional system isn't going to be practical or affordable. It isn't a long-term solution.

My answer is to say that a more planning-intensive and technical assistance-oriented approach—which is something that fits in

well with watershed management—makes a lot of sense in addressing that kind of problem.

Mr. RUBIN. I agree. I would also like to add to that. I think it is very important to look at the management entity that can function on a watershed basis, especially if that watershed basis crosses multiple jurisdictions—either city lines, county lines, or State lines. One of the things I believe needs to be addressed in legislation is enabling these communities to work across those jurisdictional boundaries. There are restrictions to that.

The technology is not the problem. There are good technologies. The problem is, How do we manage that technology? How do we get that technology adopted?

Mr. GILCHREST. Just off the top of my head, it seems that when you're going to pass along information from town to county to State to another State, everybody is going to benefit. If their purpose is to solve the problem, the flow of communication is very useful. From a rural area—they don't even know what a sewage treatment plant looks like let alone what may be a bermed infiltration pool as a possible alternative. So if we take the watershed approach, that sharing of information would be very useful.

Thank you.

Thank you, Mr. Chairman.

Mr. APPELATE. Thank you, Mr. Gilchrest.

Thank you, both. That was very useful information.

[The following was received from Professor Rubin:]

Mr. Joseph A. Italiano  
Committee Editor  
Subcommittee on Water Resources and the Environment  
Committee on Public Works and Transportation  
Suite 2186  
Rayburn House Office Building  
Washington, DC 20615

Dear Mr. Italiano:

On ~~March~~<sup>FEB.</sup> 23, 1993 I testified before the House Subcommittee on Water Resources and the Environment. My testimony was regarding the wastewater treatment and disposal needs of small and rural communities. During my presentation, several questions arose. Questions were from Representative Applegate and Representative Boehlert. The purpose of this letter is to provide written documentation concerning these questions.

Representative Applegate had questions concerning the economic viability of wastewater management programs in small communities. I mentioned during my testimony and in my written comments that the hardship begins in some communities at 1.0 percent of the median annual income. The United States Environmental Protection Agency Office of Water Programs and Operations publication entitled, "Construction Grants 1982 (CG-82)" (Interim Final Report, EPA 430/9-81-020, July, 1982) indicates that a hardship results at 1.0 percent to 1.75 percent median income depending upon median community income. See document "A" attached (pgs. 47 and 48).

The criteria for consideration as an expensive project by EPA is 1.0 percent when the median income is under \$10,000, 1.5 percent when median income is between \$10,000 and \$17,000 and 1.75 percent when median income exceeds \$17,000. These values reflect 1980 dollars and can easily be adjusted for today's average incomes. I have enclosed a very rough section of a draft report on which I am working to help clarify economics. See attachment "B."

I hope this information satisfies Representative Applegate's question. If he desires additional material or information, please feel free to contact me.

Mr. Joseph A. Italiano  
Page two

Several other questions were posed by Representative Boehlert. He questioned the appropriateness of water quality standards for small communities and asked which were inappropriate. The wastewater treatment standards which require removal of high levels of organic material (removal to a treatment level of 5 milligrams per liter of biochemical oxygen demanding material) may be cost prohibitive for small communities. Further, some nutrient removal standards may impose significant financial hardship on small communities. Many small communities today face phosphorus limits of less than 1 milligram per liter in the discharge and removal of phosphorus to this level may also create significant financial burden for small communities. This burden is realized both on the construction side of the project and on the long term operations and maintenance side of the project. For several years, I have been advocating a program of regulatory flexibility. Small communities today face numerous mandates. Environmental quality programs are only one of several mandates facing small communities. A program which allows regulatory flexibility will permit small communities to develop a compliance schedule for environmental quality programs of most benefit to that community. Further, water quality standards should be re-visited as they relate to small and rural communities. When the potential impact from a small community is compared to the impact from runoff from agricultural operations, then the input from the small community is minuscule compared to that of the immediate environment. Pollutant trading between agriculture and municipalities may "trade" pollutant and achieve improved water quality. Development of this regulatory flexibility will foster compliance and help to maintain the economic viability of the small and rural community.

The level of funding necessary to support alternative treatment technology research and development efforts is high. Water quality models should be re-examined as they relate to communities with fewer than 10,000 residents. A nationwide standard should be established for the various alternative treatment technologies and this can only be done through a comprehensive research and development effort. Such a research and development effort could be centered around three or four Regional Centers of Excellence. Each Center could receive an initial budget of 1.5 to 2 million dollars. Operating expenses at each Center could be as high as 1 million dollars for the first four or five years of the operation. Following that initial funding and annual allocation, the Center would be expected to develop regionalized training and demonstration efforts which would then be self-supporting. The initial cost for this research and development effort would be approximately 10 to 12 million dollars with an allocation of approximately 2 million dollars per year for the next three or four years. A centralized coordinating committee would be necessary to coordinate research activities and this function could be accomplished for .5 million dollars per year and at the end of the four or five year development stage, the activities of the coordinating council would then be self-supporting.

Mr. Joseph A. Italiano  
Page three

The concept of Regional Centers of Excellence will allow for development of wastewater management programs that are specific to unique climactic, geologic, and natural resource conditions in the various physiographic regions of the country. A single center to promulgate research and development activities will prove to be ineffective because of its inability to accommodate unique needs dictated by regional conditions.

I hope this information is helpful to you and the members of the Committee on Public Works, Transportation and the Environment. The Water Resources and Environment Subcommittee is genuinely concerned about these rural infrastructure issues and I commend them for their interest. Rural communities are eager to comply with environmental mandates but the myriad of mandates makes compliance costly and difficult. The development of a rural infrastructure program which could facilitate compliance is vital to the viability of rural communities nationwide. If the Cooperative Extension Service, the Water Environment Federation, or the professional groups concerned with environmental quality and environmental management can provide additional information to you and the members of your committee, please feel free to contact me. Thank you for your interest in rural communities. I look forward to working with you and to hearing from you soon.

Sincerely,

A. R. Rubin, Extension Specialist  
and Associate Professor  
Biological and Agricultural Engineering  
Chair, Water Environment Federation  
Rural Community Outreach Committee

allocations. However, some projects involving revenues from cogeneration of energy in the form of steam or methane may qualify for a limited exception. If an energy cogeneration project involves the sale of energy rather than its reuse within the plant, then anticipated revenues may be used in cost calculations up to a maximum of the net value of energy (revenue less cost of plant reuse) that reasonably could have been reused within the wastewater pollution control components of the proposed project.

## 7.1

**ADDITIONAL CAPACITY** Although you may propose additional capacity beyond the allowable reserve (Section 5.5), it is not grant fundable. After October 1, 1984, grant assistance will only include costs for the capacity required at the time of grant award, not in excess of needs as of October 1, 1990. After identifying the cost-effective alternative, you should address the proposed "additional capacity" alternative in the same detail. Special emphasis should be placed on the environmental impacts, including indirect impacts, of the proposed project..

The allowable cost is equivalent to the estimated construction costs of the most cost-effective treatment works (conveyance and treatment plant). Estimate the costs of construction of the additional capacity alternative and the cost-effective alternative on a consistent basis. You should use recent cost curves published by EPA, Office of Water Program Operations (i.e., MCD-10, MCD-53, FRD-11, FRD-21, FRD-22) to determine the cost ratios of a cost-effective project

components and those of the additional capacity project. Multiply your cost ratios by the construction contract costs for the additional capacity alternative to determine the incremental eligible costs of the additional capacity.

Although grant assistance only funds a portion of the project, the review and approval process will be the same as for a fully allowable project. If the environmental impacts of any portion of the project are unacceptable, grant assistance will not be awarded for any project costs.

When you receive the grant offer, it may include special grant conditions to protect the Federal government from any further claim due to additional capacity. Note that the user charge system applies to the entire project including the part providing the additional capacity.

## 7.2

**DEMONSTRATION OF FINANCIAL CAPABILITY** To ensure proper construction, operation, and maintenance of treatment facilities, it is essential that the community be able to raise sufficient capital and operating revenue.

The facilities plan includes a monetary analysis of the total resource cost of the principal alternatives. In addition, an explicit analysis of the financial constraints that limit a community's ability to finance, operate and maintain the facilities performed early in the planning process can be an effective screening tool in the cost-effectiveness analysis, and can meet the requirement to demonstrate your financial capability for the useful life of the project as a part of your grant application. During

facilities planning this estimate of financial capability will ensure that the local government agencies and residents are aware of their total financial obligation. These financial costs are identified for the selected plan and should be presented at a public meeting.

A financial capability analysis will help answer six key questions:

- o What is proposed in the facilities plan?
- o What roles and responsibilities will local government have?
- o How much will the facilities cost at today's prices?
- o How will the facility be funded?
- o What is the average annual cost per household?
- o What is the community's financial capability?

The identification of the costs to the community, reflected in the charges to customers, includes user charges and other costs such as debt service on any existing system, debt service on the local share of new capital costs (you should use actual or expected interest rates when calculating debt service), annual O&M (including replacement) costs, and connection charges (Section 7.0).

Analysis of the financial characteristics of a community can include existing debt, revenues, assessed value of property, median household income, income distribution, rate of population growth, bond ratings, existing sewer system charges, planned capital expenditures, and other factors and trends. The analysis is applicable to community

systems and communities that are party to an intergovernmental agreement (Section 8.5.1).

Information on these costs should be developed as part of the draft plan of operation (Section 12.4) and user charge system (Section 12.2) required before a Step 3 grant will be awarded.

To assist you in this analysis an example summary information sheet is included in Appendix E of this book. Your State may have modified this sheet to better reflect local conditions. In any case, the information on the sheet you use will accompany your eventual application for a Step 2+3 or Step grant to demonstrate your community's financial capability. You should revise the information to reflect improved cost estimates and current community financial characteristics after design.

The financial capability analysis is especially important to determine a small rural or semirural community's ability to pay project costs (Section 7.2.1). The recently published Financial Capability Guidebook is available from EPA to further assist you.

Projects that appear to be expensive should receive careful review. We suggest that the criteria below be used to help identify expensive projects regardless of when the project was initiated. Calculate total annual charges to customers (after Federal and other funding is determined) for wastewater facilities. Include debt service, connection costs, and O&M. EPA considers the project expensive when the total annual costs exceed the following percentages of annual household median income (1980 dollars):

- 1.0% When median income is under \$10,000.

1.5% When median income is between \$10,000 and \$17,000.

1.75% When median income exceeds \$17,000.

(Use the consumer price index to adjust income data from other years and the dollar ranges in the table to the year of your most recent cost estimates, or adjust project cost and household income to 1980 values. See Appendix F).

Where identifiable, you should also consider the effects of projected charges to customers in areas with household incomes below the poverty level. If your project appears likely to be expensive, you should also:

- o Review the cost-effectiveness analysis to ensure that lower cost alternatives have not been overlooked and that estimates are adequate and accurate;

- o Determine whether high costs are due to water quality limitations and requirements of advanced treatment processes. If so, reconsider alternatives;

- o Review soundness of local share financing of project;

- o Pursue other funding sources.

It may be possible to reduce the local share of capital costs by using funds available from State and Federal agencies, such as Farmers Home Administration and Housing and Urban Development. Requirements for funding from other agencies' programs will vary and some communities may not qualify. A thorough investigation during facilities planning of all possible sources of funding will ensure that the local share is available. Be sure you have a firm commitment from any funding source.

#### 7.2.1

ASSURING LOW COST PROJECTS FOR SMALL COMMUNITIES

Per capita costs for conventional sewerage projects are frequently higher in small communities (flows less than 1 mgd) partly because of the size and distribution of their population. Small communities have fewer financial and management resources from which to draw. These circumstances make it critical that low cost, especially low O&M cost, technologies be selected. You can use the following two-phase screening to help select the technology for your project. The first phase determines the technology selected and exempts from further review those that involve one or more of the following:

- o Onsite and cluster systems;
- o Facultative ponds;
- o Overland flow land application;
- o Trickling filters;
- o Rehabilitation, expansion or upgrading of any of the above;
- o Upgrading the operation, maintenance, and management of existing facilities as an alternative or supplement to construction of new facilities.

The second phase of screening involves an operability assessment and the application of problem project indicators. (Projects in the construction stage as well as operating projects should also undergo a financial capability analysis if not performed previously.) The operability assessment evaluates the operational and maintenance requirements of

### Can Your Community Afford The Proposed Wastewater Treatment Facilities?

The financial capability of a community is the measure of its existing financial commitments and legal financial capacity to provide services. Listed below is a series of questions that will provide information about your community's financial condition and its ability to pay for the proposed facilities. The answers will give you a "snapshot" of the financial resources at your disposal to construct, operate, maintain the proposed facility.

- Over the past five years, has your community's population been stable, growing or falling?
- What is the current outstanding indebtedness of your community?
- How much additional debt can your community legally incur?
- What are your community's property tax revenues relative to the full-market value of real property in your community?
- If your community proceeds with this project, can it still afford other proposed projects?
- What is your community's bond rating? Has it changed within the last two years?

The Financial Capability Guidebook has an added supplemental section to assist you in finding and interpreting the answers to these and other questions. Collectively, the information will provide assistance – but not the answer – to whether your community has the financial capability to undertake the proposed project.

EPA has developed a screening system to help insure the selection of an appropriate wastewater treatment option. This system is based on an analysis of thousands of projects in EPA's biennial survey of needs. The purpose of this system is to help your community identify problems at an early stage when they can be more easily resolved.

The EPA screening system consists of six financial indicators and has two parts. (See below.) Part A measures the reasonableness of your project's costs and sizing based on national experience. The cost indicators reflect what your community would pay to build the facilities without funding. Part B is a measure of the net cost of the project to the existing households. These costs assume a 25 percent local share of the project capital cost. [verify with North Carolina criteria/ So how does this last sentence affect the numbers?]

**[UPDATE ALL FIGURES BELOW]**

Part A: Project Capital Costs and Sizing

<u>Indicator</u>	<u>Suggested Criteria</u>
Capital cost of sewers	\$4,000 per household
Capital cost of treatment	\$3 per gallon per day of capacity
Total Project Capital cost	\$6,000 per household
Allowance for future flow	50 percent of initial flow

## Part B: Cost to the Residential Customer

<u>Indicator</u>	<u>Suggested Criteria</u>
Annual Operations and Maintenance Costs	\$100 per household
Annual household cost	1.5 percent of median household income

The values of these indicators for your project are compared to the criteria based on national data or [to North Carolina's criteria?]. [verify] Both parts of the screening system are important; both the total cost of the project and its net cost to each household must be within acceptable limits. If your project exceeds the criteria for any of the indicators in Part A or Part B, you need to take a closer look at your project so that any problems can be analyzed and resolved. See the section "Where to Go for Help" to find out who to contact for more information.

It is important to note that small communities may have user bases that are too small to effectively spread out the minimum fixed costs of building and operating necessary wastewater facilities. In such cases the only recourse is to minimize the financial burden to the greatest extent possible by reducing costs and by increasing revenues without increasing individual user charges. This is essentially the purpose of implementing a cost-reduction and self-help program.

In order to accomplish this, three key costs determinant variables must be controlled: project cost, operating cost, and revenue capacity.

The *project cost* is the total cost of building a wastewater facility including engineering fees, legal fees interest payment, and land cost, as well as construction costs. The project cost has a direct impact on total annual cost through debt service.

Factors contributing to excessive project cost are as follows:

- Inadequate consideration of less-costly collection system alternatives
- Inadequate consideration of cost-effective treatment technologies
- Failure to seriously consider operational improvements or facilities upgrading versus plant expansion
- Oversizing of facilities due to unrealistic growth projections and flow estimates
- Designing overly sophisticated facilities which are inherently expensive, energy intensive, and operationally complex.
- Failure to consider the impact of inflation on ultimate construction and operating costs
- High debt service payments
- Failure to seek most competitive bid possible

- Excessive, unnecessary construction change orders

The *operating cost* is the day-to-day cost of owning and operating wastewater facilities, including debt service, as well as operation and maintenance costs. Operating cost has the most direct financial impact on a community, and is therefore often perceived as the root of the problem in a high-cost project.

Factors contributing to excessive operating cost are as follows:

- Maintaining larger operating staff than required
- Cost of in-house administrative services (management, accounting, billing, payroll, revenue collection, and so on)
- Excessive power consumption and excessive utility charges
- Excessive use of chemicals and failure to consider use of less expensive alternative chemicals
- Excessive equipment repair and replacement caused by inadequate routine maintenance
- Costs of outside services (professional services, treatment and disposal fees, and so on)
- Cost of miscellaneous expenses (rent, supplies, vehicle maintenance, and so on)

- Overhead expenses (fringe benefits, insurance, and so on)

*Revenue capacity* is the ability of the system to generate an adequate level of funds. Factors contributing to insufficient revenue capacity are as follows:

- Inadequate user charge revenue base related to size of service population and individual user's ability to pay

- Refusal of users to connect

Inequitable user charge system (e.g., not charging non-residential users their fair share)

- Excessive accounts receivable (delinquent user fees and payments)

- Reliance on user charge revenues alone without considering opportunities to generate supplemental income.

- Insufficient budgeting resulting in underestimation of revenue requirements

- Failure to take advantage of investment opportunities.

- Diversion of revenues to pay for other services (e.g., water, road repair)

What to Do if the Wastewater Project Is Too Expensive

Mr. APPLEGATE. We will now call the next panel forward. I invite you all to the table.

We have Joe Paul Jones, President, National Society of Professional Engineers; Paul F. Sprehe, President-Elect, American Consulting Engineers Council; Tom Harnisch, Wisconsin Towns Association, National Association of Towns and Townships; and Joseph Siragusano, Board Member; Ohio Rural Water Association, representing the National Rural Water Association.

I see that there are some time limits that we are working on here. I am going to take that person who needs to catch a plane first. Then we will go from there.

We will begin with Mr. Jones.

**TESTIMONY OF JOE PAUL JONES, P.E., PRESIDENT, NATIONAL SOCIETY OF PROFESSIONAL ENGINEERS; TOM HARNISCH, WISCONSIN TOWNS ASSOCIATION, NATIONAL ASSOCIATION OF TOWNS AND TOWNSHIPS; JOSEPH SIRAGUSANO, BOARD MEMBER; OHIO RURAL WATER ASSOCIATION, REPRESENTING THE NATIONAL RURAL WATER ASSOCIATION; AND PAUL F. SPREHE, PRESIDENT-ELECT, AMERICAN CONSULTING ENGINEERS COUNCIL**

Mr. JONES. Mr. Chairman and Members of the committee, thank you very much. We appreciate the opportunity for NSPE to testify on this very important subject. My name is Joe Paul Jones and I have a consulting engineering firm in Fort Worth, Texas that is approximately 100 years old. We have worked with small communities throughout the State of Texas since the first time sewage treatment was known to this country.

The National Society of Professional Engineers, of which I am president at the present time, consists of some 75,000 members. We were founded in 1934 and have 535 chapters, with a State society in each of the 50 States plus 4 territorial societies.

I could give you a number of horror stories about the things that we have encountered in small communities and I am sure the Members here have heard many similar to that. We have a 9-page statement which I have no plans to read, but I know all the Members do have a copy of that.

One thing that I would like to say is that we as consultants, in dealing with these small communities, have to be more than just consulting engineers. As has been mentioned by a number of people so far, these communities have no staff. They may have one person they depend on, and they may not have much knowledge on how to go after these grants. So as a consulting firm, we have to have that capability in dealing with them.

We feel very strongly that the SRF is the way to go. We were pleased to have the opportunity, when this program was first considered, to appear before the committee that authorized it and work with the details. Many of those details that we thought were best have been made a part of the SRF.

Unfortunately, the SRF, as we all know, has not been funded as far as it should be and there are a few drawbacks about it that we would like to discuss. But we would like to say that it is a very sound program. I think it needs to be mixed in some cases with

grant funds or we won't have some of these small communities able to participate at all.

We should say that the small communities really have fared better under the SRF program than some of the urban communities because they have received 33 percent of the funds. So they haven't been totally left out.

Mr. Chairman, we feel that \$2 billion ought to be the minimum amount that is funded for the SRF program annually. If you could get \$3 billion or \$4 billion, that is wonderful. But as you pointed out earlier, the program was under-funded previously and we feel that \$2 billion should be the absolute minimum.

We think that these loans in cases where you have disadvantaged communities or very small communities ought to have a zero interest rate allowed by the States. The loan fund time should not be 20 years, as it is at this time. Small communities may build a treatment plant in one life span of a person. If they build a proper plant, it can certainly last for 40 years. There is no reason why the payback should be limited to 20. We would urge you to extend it to at least 30 and hopefully 40 years.

Flexibility has been mentioned today very strongly by the Chairman of the full committee. We have to eliminate the burdensome requirements of the title II grant program or it won't be possible for these small communities to meet their needs the way we want them to be met.

There is a restriction now that the money cannot be used for securing land. We think it ought to be allowed to be used for land purchases. It may be a small piece of property in terms of acreage, but it is a big piece of property to a small community, and it is a major investment and has a major impact on them. The funds ought to be allowed to be used for that.

Another point that is very badly needed—I don't know how to accomplish this, but if you can find that needle in the haystack, more power to you—eliminate some of the burdensome cross-cutting authorities that just hamstring the small communities in operating under this program.

We think that the funds should be given to the States on a cash basis rather than getting letters of credit as they have from EPA. If this was done, we think very strongly that the funds would generate more income, they would be used more rapidly, they would be repaid more rapidly, the States would be able to make interest instead of simply having a letter of credit, and the program would be more self-sustaining as it was intended to be by this Congress.

As far as the requirement of setting aside certain funds for the small communities in each State, certainly that should be done, but we feel that it ought to be up to the State since some States have much greater need for the small community set-asides than some of our urbanized States. If the same requirement is placed in this Act on all the States, then it could be totally unfair to a number of the more rural States and certainly to a number of the urban States.

Let me address the grants program, if I may, for just a moment.

We hope that you will not go back to the construction grants program ever again. However, there are many of these small and disadvantaged communities that are going to have to have at least

partial grants. They simply can't work without a grant. This could be done as a partial grant/partial loan. It could be done as a partial grant and privatization for the rest of the system as you put in the ISTEA legislation. It would seem that that would be a good idea you might want to explore.

We would urge you not to put a grants program in the hands of the Corps of Engineers or some other agency. It can be handled within the agencies where programs already exist. Of course, there are others besides EPA—the Rural Development Administration, the Economic Development Administration—and they do have program people that can handle it. We don't think the country needs to establish an entirely new program.

Those are our primary recommendations to you.

In closing, let me say that we think a revolving loan fund should be set up for drinking water and solid waste disposal, even though that is not the subject you're looking at today.

Funding of these small community facilities is very important. To design a small treatment plant takes a small amount of time. If we indeed are concerned about putting people to work quickly in this country, this is an opportunity to do it. The design can be done rapidly if we can get away from all the burdensome requirements that I have just mentioned. They can be put under contract and many of these small communities could have their problems well on the way to being solved. We think that is a good way to put people back to work as well as to solve the problem you're facing today.

Mr. Chairman, I thank you very much for your time.

Mr. APPLEGATE. I thank you for your statement and your directness. You have hit the heart of the matter.

Next we will have Tom Harnisch.

Mr. HARNISCH. Mr. Chairman and Members of the subcommittee, I am Tom Harnisch from Wisconsin representing the Wisconsin Towns Association and the National Association of Towns and Townships.

Our association in Wisconsin represents, 1,257 of the 1,266 towns. In many States, you would refer to those as townships. From the national perspective, we represent some 13,000 small communities throughout this country.

Town governments in Wisconsin represent 31 percent of the population. We have towns in Wisconsin that range from 22,000 in population to 29 people. Over 800 of the towns in Wisconsin are under 1,000 in population. So you can see that these are the very smallest of population centers.

Clearly, many of those communities do not need sewer treatment at this time. However, many of those communities do. Mr. Chairman, 25 percent of the population in Wisconsin live in areas that are currently un-sewered. Many of those communities, as would be the case nationally, are communities where their sewer needs currently go unmet.

Let me give you a description of the typical communities that exist in Wisconsin where the needs are going unmet. I think in many, many States throughout this country these three types of communities also exist.

The first community is the so-called crossroads community. In Wisconsin, those are unincorporated towns or small villages or

very, very small cities that are un-sewered or their sewer system is clearly inadequate. That is the community where the grocery store is there, the tavern is there, and a few people have harbored around there and maybe a feed mill that may or may not still be in business. That community is one of the typical communities we're addressing here today.

The second community is the lake front or river front community that runs throughout Wisconsin where there are 15,000 lakes and the Mississippi River and what have you. Again, those of you from other States can visualize those communities as well. Again, many of those communities are totally un-sewered, or their sewer facilities are clearly antiquated.

The third community, and the one oftentimes most controversial within political circles within the State, are the residential settlements that surround large cities or large villages. These are the communities that you may even refer to as suburbs. They are un-sewered but they are able to be connected to a sewer system but for the fact that there are political problems between that particular small community—whether it be a town or small village or what have you—and the larger community controlling the sewer system.

So the problems currently are not just those of this committee and this Congress appropriating the necessary money to deal with the issues of grants versus loans, but also to look very seriously at the political structures that are withholding current sewer treatment because even though we may have tremendous public health needs and tremendous environmental needs, and you may provide the appropriate appropriations dollars, you still may be in a situation where those dollars by this fall may never get to these communities because of the political problems back home.

What are some of those political problems?

The first major political problem in many States is that some of these communities cannot get sewerage because the community that controls the sewer will not allow it to be brought without annexation or without a major long-term contract with that community. The people who live in that town or small unincorporated area may not want to be annexed. So the first political problem is: Do we put Federal and State money into a community where they in fact withhold sewer from part of that serviceable community?

The second problem is that many States have a non-proliferation policy regarding sewers. That is, they want major metro sewers because of their efficiency. One can understand that. However, for many, many communities, that means running major lines for very long distances if they can't have their own sewage treatment plants.

We have been discussing here today some alternative treatment systems. I can tell you that in Wisconsin those systems are not highly thought of and the State Department of Natural Resources does not look with any form of enthusiasm at those alternative systems. They are basically looking at a non-proliferation policy with major sewer systems connected to major cities and major villages.

The third one is this funding/grant issue. I can tell you from the studies I have done lately in Wisconsin that many, many communities cannot afford a sewer treatment system. In Wisconsin, they

have a hardship fund for some of these very, very poor communities that adds on to the Federal dollars this committee appropriates. I can tell you that of the 24 communities that were hardship in Wisconsin that State additional funding picked up 2 of the 24. The other 22 that are miserably poor economically are not going to get any type of sewer treatment by Federal and State dollars combined.

So if this committee is considering moving major sewer treatment into those communities, I can tell you that they are there, but they are extremely poor and they need every dollar you can muster to get them sewerred.

Again, I mentioned the fourth concern is that alternative systems are not approved in many States.

What are the solutions? I suspect the first one is certainly a set-aside for small and distressed communities, targeted aid to meet the most needy communities' needs in this country. I think the report from the GAO pointed that out. In Wisconsin, there are certainly many, many communities that are targeted, but there is not adequate funding. Again, I want to urge you to look at these alternative systems but to make sure that these States will accept these systems.

Third, the annexation requirements. I believe, frankly, that if this committee is going to appropriate money and if Congress is going to approve this money, that communities that are within the service area should not have to suffer annexation in order to get sewer treatment.

Again, I would echo what people have said about training and allowing for the flexibility within these programs.

I thank the committee for their attention in this matter. This is an extremely important issue for rural Wisconsin and for rural America. We hope that you get about your business of facing this major issue.

Thank you very much.

Mr. APPLGATE. Thank you very much, Mr. Harnisch.

Mr. Siragusano?

Mr. JONES. Mr. Chairman, I apologize for having to leave because I do have a severe time commitment, but we would certainly welcome any questions that you have. I would be glad to answer those in writing to you at any time. We appreciate your time here.

Mr. APPLGATE. I might say to each of you that we will be submitting questions and we would ask that you promptly reply to those questions. We can save time today.

Mr. HARNISCH. Mr. Chairman, I have that same problem. Thank you very much.

Mr. APPLGATE. That is fine. Thank you very much.

Mr. Siragusano?

Mr. SIRAGUSANO. Thank you, Mr. Chairman.

As a board member of the Ohio Rural Water Association and member of the National Rural Water Association, I want to thank you for the opportunity to address the committee today. It is an honor and a privilege to appear before the Subcommittee on Water Resources and the Environment.

First I would like to take this opportunity to introduce myself. My name is Joseph Siragusano and I have been the director of san-

itary engineering for the Jefferson County Water and Sewer District in Ohio for 27 years.

I am here on behalf of the National Rural Water Association and its 45 affiliated State rural water associations and their 12,000 member water and wastewater systems. Each State association provides training and on-site technical assistance in solving operational and maintenance problems to rural and small communities. During the course of the year we provide 45,000 on-site types of assistance.

Speaking on behalf of rural America, I would like to express my gratitude for your support and concern for the welfare of the people of rural areas. During my 27 years of employment with Jefferson County, I have encountered many difficulties and hardships placed on the county government's water and wastewater systems. These problems and burdens commonly get passed onto the customers we serve.

I have come here today to express our support for a clean and safe rural environment. A safe environment must include the proper and safe treatment of wastewater.

Sewage treatment, in particular, is a problem because many small communities lack funds for projects as well as the competition between small and large communities for scarce Federal funding. As you know, smaller communities received a disproportionate amount of grant program funds before 1987 and now are solely dependent on the loan funds.

To solve these pollution problems, we need a new grant program specifically categorized for small communities rather than all EPA funding going to revolving loans. Our area is just one example of a typical rural community. Economically speaking, the area is under great financial stress. Jefferson County is basically a blue-collar workforce, primarily supported by the steel industry. At the present time, many of the area's residents are laid off from the steel mills as well as other plants and manufacturing companies. Therefore, as numerous studies have indicated, the income for rural areas is quite low and Jefferson County is no exception.

Before I reflect on some past and current problems facing my community I would like to acknowledge the support and concern this committee has shown in dealing with the sewage problems of rural America. The Rural Water Association greatly appreciates your dedication to the cause for bettering the health and living conditions of rural residents.

As you know, in 1973 the Clean Water Act was passed by Congress to clean up our rivers and streams of pollution. I would like to briefly comment on my personal experience with past grant programs that were initiated in the 1970s as part of the Clean Water Act and continued until 1987.

In order for a community to qualify for the 75 percent grants, each county, city, or village had to do a facility plan study for areas that were in dire need of sewer collection systems or wastewater treatment plants. For example, in Jefferson County approximately 15 facility plans were completed and put on the priority list of the EPA for qualifying for grant monies. Out of the 15 projects, Jefferson County did not qualify for any grant monies.

With all good intentions, the grants did not help many rural areas with pollution problems. Most of the money was received by the large cities and thus eliminating small village and county projects.

After the grant program was phased out in 1987, Jefferson County was notified that we could not comply with the Clean Water Act provisions. Soon after this we were referred to the Ohio Attorney General's Office for a consent of decree. Also we were informed that a civil penalty was imposed on Jefferson County for not complying with the NPDES permit. At this time we were instructed by the EPA to bring our plan into compliance within 2 years.

The cost of compliance was extremely costly and no funds were available through the grants. Our only available funding was through the SRF.

The mandate imposed on us gave us no other alternative than to raise the monthly minimum sewer rate on the residents. To meet the EPA requirements on upgrading our wastewater facility plant we had to increase our rates 500 percent. As you well can understand, the 500 percent increase was met with extreme outrage by the approximately 2,000 homeowners in the community. Many of these homeowners are on fixed incomes and currently experiencing difficult financial hardships due to the local economy.

This is only one example of rural America not being able to keep up with increasing regulatory burdens. I am certain many similar rural communities have experienced the same difficulties as Jefferson County.

Mr. Chairman, at this point I would like to mention a few other sewage problems facing rural communities.

First, for rural areas on-site sewage treatment often does not solve the wastewater problems. Second, installing new septic tanks and leach fields are not viable for many areas because soils are not suitable for leach field operations. Third, conditions exist today with actual raw sewage being run into ditches in rural areas. These raw sewage problems often put our children's health in danger. Many rural residents do not have public water supplied to their houses, thus relying on wells which can be contaminated from septic systems.

Currently we have numerous areas that need sewer construction because of mandates by the Ohio EPA. Without additional Federal assistance our estimated minimum cost per user of these projects is between \$80 and \$90 per month. As you can see, without additional financing assistant these projects cannot go forward. The only funding available is loans. Obtaining loans does not reduce the construction costs to the point of affordability for our customers. It is evident that what is a reasonable cost for a large metropolitan or regional public sewer system may not be reasonable for a small sewer system which serves relatively few users.

We should also note that in many cases, especially in rural systems, consolidation may not be possible or even desirable because of the distance between communities and homes. The need for more Federal financial assistance grows each year as Federal regulations increase the amount of environmental requirements on small wastewater systems.

In closing, Mr. Chairman, I would like to reiterate that without the assistance of the Federal Government the development of new systems and the expansion of existing systems will be very difficult to carry out. Federal regulatory requirements are dramatically increasing the cost of managing rural water and wastewater systems. Small communities have gone to their State governments for help only to be told that only loan funds are available.

I would like to thank all the Members for your efforts in providing the best possible living conditions for rural Americans and urge you to initiate a wastewater grant program for rural America.

Thank you.

Mr. APPLGATE. Thank you very much, Joe.

I would like to mention at this point that I know Joe Siragusano and I have known him for a great number of years. There is nobody that I know in the State of Ohio or anyplace else who runs a more efficient office than does Joe Siragusano. He does it with extreme quality and has done an excellent job. But he is limited.

Of course, I know what he is talking about because Jefferson County is my county. That is where I come from. I know what he is saying is absolutely true. I think that reflects so much of what rural America and the small communities are facing today. I think he very succinctly points out the needs and the need for a grant system.

Hopefully, we will be able to address that very positively before we get through this year. I appreciate your remarks on that.

Mr. SIRAGUSANO. Thank you, Mr. Chairman.

Mr. APPLGATE. Mr. Sprehe?

Mr. SPREHE. Thank you, Mr. Chairman.

I appreciate the opportunity to be here today. My name is Paul Sprehe. I am chairman of PSA Consulting Engineers, which is a small consulting engineering firm in Oklahoma City. Like Mr. Joe Paul Jones, I, too, am a registered professional engineer.

At the present time I also happen to be president-elect of the American Consulting Engineers Council, which is made up of some 4,500 consulting engineering firms employing 180,000 engineers and scientists. Many of the projects that consulting engineers do every year, which probably amount to \$100 billion, are for the small towns and rural communities in this country. So I think we are intimately familiar with the urgent needs of rebuilding the sewage systems or providing for the needs of the sewage systems in those communities.

As you indicated in your opening remarks, Mr. Chairman, there are countless examples of deteriorating sewage treatment plants and other water facilities throughout this country. Recent statistics from the EPA indicate that there are some \$10 billion to \$12 billion of projects that are on the shelf ready to go in this country. Of that \$12 billion, Mr. Chairman, \$136 million are in your home State of Ohio alone. The needs are obviously astronomical and Government should be working with the private sector through partnering efforts if we are to experience a true revitalization of environmental infrastructure.

With the obvious backlog in sewage treatment design and construction projects currently on the shelf, the private sector must be called into action to provide quality design and construction serv-

ices. Our member firms have been working closely with many Federal agencies, but we as a group do oppose the intervention of the public sector into the design industry. Many of our engineering firms are still struggling with the recession themselves and yet are facing competition from the public sector.

Rural communities and small towns in this country are somewhat on the horns of a dilemma. There is no argument that the needs exist. However, the technology and the affordability of these facilities are beyond their limited means to meet their share of the capital costs as well as the operating and maintenance costs.

The choice of technology for wastewater treatment for small communities is a function of many factors. As someone said earlier today in their testimony, the conventional way of collecting sewage and running it to a treatment plant is through sewer lines that have to run downhill. That is one of the first things that I learned in engineering school. When you have to go long distances, especially in hilly country, some of those sewer lines have to be put in trenches 20 and 30 feet deep. You can imagine the astronomical cost of having to lay those sewers, and even greater cost to maintain them at that depth.

We would propose that more innovative collection systems be authorized. Pressure systems or vacuum systems where you use smaller plastic pipe have been successfully used many places in this country. They can be installed in shallow trenches and they do not have the severe alignment problems that the conventional gravity sewer requires. Furthermore, they are not as sensitive to peak load or wet weather conditions.

I noticed in the morning newspaper that President Clinton is calling for the use of innovative technology in partnership with the private sector. This is a perfect example of where that innovative technology can be utilized.

ACEC would like to suggest in response to the suggestion about grant programs that the Congress begin a demonstration project grant program where selected small communities are authorized to use innovative technology at less cost for the solution to their wastewater problems. Then the results of that technology should be disseminated to the rest of the country to illustrate the effective use of innovative technology.

We had a situation here last year where one of our member firms won an engineering excellence award for the innovative design in South Carolina where a wetlands project was used for wastewater treatment solving two problems at the same time at very low cost. Such a grant program, in our view, would be very innovative for the Congress and we think very cost-effective.

ACEC has supported and continues to support the use of the SRF as being probably the best use of the Nation's funds to fund wastewater projects. However, sad to say, the administrative burdens on the small towns and rural communities have not permitted them to be as active a participant in the revolving funds as they could be. We would like to suggest that some easing of those administrative burdens be considered by the Congress.

We also note that there are excessive Federal requirements and regulations in such areas as the use of the Davis-Bacon Act, which in my own experience do not apply in small towns. We had a case

in Atoka, Oklahoma where a water system badly needed to be built in which the Davis-Bacon wage rates were imposed. I guarantee you that those plumbers and workers in Atoka would have been glad to work at \$8 an hour rather than the mandated \$15 an hour that the Davis-Bacon law requires. We think that the easing of the requirements would create more jobs and be a better use of the country's money.

We think small communities can be helped through administrative remedies such as easing of the section 201 planning requirements which place restrictions on funding collectors and combined sewer overflows and hinders project design; by simplifying and streamlining the application process; by exempting small communities outside of the standard metropolitan statistical area from Federal regulations such as the Davis-Bacon Act; and by allowing small communities, through a demonstration grant program, to use alternative technologies which can be done at lower capital and operational costs.

In closing, Mr. Chairman, I would like to tell the committee what we have been doing at ACEC to help solve America's infrastructure problems. We are a founding member of the Rebuild America Coalition, which includes 57 public and private organizations committed to the infrastructure rebuilding challenge. The current chairman of that commission is Maynard Jackson of Atlanta, who has been volunteering his time and effort to help focus public attention on innovative ways to finance the refurbishment of this Nation's deteriorating infrastructure.

This plan has been presented to President Clinton and he has essentially endorsed the concept thereof.

Thank you very much for the opportunity to be here to present the testimony on behalf of the American Consulting Engineers Council. We appreciate your recognition, Mr. Chairman, that rural sewage treatment is a necessary public good and a vital element of public trust in Government. We would welcome the opportunity to provide assistance and support to you and your subcommittee as you work to ensure that America's future water needs are met. I would be most happy to answer any questions.

Thank you, sir.

Mr. APPLGATE. Thank you very much, Mr. Sprehe.

I apologize for mispronouncing your name at the beginning.

Mr. SPREHE. It happens every day.

Mr. APPLGATE. It isn't like mine. Mine is easy, but some others are difficult at times.

Mr. Siragusano, you were talking about costs between \$80 and \$90 per month per user. Are these costs with or without SRF assistance? If they are without assistance, do you know what the cost would be with the SRF assistance?

Mr. SIRAGUSANO. The SRF funds are involved in these rates. Also, an alternative plan was taken into consideration for some of these projects that we have in planning. So we're not strictly staying with gravity sewer lines. We are going to an alternative design to try to get the cost down. But even with alternatives, a lot of these projects are prohibitive. We just cannot afford them. If the interest was 2 percent, we would have problems paying back the loan.

Mr. APPLGATE. I think you make the point that perhaps a combination of grants and loans would be necessary to make projects affordable for a lot of the small communities. If Congress were to reinstate a grants program, what should be an appropriate share of the cost? And should a grants program include loans as an element?

Mr. SIRAGUSANO. I feel that a matching grants/loan combination would work well.

Mr. SPREHE. I think I would agree with that. Mr. Gilchrest was talking about a little town in his State. This was an ideal situation where innovative technology could solve that problem. A grant to design and fund part of that construction and then the SRF use to complete the construction and perhaps to help pay through investment the operating costs would be ideal for that little community. At the same time, the rest of the country would be learning how to do it differently. We don't have to keep running sewers downhill. We can pump that stuff.

Mr. APPLGATE. That makes sense.

I again may submit questions to each of you subsequent to this meeting and would appreciate you answering them.

I will yield to Mr. Inhofe.

Mr. INHOFE. Thank you, Mr. Chairman.

Mr. Sprehe, you had said that there are 4,500 firms within your association?

Mr. SPREHE. That's correct.

Mr. INHOFE. You commented on working with the private sector. Do you have any real good examples in Oklahoma where this has been successful?

Mr. SPREHE. Where consulting engineers have been employed by a small town or rural community, and frankly because there were not Federal funds involved, they were able to use innovative technology to solve the problem. That would be an example of the private sector solving the problem without being in partnership. That is what I am suggesting, that that partnership could take place.

Mr. INHOFE. I am suggesting from my own personal experience is that oftentimes you meet with resistance from governmental agencies when there are certain types of participation from the private sector that might in some way threaten the Government.

For example, when I was mayor of Tulsa we did probably more privatizing than we have ever done collectively in the rest of the history of Tulsa. They worked very, very effectively. Do you run into resistance sometimes on private participation in some of these efforts you're involved in?

Mr. SPREHE. Not from the private sector.

Mr. INHOFE. I am talking about from the Government.

Mr. SPREHE. Yes, sir. The application of standards and rules and requirements from some of the governmental agencies makes it very difficult sometimes for the private sector to provide the best service to their clients. As I said, we would strongly urge the Congress mandate some easing of those restrictions.

Mr. INHOFE. Mr. Sprehe, when a consulting engineer is involved—I know there are different where fees are paid—isn't it quite often the case that the fees are not paid until a grant is received?

Mr. SPREHE. Sometimes that is the case.

Mr. INHOFE. In the case of Mr. Hayes who was talking about the problems in some of the cities and small townships in New Orleans not having access to any of the professional advice, with 4,500 members it would seem to me that they are spread around pretty much of the Nation.

Are your firms pretty well in areas where anyone can seek that kind of advice?

Mr. SPREHE. Yes, they are. The Government had another program, the Energy Conservation Program, in which engineers were used to write up the grant applications to be sure they were accurate and well-substantiated and they were very helpful to those communities that did that. The same principle could be involved in this situation where the engineer could provide the expertise that the small town may lack in the preparation of the grant application.

Mr. INHOFE. Speaking of that particular program, that was a program where we qualified in the city of Tulsa for one of the energy conservation programs and we turned the grant back because the things they were pursuing were things that we felt we could do better without having to spend public funds on.

That is kind of unusual and I had forgotten all about that.

One thing I would like to ask you to do—and maybe you have already done it—is to come up with some figures that can be used in Congress as to the actual cost of compliance with the Davis-Bacon Act in terms of jobs and in terms of projects. In Tulsa, we had to comply with the Little Davis-Bacon Act in conjunction with the bond issue and it ended up that we could have done 18 percent more in terms of projects and would have employed that many more people also.

Do you have any comments about that? Have you conducted any such study where we could be armed with some of this information?

Mr. SPREHE. I guess ACEC has done that very study in response to a request from Congress and for our own use. I think your 18 percent number is way low. I think it is probably more like 30 percent. That is 30 percent of the money that is wasted so that more people could go to work.

Mr. INHOFE. That case was not in a labor-intensified type of public works project, so it would normally be higher than that.

But that is something that really bothers me because I know that a lot more people could be working, a lot more projects, and a lot more bang for the buck as far as the public investment is concerned. I think we rely on professionals like you to give us that information so that we can share that at appropriate times up here.

Mr. SPREHE. That is especially true in the small towns and rural communities.

Mr. INHOFE. I appreciate very much your being here today and bringing this expertise to us.

Mr. SPREHE. Thank you.

Mr. APPLEGATE. Thank you very much, Mr. Inhofe. It looks like you and I are the last of the Mohicans.

I would say to you, Mr. Sprehe and Mr. Siragusano—and Mr. Rubin is still here—how much I appreciate the expert testimony.

It has been very, very meaningful, very objective, and certainly it will play a large role in the final conclusions of this bill. I hope that we reach a final conclusion some day because we have a great deal to go through before we will be able to submit legislation to address all the problems that we have and to meet with the President to find out exactly where the Administration is going to be and what kind of support we can rely on from them with regard to support for funding.

We have a great deal of work ahead of us and you have helped to make that a little bit easier. I thank you very much for appearing before the committee.

[Subsequent to the hearing, post-hearing questions were submitted to the witnesses. The questions and responses follow:]

**National Society of  
Professional Engineers**

March 22, 1993

The Honorable Sherwood Boehlert  
Ranking Member  
Subcommittee on Water Resources and the Environment  
Committee on Public Works and Transportation  
U.S. House of Representatives  
Washington, DC 20515

Dear Representative Boehlert:

Thank you for the opportunity to provide supplementary information to my February 23, 1993, testimony on the wastewater treatment needs of small and rural communities. Specifically, I am responding to the questions submitted in your correspondence of March 2, 1993. For your convenience, I have repeated those questions and then provided NSPE's replies.

**"On page 7 of your testimony, you state that renewal of the former Construction Grants program or the establishment of a comparable program within the Corps of Engineers is unnecessary and, in fact, counterproductive. Could you elaborate? Would a small, targeted grants program for rural communities be appropriate? Also, what, if any, role would be appropriate for the Corps of Engineers?"**

Renewal of a Construction Grants program for wastewater treatment infrastructure in any federal agency is counterproductive to the efficient distribution of limited financial resources, thus delaying water quality improvements. Reinstitution of the Construction Grants program will result, again, in a missed opportunity on the part of the federal government to maximize the impact of its funding support. The primary weakness of the former Construction Grants program was that local governments were not required to repay the funds, and thus the federal government recouped none of its initial capitalization for further disbursement. This, of course, is a major strength of the State Revolving Loan Fund (SRF) program. The Construction Grants program, because it failed to recycle its funding, in effect placed a limit on the total number of communities that would have been able to receive funding in the future.

Another disadvantage with the grant program was that it tempted states and localities to postpone projects with the hope of a federal grant instead of encouraging them to finance projects through other options at their disposal, such as rate increases. The grant mechanism, then, in a sense penalized those communities that had made the tough choices

1420 KING STREET  
ALEXANDRIA, VA 22314-2794  
703 - 684 - 2800 FAX 703 - 636 - 4875

and increased rates or found other options for financing wastewater treatment projects without federal government assistance, and rewarded those communities who waited. The end result was that necessary infrastructure improvements were delayed, and thus the public and the environment were poorly served.

As I stated in my February 23, 1993, testimony, we recognize that a grant mechanism may be appropriate for addressing the environmental infrastructure needs of some economically-distressed small and rural communities who truly cannot afford a loan. However, the establishment of an additional small community infrastructure grant program within the U.S. Environmental Protection Agency (EPA) or the U.S. Army Corps of Engineers to address this need is unnecessary at this time. There are several federal and state programs already in place that meet the grant needs of small communities. Rather than establish new programs that would only duplicate existing activities, and concurrently spread limited funds too thinly across all programs, we would recommend instead that Congress provide additional funds to the federal grant programs already in operation.

Regarding the specific role, if any, that the Corps of Engineers should play, we do not believe that the Corps has a role to play in providing wastewater treatment or public water supply design and construction services to local communities. The SRF program appropriately provides for a transfer of primary responsibility back to the state and local level, while concurrently returning to those governments the flexibility to remedy the most harmful water quality problems in each of their jurisdictions. This movement toward decentralized responsibility and funding of environmental infrastructure has resulted in vast improvements over the previous Construction Grants program. To revert to a centralized management solution, such as that initially proposed for the Corps of Engineers during the 1992 Water Resources Development Act debate, would be counterproductive.

**"On page 7 of your testimony, you express support for legislative and regulatory changes that would remove obstacles to private sector participation in providing water and wastewater treatment or water supply services. Could you elaborate on some of the specific changes? Would you care to comment on current Federal regulatory efforts to encourage privatization?"**

As you are well aware, the legislative and regulatory issues that have surfaced in connection with wastewater treatment privatization are complex and we have not thoroughly studied each of the ramifications.

At this time, we would suggest at least a statutory change that could clarify the treatment of privatized wastewater treatment facilities under the Clean Water Act. Congress, through a modification to the Clean Water Act, should provide a statutory definition of a "Public purpose treatment work" (PPTW) that would place it on a par with a Publicly-owned treatment work (POTW). Privatized facilities meeting the same public purposes as POTWs should be recognized in the statute. It is only logical that Congress and EPA extend the same regulatory programs to privatized systems as currently apply to POTWs, such as

effluent limitations based on secondary treatment rather than BAT/BCT standards and exclusions from the requirements of the Resource Conservation and Recovery Act for domestic sewage. A statutory definition could clarify for EPA that such privately-owned facilities are to be treated in the same regulatory manner as POTWs, and, equally important, would send a clear signal from Congress to the public and to EPA that it considers privatization a viable option.

We compliment EPA for its diligent efforts to implement Executive Order 12803 on Infrastructure Privatization. Through public meetings, the agency has brought together representatives of states and localities, engineering service providers, environmental groups, labor organizations, investment experts, and others to discuss the breadth of issues. Unfortunately, the agency was forced to curtail its public meeting process due to budget reductions late last year. We hope that the Agency will find alternative methods for involving all affected parties as it continues to explore regulatory approaches and prepare recommendations to Congress on infrastructure privatization.

**"Would your organization support a set-aside for encouraging innovative or alternative technologies? If so, should it be modeled on earlier provisions in the Clean Water Act prior to the 1987 amendments? If not, what other mechanisms could be used to encourage innovative or alternative wastewater treatment alternatives?"**

The engineering profession has introduced numerous innovative and alternative technologies that have proven themselves and now provide cost effective and high-quality treatment of wastewater. Certainly, the engineering community will continue to recommend innovative and alternative technologies for future construction projects if lowered costs and increased environmental and public health have been demonstrated.

We recognize, however, that communities may be reluctant to accept an innovative or alternative technology because of the risks associated with an untested technology. It is not surprising that communities are hesitant to accept the financial repercussions or project delays that could result if the technology fails and rework is required.

To boost public confidence, as well as weed out ineffective technologies before they reach the marketplace, the federal government could play a supportive role through funding an innovative and alternative technologies demonstration program. If such a program were to be funded, it should be stringently managed to ensure that it did not become a vehicle for earmarking. A small-scale program that awarded funding competitively through a merit review process would provide an opportunity to test truly experimental proposals. Funding for this type of research program should be in addition to, not at the expense of, federal funding provided for the SRF program. In addition, a cost-share requirement should be placed on the recipient community if the project is proven successful.

We would favor this approach for stimulating innovative and alternative technology development, rather than a mandatory set-aside of a percentage of SRF funding. Set asides

are more appropriate for redressing "unfair" distribution of limited resources, rather than for promoting particular technology improvements. In addition, a set-aside would restrict state government flexibility to respond most effectively to their local community needs. If state and local governments can meet their Clean Water Act requirements with existing technologies, they should not be required to segregate a portion of SRF funds specifically for testing unproven innovative and alternative projects. The set aside could thus delay state and local government compliance with water quality mandates because they were effectively precluded from full access to all of their appropriated resources.

**"What, if anything, could Congress do to encourage increased water conservation and efficiency? Has your organization found such efforts to be critical in reducing POTW capital and operating costs, user rates, water use, and pollution?"**

While water conservation and efficiency initiatives do have some effect on reducing wastewater flows, such a reduction will not have a major effect in reducing the capital cost of wastewater treatment facilities because they are not only designed based on flow, but also on organic loading. Organic loadings do not decrease as a result of water saving devices, but rather increase in concentration. Likewise, the higher concentration of solids entering the sewer collection system due to lower quantities of water will probably not result in reduced sizes of gravity sewers unless slopes and sewer depths are increased, offsetting any savings. While the construction costs of wastewater treatment facilities would not be appreciably effected, there will be limited cost savings due to lower wastewater flows in the size of force mains and wastewater pumping stations, which are designed on the basis of flow quantity and the elevation to which the wastewater must be lifted, rather than on organic loading or solids concentration.

We recognize that the justification for water conservation and efficiency measures may not be primarily directed to reductions in wastewater treatment facility costs, but is more likely directed toward water quantity issues, environmental protection, energy policy, and other areas. As such, congressional actions in support of water conservation and efficiency must be based on a complete examination of the impact of such measures in all of these areas. We support water conservation practices that are based on reasonable, beneficial use rather than on simply a reduction of demand. Furthermore, the agricultural, industrial, residential, and public sectors can all institute water conservation practices, including modified land use practices, the redesign of industrial or residential equipment or appliances, and proper design of water infrastructure facilities. The private sector and federal and state government have already initiated numerous activities to encourage such changes and further incentives are welcomed.

An important mechanism for encouraging water conservation that should not be overlooked is the use of water and wastewater rates for decreasing the usage of water. For example, I am familiar with a small town in Texas that did not meter water usage. Instead, each household was charged \$3 per month for unlimited usage. After my firm recommended to this town that their rates be based on a charge per gallon rather than a flat fee, water usage

in that town was cut about 75 percent. While this is an extreme example, it nevertheless demonstrates the effectiveness that rate structures will play in water conservation. While we would not support a federal government role in establishing water or wastewater utility rates, EPA, the states, and private sector organizations, through their technical assistance and outreach activities, may be able to encourage local governments to induce water conservation through restructured rate levels.

**"Do you have any specific comments regarding a technical assistance program? Would it be appropriate to establish or provide greater assistance regarding financial management, grant/loan administration, engineer selection, and operator training?"**

Providing technical assistance to small communities in the areas of financial management, grant/loan administration, engineer selection, and operator training is essential to their ability to meet the statutory requirements of the Clean Water Act. We note that the federal government is already providing such assistance to rural communities through the "circuit rider" program sponsored by the Rural Development Administration. In addition, EPA and the states provide such services in the course of its grant/loan administration function. If Congress is to expand the technical assistance services provided directly through government agencies, we would urge you to strengthen existing capabilities and allocate additional resources rather than establish a new structure. We would also urge that you not limit your options solely to government agencies, as we do not believe technical assistance is inherently a governmental task. Higher education institutions, professional and technical associations, and the private sector already provide, or have the capability of providing, such assistance.

**"How much could be saved by eliminating the Title II grant conditions and cross cutting requirements?"**

We have not documented the cost of compliance with the Title II grant conditions and cross cutting requirements and are unaware of such estimates from other organizations; however, it is obviously a significant percentage of initial project costs. We believe that these requirements do place an administrative burden on communities of all sizes that, if eliminated, would undoubtedly reduce project costs.

**"At what point will the SRFs be adequately capitalized allowing a reduction or elimination of continued Federal funding?"**

The time period necessary for completing the task set out for the State Revolving Loan fund program is influenced by a variety of factors and thus cannot be determined definitively. Obviously, the actual level of appropriations provided by Congress through the annual federal capitalization will determine the longevity of the program. If funding is provided at less than authorized levels or on a sporadic schedule, the states receive a lesser capitalization grant and thus are able to fund fewer projects. Expanding the scope of the SRF program to include additional eligible activities and/or steadily increasing discharge

requirements without increasing appropriations will also extend the period of time for which continued federal appropriations will be required.

I also emphasize a point made in our February 23, 1993, statement that EPA's conveyance of appropriations to the states by letters of credit in lieu of the originally-contemplated cash payments restricts the ability of the states to leverage their federal capitalization grants and thus maximize the use of the federal funds. Unless the payment of federal capitalization grants are made as cash outlays on a negotiated schedule, Congress should expect a longer period of time before it can terminate its capitalization grants without harming the revolving loan funds.

In closing, I would like to take this opportunity to respond to comments you raised with state and local government witnesses at the February 24, 1993, hearing as to the availability and utility of "off the shelf" package wastewater treatment facilities as a cost saving measure for small communities and your related comment on the cost of engineering design services for such communities.

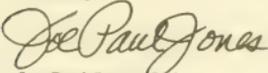

There are many manufacturers of "off the shelf" package wastewater treatment plants, and those packages do play a role in the small community. However, it has not been our experience that those package plants can operate properly unless they have been incorporated into an overall design prepared by a qualified engineer. This overall engineering design takes into account circumstances that can not be pre-determined by a package facility design, such as the specific quality, quantity, and frequency of peak flows of the local wastewater. For example, an engineer must determine whether the limiting factor of a treatment plant is in the aeration tank or in the clarifier, whether surge capacity is required, and the type of aeration equipment that will function most effectively. An engineer's services are also required to evaluate whether the effluent requires secondary or advanced treatment and whether it can be discharged directly to a stream or reused. Furthermore, there is no "off the shelf" or package collection system; sewer systems will always have to be designed based on specific site conditions. Thus, while "package" facilities do offer the engineer one element of the total wastewater treatment system design, they by no means eliminate the considerable amount of additional design work necessary for the effective operation of a treatment system.

Regarding your inquiry as to whether the cost of engineering services provided to small communities may be unnecessarily high because engineers are redesigning basic features of treatment systems that can be easily replicated through "off the shelf" technologies, we would suggest instead that the higher cost per gallon charge for small community projects compared to projects in larger communities is instead a result of the additional services that the consulting engineer provides to the small community as well as the fixed cost of the basic contract documents for projects of any size. A consulting engineer's role in the small community project goes far beyond design work to include many of the elements of what you have defined in an earlier question as "technical assistance", including financial and

regulatory management. Many larger communities have sufficient in-house capability for managing these technical and administrative functions, and as a result, the engineering firm does not provide such services. In a small community, however, where in-house capability for performing financial management and grant/loan administration is lacking, the consulting firm is expected to provide these additional services and must set its fee accordingly.

I hope that these responses provide assistance to you and other members of the Water Resources and Environment Subcommittee as you address the wastewater treatment needs of small and rural communities. Should you or other members of the Subcommittee desire further information, I would be happy to provide additional details.

Sincerely,

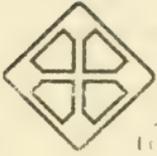

Joe Paul Jones, P.E.  
President

cc: Honorable Doug Applegate  
Chair, Water Resources and Environment Subcommittee  
Joseph A. Italiano  
Committee Editor

Mr. APPLEGATE. With that, this meeting is adjourned until 10:00 tomorrow morning.

[Whereupon, at 1:25 p.m., the subcommittee recessed, to reconvene at 10:00 a.m. Wednesday, February 24, 1993.]

National  
Association of  
Towns and Townships

PREPARED STATEMENTS SUBMITTED

BY WITNESSES

---

**TESTIMONY OF**

**TOM HARNISCH**

**LEGISLATIVE REPRESENTATIVE  
OF THE  
WISCONSIN TOWNS ASSOCIATION**

**BEFORE THE**

**WATER RESOURCES AND ENVIRONMENT SUBCOMMITTEE**

**HOUSE PUBLIC WORKS COMMITTEE**

**REGARDING**

**RURAL SEWAGE TREATMENT NEEDS**

**FEBRUARY 23, 1993**

1522 K Street, N.W., Suite 600, Washington, D.C. 20005-1202  
(202) 737-5200 FAX (202) 289-7996

Good morning. My name is Tom Harnisch. I am the Legislative Representative of the Wisconsin Towns Association, on whose behalf I am here today. I am also representing our national organization, the National Association of Towns and Townships (NATaT). The Wisconsin Towns Association represents 1257 towns and 9 villages in Wisconsin and NATaT represents over 13,000 mostly small, mostly rural communities across the United States. I appreciate the opportunity to testify before the subcommittee about rural wastewater treatment needs.

I would like to emphasize to you that our nation is one of small communities. Of the 39,527 units of general-purpose in the United States, 85% represent populations of less than 10,000. Almost half (47%) represent populations of less than 1000 persons. Most of these are the rural communities that we are talking about here today.

In Wisconsin, there are 1,266 towns, ranging from 29 people in the Town of Cedar Rapids in Rusk County to 22,000 people in the town of Caledonia in Racine County. Over 800 towns in Wisconsin have fewer than 1,000 people. Thirty-one percent of the state's population reside in towns, which serve the unincorporated areas of the state. We are what in some states are called townships. Villages and cities serve the incorporated areas of the state. Town governments in Wisconsin have the authority to create sewer and water districts as part of their town government function, or often these towns may create a new special purpose district for sewer and water called a town sanitary district.

#### **The needs of small communities**

Since the end of General Revenue Sharing, small local governments typically do not receive funds from the federal government. General Revenue Sharing was the last broad federal investment program in rural America. Municipalities with populations of 50,000 and greater generally receive federal funds from one or more entitlement programs such as the Community Development Block Grant program. Very small communities are left to scramble for funds from the Farmers Home Administration, the Economic Development Administration,

and small cities CDBG funds. NATaT has estimated that 80 percent of local governments receive no money from the federal government; it is safe to assume that the 80 percent was predominantly small governments.

These limited sources of federal funds are the only federal contribution small communities receive, if they receive any funds at all, to pay for not only Clean Water Act mandates, but also Safe Drinking Water Act mandates, landfill design mandates, ADA mandates, and the many other unfunded mandates passed on to local governments over the past two decades.

I would like to briefly touch on a couple of points about wastewater treatment in small communities. This subcommittee has, no doubt, heard many statistics about the needs of wastewater treatment in small communities. The U.S. EPA's *1990 Needs Survey Report To Congress* stated that as much as \$110.6 billion is needed in capital investments over the next 20 years for wastewater treatment facilities. The Association of State and Interstate Water Pollution Control Administrators has estimated that capital investment for wastewater treatment in small communities with populations of 5000 or less will exceed \$10 billion in the next ten years.

Rural wastewater treatment needs have been largely unmet because they have been subordinated to the needs of large metropolitan areas. Under the Construction Grant program created by Title II of the Federal Water Pollution Control Act (the Clean Water Act), \$55 billion in funding was available from 1972 to 1990 for new construction or upgrading of publicly-owned treatment works (POTWs). Grants covered from 55 percent to 75 percent of construction costs. Systems serving 500,000 or more customers received 25 percent of all Construction Grant funds, but represented only two-tenths of one percent (0.2) of all POTWs.

Under the CWA amendments of 1987, the Construction Grants program was phased out and replaced by a federally capitalized revolving

loan program administered by the states (known as the SRF). This program has been criticized because often the money in the SRFs does not make it way down to smaller communities in the states. The timing could not have been worse, for while EPA funding has moved from grant funding to loans (to the disadvantage of smaller communities that fundamentally need some grant assistance), the federal and state government have also focused far more enforcement activities on small POTW compliance.

The *1988 EPA Needs Assessment* revealed that three-fourths of all documented facility needs were in rural communities with fewer than 10,000 residents. The cost of addressing those needs was estimated at that time to be \$13 billion, or roughly a quarter of the total national needs identified by EPA. Unfortunately, the *1990 Needs Assessment* does not allow a similar breakdown.

It is safe to say that the *1988 Needs Assessment* underestimated future costs, as does the *1990 Needs Assessment*. Some of the critiques of the *1988 Needs Assessment* are contained in the 1992 General Accounting Office report *State Revolving Funds Insufficient to Meet Wastewater Treatment Needs*, which was requested by the former chairman of the full committee. That report noted that the actual investment required was much higher than the \$83.5 billion cited by EPA. Costs associated with replacing wastewater treatment facilities were not included because replacement costs were not eligible in the past, as well as the costs of nonpoint source pollution and estuary protection.

While some of those costs are captured in the *1990 Needs Assessment*, those estimates are still low. Only "documented" needs which meet specified criteria established by EPA are captured. Many unsewered communities have not met strict needs assessment criteria and are not included. People in these areas, which are most likely unincorporated, probably are well aware that their septic systems are failing and the 17 acceptable criteria for documenting needs are unknown and irrelevant to them. Small local governments, already

strapped for cash, are not going to incur the expense necessary to document their needs without some expectation of being funded.

EPA's *1990 Needs Assessment* openly admits that certain cost estimates were not included because of the difficulty of determining those costs, the most notable example being for combined sewage overflows. The costs of complying with Phase I and II of the industrial stormwater discharge permitting program are also very uncertain.

#### **Sewage treatment needs in rural Wisconsin**

The needs of rural areas in Wisconsin vary from the need for a complete sewer system (collection systems and treatment plants) to collection systems to be linked to existing treatment plants to the need to upgrade current systems to meet state compliance requirements for maintenance of existing treatment facilities. It is estimated that, of the entire State of Wisconsin, approximately 75 percent of the population is currently receiving sewer service from public systems. However, the majority of rural areas still remain unsewered. Certainly, not every farm home in Wisconsin will or should be in the near future connected to a public sewer, but as the population spreads across the state, rural needs for sewer systems will grow.

In Wisconsin, the issues related to rural wastewater treatment can be categorized into three distinct types of physical settings. First, many rural unincorporated communities, better called "crossroad communities," sit at the intersection of two highways or local roads, have 50 to 100 homes or less, a tavern, feed mill and a grocery store (now often closed). They have no sewer systems or have treatment plants that need major upgrading to meet the ever changing limits and requirements for wastewater treatment. The homes have private septic systems, often failing, where the septic systems may be 30 to 40 years old. If the community has a treatment system, it too is frequently outdated and does not meet today's treatment standards. Since these communities are often unincorporated, they are the responsibility of the town.

The second physical setting of needs in Wisconsin for rural wastewater treatment is existing developments of cottage and recreational homes along or near lakes and river fronts. With Wisconsin's extensive water frontage and recreational developments (over 15,000 lakes), many of these residences, although seasonal when constructed, have been converted to year round residences. Yet many of these properties also have private septic systems constructed many years that do not meet today's minimum standards. These systems are often failing or non-functioning. The failure of these systems then results in discharges into the very clean waters sought for recreational enjoyment.

The third setting of rural wastewater needs is for existing residential developments near or adjacent to incorporated cities and villages which have treatment plants. The current state of law, following the U.S. Supreme Court decision originating from Wisconsin, Town of Hallie v. City of Eau Claire, holds that cities and villages may refuse sewer and/or water extensions into towns unless the property owners agree to be annexed to the city or village. Often due to higher tax rates in cities and villages and often due to the fact that not all individual septic systems may be failing, the town residents do not want to sign annexation petitions in support of annexation. With the reluctance to be annexed, the result is that no sewer or water extensions are offered from the city or village, even though some town residents may have major contamination and environmental degradation on their property from these failing sewage systems. These systems can and do cause major public health concerns within these towns.

This problem is complicated because of the existence of local political turn battles between city or village officials and the local town. The Supreme Court, in the Town of Hallie decision cited earlier, held that cities and villages do not violate federal antitrust law by refusing to extend sewer or water lines into the adjoining town without annexation. However, it must be pointed out to this Subcommittee that under federal law, the city or village treatment plant often received federal and state funding based on a required "local service area" which included the adjoining town property area.

We believe that if federal or state funds are used to construct and create sewage treatment capacity based on a service area outside the city or village, then the funds received from the federal and state government, which are overwhelmingly tax dollars paid by all citizens, should be used to service the total described area without the condition of annexation to the village or city. This refusal to extend such lines without annexation results in the failure to meet the environmental and public health needs of the service area. In fact, in the mid-1970s we had a town (Town of Beloit) which, because of the City of Beloit's refusal to extend sewer lines without annexation (the property owners refused to agree to annexation) resulted in a child incurring a severe illness from "ponding septage" from a individual failing septic system in the town. The refusal of sewer extensions should not be used as a tool to force annexation when environmental degradation then threatens and endangers the public health.

This Subcommittee should affirm the right of an area to receive sewer lines without the requirement of having to be annexed if the area was in a proposed service area for a federally funded water treatment receiving funds under the Federal Water Pollution Control Act. We acknowledge that any sewer extensions to these service areas should be provided only where there is existing residential development, where the systems now have been failing and where environmental degradation is occurring. To force extensions for new or future development would be to promote rural or urban sprawl.

Another policy in Wisconsin which is contrary to the concept of putting environmental needs first in the State is the Department of Natural Resources' (DNR) policy of "nonproliferation." This policy means that the State refuses to allow towns to develop their own individual treatment plant alternative. While regional concepts are often most cost effective, rather than a number of small plants, if the city or village refuses to extend sewers without annexation or refuses to allow the town, through its own town sanitary district, to purchase sewage treatment services, the result is the failure to properly treat sewage.

Frankly, the nonproliferation policy of the DNR has become, in fact, the State's major development and planning "policy." However, we believe that public health protection and environmental protections should come before the State's attempt to control growth by its sewer policy. We believe that these types of political governance issues should be put aside and the needs of public health and protecting the environment should come first.

#### **SRFs and small communities**

I asserted earlier that the state SRFs do not do a good job of getting money to smallest and neediest communities. Federal SRF standards do not require states to establish either small community set-asides or to fund innovative and alternative wastewater systems. Set-asides allow small communities to compete amongst themselves for project funding, rather than compete for funding with larger communities that are more adept at grantsmanship, have their own engineering staff, and that can generate facilities which have larger economies of scale, offering services at a lower unit cost. Costs per household can be significantly higher in a water system with 500 hook-ups versus a city of 50,000.

SRF loans are not affordable to many of the smallest communities, which cannot afford to repay loans at even the lowest rates. In the past, construction projects in small communities blended Farmers Home Administration money with Small Cities Community Development Block Grant funds or Construction Grant assistance from EPA. Many communities that would have previously relied on EPA Construction Grant money are now left with only FmHA funds, which will be severely stretched to replace construction grants money.

The Environmental Financial Advisory Board, an independent committee charged with advising EPA on financial issues and suggesting innovative funding methods, noted the special problems faced by small and economically disadvantaged communities from SRFs. The Advisory Board recommended creation of a set-aside within the SRF for small communities or a new revolving fund devoted to small

communities, and to extend SRF loan terms beyond 20 years for small communities.

Rather than run through the litany of problems facing small communities in accessing the SRF program, I would refer members of the subcommittee to the GAO's 1992 study referenced above for a more in-depth discussion of how SRFs can be made responsive to their needs. I would only note one of their principal findings: Almost three-fourths of the state SRF officials responding to GAO's survey on the performance of SRFs maintained that SRFs will not meet wastewater treatment needs in small communities.

In Wisconsin, our State Legislature has created a "financial hardship" program which has been of particular benefit to high cost rural projects. Eligibility for the hardship program is not limited to rural projects, but because eligibility for the hardship program is based on higher user charges relative to income levels and to percentage of property values, many rural projects qualify for this program. The problem in Wisconsin is that only 12 percent of the total RLF is available for hardship projects. In FY 1993, only two of the 24 projects on the "hardship" priority list could be funded by the hardship program. Twenty-two other projects, which were almost all rural, went unfunded. Actual needs identified for those remaining 22 projects exceeded \$11 million.

We would support congressional initiatives to set-aside funds for rural projects or hardship projects based on both priority needs and ability to pay. I have attached both a summary of the Wisconsin Financial Hardship Assistance program and a Priority List of Hardship Needs projects. Clearly, such a set aside will help meet rural clean water needs. Currently, rural projects must compete for dollars in the SRF with urban wastewater needs. Of the executed loan commitments for 1989-1991 under Wisconsin's Clean Water Fund, the Milwaukee Metropolitan Sewage District received \$204 million of the \$421 million available under the entire Clean Water Fund. This drain of dollars for the most urban needs puts rural areas at an extreme disadvantage.

**Innovative and alternative approaches need to be encouraged**

Innovative and alternative systems, such as the use of constructed wetlands or lagoon systems, can help small communities, individual households or rural subdivisions afford wastewater treatment. Rural areas are ideal for such innovative systems, having the land area available and a lower population density. These systems have the further benefit of requiring lower operations and maintenance costs than traditional mechanical systems, thus lowering total project costs, and eliminate much of the need for collector systems, which can add up to 80 percent of a rural wastewater system in sparsely populated areas.

For further information on alternative systems, I would refer the subcommittee to the testimony of Bill Buckrop, who testified on behalf of NATaT before the Investigations and Oversight Subcommittee last year during their hearings on constructed wetlands.

In his township, secondarily treated effluent from 10,000 persons in three townships is pumped via pipeline to the edge of a wetland. The pipe surfaces and continues across the wetland for 1/2 mile on a wooden dock. It then splits into a "T" and continues for 1/4 mile in each direction. Effluent escapes through slots every 10 feet along the outside of the 12-inch pipe. The effluent, which has already been treated to State and Federal secondary treatment standards, flows slowly overland towards the Muskegon River. The wetland, through soil absorption, plant uptake, and microbiological mechanisms, further treats the effluent to very high levels by the time it reaches the wetland outlet.

The wetlands option was completed for \$600,000, compared to a \$1.6 million conventional system that was under consideration, largely because of savings in construction cost. Since 1978, more than 1 billion gallons of water have been treated in the wetland, federal standards have been met and the treatment facility and the wetland process have received many awards.

**Technical assistance to small communities**

One of the biggest needs for small communities in planning and financing wastewater projects is technical assistance programs. Small communities with part-time or no professional staff often lack the expertise to address the many aspects of wastewater improvement planning. Through technical assistance from federal and state agencies and private organizations, local governments can decide what options are most appropriate for their community.

NATaT has a grant from the U.S. EPA's office of Research and Development to operate a Technology Transfer Center that provides materials to help small communities solve environmental problems, including wastewater needs. The responses generated by the Center are issue-specific, state-specific and agency-specific. NATaT staff has reviewed available resources and selected those that provide a balanced view of the problems and solutions, are written in understandable language, and are affordable to towns with limited finances. Technical assistance agencies and organizations are listed for the state or region from which the request is received (e.g. state Rural Water Association, regional Rural Community Assistance Programs). Regulatory and financing agencies are also listed by state with a brief explanation of the roles played by each for local officials just learning the issue and where the various actors fit in.

NATaT regularly interacts and exchanges information with the Rural Community Assistance Programs, Rural Water Associations, and the Small Flows Clearinghouse, two other organizations that provide valuable technical assistance to small communities. A member of NATaT's staff, Hamilton Brown, serves on the National Environmental Training Center for Small Communities, which is funded by the EPA to offer training and materials for small town water, wastewater and solid waste services. The Center is focusing on the need to integrate the efforts and strategies of the regulatory, funding, monitoring and technical assistance agencies with what is affordable and effective at the local government level. The federal government can provide valuable

leadership to small communities through such efforts as the National Environmental Training Center for Small Communities.

NATaT has written a guidebook for small communities entitled *Treat It Right: a local official's guide to small town wastewater treatment*. The purpose of the book is to guide small town leaders through the overall wastewater treatment process and to help them arrive at an affordable solution. When federal grants were more widely available, many communities relied on outside funding to cut their share of construction costs. Now community leaders find it necessary to save money by selecting low cost, low maintenance systems. Guides such as this one that explain requirements in simple language are very useful in small communities.

### **Conclusion**

We encourage the federal government to fully fund the SRF program, which has been funded at less than authorized levels since its creation. We also would like to see some attempt on the federal government to encourage states to use their SRF monies to address rural wastewater needs, including set-asides for hardship cases and allowing low-cost alternative means of wastewater treatment for small communities.

Small communities understand that in this time of federal fiscal constraint, money is not always available to help them with many of their infrastructure needs. If that is the case, the federal government owes it to small communities to make alternative, flexible approaches available so that we can comply with federal mandates, or at least eliminate that bias against them. Small communities cannot be expected to spend vast amounts of money on expensive technologies that are not appropriate for their size.

Federal and state requirements should be reviewed to ensure that there is flexibility given to local governments to implement systems that are best suited to their individual needs. There is more noncompliance in small systems with complicated mechanical processes, where there is operator error, than in small simple systems.

The federal government also needs to provide more technical assistance to small communities to comply with federal mandates.

Through assistance with facility planning, financial management, grant/loan administration, engineer selection and operator training, small communities can make projects more affordable.

CLEAN WATER FUND FINANCIAL HARDSHIP ASSISTANCE PROGRAM UPDATE

Chapter NR 163, Wis. Adm. Code, administrative rules for the financial hardship program was finalized in November 1991. The rules were prepared by DNR staff with the assistance of the Clean Water Fund Ability to Pay Advisory Committee. This committee was composed of Department of Natural Resources, Department of Administration, Department of Development, U.S. Farmer's Home Administration staff, a consulting engineer, a municipal finance manager, two legislators and a town sanitary district official.

It is required that a municipality seeking financial hardship meet two criteria. These criteria are established in State Statute under s. 144.241(13), Stats., and are as follows:

- a. total charges imposed on residential users in the municipality that relate to wastewater treatment as a percentage of the total adjusted gross income (income factor) must exceed 1.5% and
- b. total charges imposed by the municipality that relate to wastewater treatment as a percentage of the total equalized value of property in the municipality must place the municipality in the 25% of municipalities with the highest percentage

The total dollars available from the Clean Water Fund for the purpose of assisting financial hardship communities is also established in statute and is set at 12% of the total subsidy given in any year.

SUMMARY OF THE HARDSHIP PROGRAM:

1. Each year, a funding list of municipalities determined to meet the criteria established in the statute will be prepared. Municipalities qualifying as hardship will be ranked on the list and funded based upon the environmental priority of their projects using criteria in ch. NR 161, Wis. Adm. Code. DNR will provide hardship funding to the extent that subsidy is available under the program.
2. Financial Hardship assistance will be available to a Step 3 project that has met the statutory criteria and has submitted an Intent to Apply form, including hardship information, by December 31. In addition, plans and specifications, and a Step 3 application needs to be submitted by the following June 30. For step 1 and step 2 applicants, an intent to apply form, including hardship information is due December 31 and a Step 1/2 application by the following June 30. Projects that do not meet the June 30 requirements may be eligible for hardship funding if they are placed on the supplemental list.
3. The municipality or municipalities proposed to be served by the construction project will be the entity or entities that will be evaluated for hardship. If the service area is a portion of a municipality, the evaluation would not be limited to only the service area of the project but would include the entire municipality. If the construction project has a service area including two or more municipalities, i.e., a regional project, the combined data for all the municipalities will be evaluated.
4. Applicants qualifying for Step 1 and step 2 financial hardship assistance will be given the assistance prior to construction, as costs are incurred. (See #6 below). The final determination of hardship assistance will be made at the time the Step 3 financial hardship assistance agreement is awarded. The determination at Step 3 will be a one-time decision. Applicants that do not qualify for financial hardship assistance at Step 3 and receive regular clean water fund loans, will not be eligible to refinance these loans with financial hardship assistance if the municipality achieves the criteria (a and b on page 1) in future years.

5. The final hardship calculation at the step 3 phase will be used to determine the amount and type of financial hardship assistance to be applied to step 1, step 2 and step 3 phases. Interest rates will be reduced below the tier 1, tier 2, or transition (2.5%) levels. Grants will be awarded if reducing interest rates to 0% is not sufficient to decrease user costs so that total charges imposed on residential users in the municipality as a percentage of total adjusted gross income is not greater than 1.5%, up to a 90% grant.
6. Criteria from the statute will be used to determine if a community qualifies for Step 1 and Step 2 financial hardship assistance. Estimated construction and operation and maintenance costs for the current project will be used in calculating the first criterion. Financial hardship will be provided to a community for Step 1 and Step 2 work based on the eligible incurred costs identified in the Architectural/Engineering (A/E) subagreement. Projects will be ranked according to their priority values. There will be one funding list based on priority values for all step 1, step 2 and step 3 hardship projects.
7. If a community no longer meets the financial hardship criteria at the Step 3 phase the community will need to repay the step 1 and step 2 costs at the non-hardship interest rate (tier 1, 2 or 3). Repayment of Step 1 and Step 2 hardship assistance will be required if a community does not proceed to the construction phase. If the cost-effective solution is a "no-action" alternative for facilities planning approved by DNR's Bureau of Wastewater Management, the municipality will be required to repay 25% of Step 1 costs at the interest rate the project would have received as a regular Clean Water Fund applicant.
8. Loans from other sources such as commercial institutions or Farmers Home Administration can be subsidized with financial hardship assistance.
9. Re-evaluation of hardship determinations will be based on more current or concise data for user charge revenues, adjusted gross income, property valuation and project costs. This procedure includes getting more concise income data for sanitary districts by collecting social security numbers.
10. Indian Tribes may participate in the Hardship program. Indian tribes must meet the first criterion, (residential user charges as a percentage of adjusted gross income is greater than 1.5%), to qualify for hardship, but by statute are not required to meet the second criterion which addresses total user charges as a percentage of property value. Because adjusted gross income (AGI) for Indian tribes is not collected by the Department of Revenue, AGI will be determined by using the most recent census income data, adjusted by a cost of living factor.

FY 1993 CLEAN WATER FUND HARDSHIP ASSISTANCE FUNDING LIST

SEQ NO.	PRIORITY SCORE	MUNICIPALITY	PROJECT#	PROJ TYPE	PROJECT DESCRIPTION	DNR DISTRICT	TOTAL AMOUNT REQUESTED	HARDSHIP PRESENT VALUE SUBSIDY	CUMULATIVE PRESENT VALUE SUBSIDY
1	86.310	Mercer SD #1	4302-01	COMP*	STPH & Sewer Extension--Steps 1 and 2	HAD	\$163,073	\$113,825	\$113,825

Professional Engineers**

TESTIMONY  
OF THE  
NATIONAL SOCIETY OF PROFESSIONAL ENGINEERS  
ON  
SMALL COMMUNITY WASTEWATER TREATMENT NEEDS  
HEARINGS ON REAUTHORIZATION OF THE CLEAN WATER ACT

PRESENTED BY

JOE PAUL JONES, P.E.  
PRESIDENT

BEFORE THE

SUBCOMMITTEE ON WATER RESOURCES AND THE ENVIRONMENT  
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
U.S HOUSE OF REPRESENTATIVES

FEBRUARY 23, 1993

1420 KING STREET  
ALEXANDRIA, VA 22314-2794  
703 • 684 • 2800 FAX 703 • 636 • 4875

SUMMARY OF RECOMMENDATIONS  
TESTIMONY ON SMALL COMMUNITY WASTEWATER TREATMENT NEEDS  
HEARINGS ON REAUTHORIZATION OF THE CLEAN WATER ACT

- Authorize and appropriate funds to the State Revolving Loan Fund (SRF) at a minimum of \$2 billion a year to meet traditional eligibilities. The SRF provides funding more efficiently, more expeditiously, and at less expense to the Treasury than does a Construction Grants program. The SRF does already and will continue to meet many small community funding needs. New expectations placed on the states and localities in the 1987 CWA amendments and possible new mandates under consideration will require additional authorization and appropriations.
- Consider extending the loan amortization period for economically distressed communities from the current 20 years to up to 30 years.
- Disburse SRF funds to economically distressed communities in the form of zero interest loans and combine SRF loans with grant subsidies from other programs for additional relief.
- Oppose deferment of loan repayments until after three years of project completion (current repayment obligation is one year).
- Eliminate applicability of burdensome Title II requirements and federal cross-cutting authorities to SRF financed projects.
- Eliminate restrictions on the use of SRF funds to pay for the costs of land, easements, and rights of way associated with wastewater treatment facility construction.
- Direct the EPA and the Department of Treasury to disburse capitalization grants to the states as cash outlays on a negotiated schedule, rather than letters of credit.
- Recommend that establishment of any set-aside within the SRF accounts for rural community assistance be voluntary rather than mandatory.
- Enhance funding of existing federal programs that provide grant assistance to small and economically-distressed communities, such as that operated by the Rural Development Administration.
- Oppose reauthorization of the EPA Construction Grants Program.
- Support legislative and regulatory changes that remove obstacles to private-public partnerships.
- Support establishment of separate revolving loan funds for potable water supply systems and solid waste disposal facilities.

Mr. Chairman and Members of the Committee:

Thank you for the opportunity to testify today before the Subcommittee on Water Resources and the Environment on the wastewater treatment needs facing our nation's small communities. I am Joe Paul Jones, P.E., and I am a Principal and Vice President of Freese & Nichols, Inc., a consulting engineering firm based in Forth Worth, Texas. I am a licensed professional engineer in Texas and the President of the National Society of Professional Engineers, on whose behalf I testify today.

The National Society of Professional Engineers (NSPE) was founded in 1934 and represents 75,000 engineers and engineering students in the United States and abroad in 535 local chapters and 54 state and territorial societies. NSPE is a broad-based interdisciplinary society representing all technical disciplines and all areas of engineering practice, including government, industry, education, private practice, and construction. NSPE's goals include serving the public, advocating the application of engineering knowledge and skills in the public interest, and influencing technical public policy. With these goals in mind, NSPE participates in the policy development process on issues affecting the public health and the environment, including the Clean Water Act.

Freese and Nichols, Inc., has provided a vast array of professional engineering services, including wastewater treatment design and technical services, to communities in Texas for nearly 100 years. Among the projects I have managed during my over 35 years employment with Freese and Nichols, Inc., have been wastewater treatment facilities ranging from standardized "package" facilities in small towns to a \$100 million facility for the Trinity River Authority between Forth Worth and Dallas. I speak primarily from the perspective of having had considerable hands-on involvement in managing these types of projects. In the late 1970s, I represented NSPE on a joint committee with the American Consulting Engineers Council and the American Society of Civil Engineers, working with the U.S. Environmental Protection Agency (EPA) to resolve numerous consulting engineering contract matters associated with the Agency's Construction Grants program. Through this cooperative effort, we were able to assist the Agency in developing high standards for evaluating the engineering design work performed under that program.

The role that the consulting engineer plays in wastewater treatment projects goes far beyond the design and development of plans and specifications for the facility. In many circumstances, it is also necessary to assist the client in managing the regulatory and financing issues associated with the project. This is particularly true for small and rural communities where in-house staff for handling such tasks is unavailable. In these instances, the professional engineer is responsible for obtaining permits from the relevant government agencies, developing the project's budgets, managing its expenses, and, most relevant to my remarks today, locating funding assistance. An equally important role is played by professional engineers in all levels of government who oversee the permitting process and ensure compliance with environmental and public health statutes. Because of these multiple roles in the wastewater treatment construction process, professional engineers have a perspective on the whole gamut of technical,

regulatory, and financial issues confronting small communities as they try to comply with public health and water quality needs and expectations.

So often the needs of our nation's rural communities are overshadowed by the pressing needs of the metropolitan areas in discussions of environmental infrastructure and water quality. Clearly, the funding challenges that rural communities face require particular examination. We commend this subcommittee for launching its review of the Clean Water Act with this series of hearings on such an important topic. I can assure you that the engineering profession is also prepared to assist our nation's small communities in meeting their wastewater treatment needs.

I will attempt to focus my remarks today on environmental infrastructure financing issues as they pertain to small communities. However, it is impossible to examine solutions to their problems without also discussing the overall challenges facing wastewater treatment funding. NSPE has had a long-standing interest in ensuring that the wastewater treatment funding programs are designed and operated efficiently and that they distribute the burden appropriately among the public and the various levels of government. My remarks today focus both on the improvements to existing wastewater treatment funding programs that are necessary to make them more suited to the particular needs of small communities, as well as on proposals for new alternative funding programs targeted to rural communities.

The U.S. has come a long way in restoring the nation's waters since the Clean Water Act was first passed in 1972. A great deal of this progress can be credited to the increase in the construction of municipal wastewater treatment facilities spurred by funding from the Act's infrastructure financing program. Under the Clean Water Act, the federal government has already appropriated \$60.4 billion to assist in wastewater facility construction. However, much work remains. The EPA estimated in its 1990 Needs Survey that 20-year design needs for wastewater construction would be approximately \$80.4 billion just to satisfy needs for the traditional eligibilities defined by the 1972 Act. EPA estimated that figure to rise to \$111.5 billion if new requirements amended into the Act in 1987 were factored in. While the needs estimates for small communities are less current, they are also staggering. EPA's 1988 Needs Survey identified the unmet needs of small communities alone to be at \$12 billion over a 20-year period, out of a total estimated need at that time of \$83.5 billion. Continued federal, state, and local government financial assistance is required if the nation's small communities are to meet these remaining construction needs.

#### **State Revolving Loan Fund Program**

We are a strong advocate for the State Revolving Loan Fund (SRF) program, viewing it as the best approach yet found for providing federal and state financial assistance to all local governments, including rural towns, as they seek to meet the water quality needs of their citizens. The SRF program appropriately provides for a transfer of primary responsibility for funding wastewater treatment back to the state and local level, while concurrently returning to those governments the flexibility to remedy the most harmful water quality problems in each of their jurisdictions. Through the SRF program, wastewater treatment services are being provided

more efficiently, more expeditiously, and at less expense to the federal treasury than was possible through the Construction Grants program.

We are pleased that the engineering community was one of the first to recognize the merits of a revolving loan assistance program for funding wastewater treatment construction. In 1983 and 1985 NSPE recommended to various congressional committees, including this subcommittee, that the federal Construction Grants program (Title II) of the Act be discontinued and replaced with a revolving loan assistance program. Congress reacted favorably to this proposal, and many of our suggestions were later incorporated into the Title VI program created in 1987. We are proud that NSPE was instrumental in providing much of the economic modeling and research which formed the basis of the SRF program.

While some have criticized the SRF program for failing to address the needs of small communities, the data we have reviewed indicate that this criticism is not entirely accurate. For example, in testimony before the Public Works and Transportation Subcommittee on Investigations and Oversight last year, EPA stated that small communities have received 33 percent of the funding appropriated under the SRF program. EPA also noted that these small communities had received only 24 percent of the federal funds under the construction grants program. Thus it is difficult to make a case that small communities have been disadvantaged by the switch from grants to loans. In fact, EPA pointed out that "when compared to the amount of flow at these facilities (less than 10 percent) and the population served (about 9 percent), the funding history suggests that small communities have received a relatively substantial portion of funding". It should also be noted that the percentage of SRF funds going to small communities should increase as many of the earlier projects that benefitted larger municipalities reach completion.

While the SRF program is fundamentally sound, we do, however, acknowledge that the program's current structure and operation does not give the states sufficient flexibility to meet the needs of every community. In particular, small communities with populations of less than 3,500 appear to be under-served by the SRF program. In some cases, this is a result of a legitimate inability of that small town to repay even the principal subsidy, much less the accrued interest. In those circumstances, grant mechanisms, possibly in conjunction with SRF funding, may be more appropriate. I will address that issue in more detail later. But, in many cases, rural community usage of the program is prohibitive because of burdensome statutory and regulatory requirements that hamstring the flexibility of the administering agencies to accommodate small community needs. The following statutory changes should be made to Title VI of the Clean Water Act so that the SRF program can better take into account the financial circumstances of small communities.

- Congress should consider extending the loan amortization periods for economically-distressed communities from the current 20 years to up to 30 years. We do not believe that extension of the amortization period should apply to all SRF loan recipients, but rather only to those meeting a carefully crafted definition of "economically distressed." The needy rural communities that are the focus of this hearing today would undoubtedly

fall into such a category. An extension of the amortization would assist local governments in maintaining user charges at more affordable levels.

- States should be allowed to disburse funds to economically-distressed communities in the form of zero interest loans to ease the burden of repayment. The states should also continue to work with existing federal and state grant-making authorities to couple a grant subsidy with an SRF loan as an additional relief for small communities.

However, we do not support suggestions to change the statute to permit economically-distressed communities to defer loan repayments until after three years following project completion rather than the current one year requirement. Deferring the commencement of repayment will only postpone the need for the community to charge adequate rates. The longer the rate increase is postponed, the more difficult it will be politically for public officials to link the rate increase to the infrastructure improvement. Postponement could lead to more defaults in later repaying loans rather than relieving the financial burden as intended.

Several other corrections are necessary to make to Title VI that, while applying to all loan recipients, would clearly have a positive impact on rural communities, as well. These include:

- eliminating the requirements of Section 602(b)(6) of the Clean Water Act, which subjects facilities receiving SRF-financed loans to the same requirements that are placed on Construction Grant recipients. While the Title II requirements may have been appropriate for the Construction Grants program, they are unduly burdensome and duplicative of state-managed efforts under the SRF program. For similar reasons, revisions to the Act should eliminate the applicability of the burdensome federal cross-cutting authorities that apply to the program. The states, having been given the primary responsibility for implementing the SRF program, should also be afforded the maximum flexibility to operate the programs as they best determine as long as they meet the goals of the Clean Water Act. The Title II and federal cross-cutting requirements hinder accessibility to the SRF program and discourage the use of SRF-financed loans. Small communities are particularly discouraged by these many administrative requirements, and as a result, forego applying for a state revolving loan;
- eliminating restrictions on the use of SRF funds to pay for the costs of land, easements, and rights of way associated with wastewater treatment facility construction. This is particularly important for rural communities, which are often required to make what to them are major land purchases to install collector/interceptor sewage systems.

No discussion of the limitations on financing of small community projects under the SRF program would be complete without a thorough discussion of the future authorization and appropriation levels for the program overall. If the SRF program is underfunded, the rural communities that could be seeking SRF loan funds will clearly suffer, and may be the first to be denied funding. If the Congress and the Administration hope to provide greater federal financial assistance to environmental infrastructure in rural communities, the overall funding

needs of the SRF will have to be met.

As you are well aware, legislative authority for the SRF program expires in FY 1994. As I have mentioned earlier, however, fulfilling the construction needs of both large and small communities to come into compliance with the requirements of the Clean Water Act is far from complete. In part, this can be attributed to previous appropriations levels for the Construction Grants and SRF programs that failed to keep pace with the full \$18 billion that was authorized for the program. Because the programs were not funded according to the schedule set out by Congress, there remains a backlog of ready-to-go projects. In addition, projects that would have been completed had there been full appropriations early on are still in the construction phase, thus tying up funds that have been loaned to those projects from recirculation.

In addition, EPA conveys the appropriations to the states by letters of credit in lieu of the originally-contemplated cash payments, which unfortunately restricts the ability of the states to leverage their federal capitalization grants. When the statute was passed by Congress, we felt, and still feel, that it would allow EPA to disburse funds to the states on a fixed payment program in advance of the state's payments to grantees, that is, on a fixed payment program. These federal payments, along with the repayment of loans made from the state SRF loan funds, could then be pledged for debt service for state-issued bonds, thereby "leveraging" the effects of the federal contributions. The dollars to be generated from this leveraging was an essential element for generating the total funding necessary to meet the goals of the original program. But the federal capitalization funds that have been appropriated have not been provided to the states in advance of their commitment of the funds. As a result, the federal government has missed the opportunity to multiply the effect of its initial investment. If the federal government had distributed the capitalization grant in a form which would have permitted its leveraging, the states could have generated greater levels of capital much sooner with their revolving funds and accelerated the construction of these much-needed pollution abatement facilities. Correspondingly, small communities and other eligible loan recipients have had to postpone wastewater treatment improvements because of a lack of available capital. We urge the Subcommittee to use the opportunity before you in Clean Water Act reauthorization to direct EPA and the Department of the Treasury to implement the original intent of the law -- the payment of federal capitalization grants as cash outlays on a negotiated schedule.

Furthermore, impairments to water quality for which solutions were not originally contemplated in the 1972 Act, but have now become national priorities (including risks associated with combined sewer overflows and stormwater runoff) have escalated the costs for wastewater treatment construction far beyond what was originally envisioned. Thus, even higher appropriations levels are necessary in the immediate future.

Because the revolving loan fund program is the primary vehicle for providing federal funding assistance for municipal wastewater infrastructure construction, it is imperative that Congress reauthorize the program and provide full appropriations. A minimum of \$2 billion annually should be authorized and appropriated in order to meet the original eligibilities of the Act. The new expectations placed on the states and localities in the 1987 amendments and possible new

mandates under consideration will require the Congress to increase authorizations and appropriations.

We stress that full federal capitalization of a properly implemented SRF program represents a commitment to jobs creation and long-term economic development in rural areas and cities that is well worth the investment. It is also a commitment to long-term deficit reduction for, if adequately capitalized, the state's revolving funds will eventually be able to function independent of federal capitalizations. But without full federal appropriations early on, the SRF program will not accomplish nearly as much as was originally envisioned. We strongly urge the Subcommittee to continue to influence the Appropriations Committee to fully appropriate the current and future authorization levels that you will set for this crucial program.

I also want to address one additional SRF financing issue particular to rural communities that the Subcommittee may want to consider during this reauthorization process. Legislation was introduced last year that would have mandated that a percentage of each state's federal capitalization grant be set aside exclusively for rural community environmental assistance projects. While we recognize that the intention of such a provision is to ensure that the benefits of the SRF capitalization are equitably distributed among rural and urban communities, we are concerned that such a requirement could restrict the ability of the states to address the most pressing water quality problems of their particular state. Certainly, those in New Jersey are different from those in West Virginia, for example. Because the infrastructure needs of small communities vary among the states, a mandatory set-aside may be overly restrictive. If such a set-aside is to be made mandatory in all states, then supplemental federal funding should be appropriated specifically to fund that set-aside above the state's regular SRF capitalization grant. Also, if such a set-aside was mandatory, the state matching requirement should be reduced for that portion of funding. However, we would not oppose a statutory change that would permit the state to set aside a percentage of their regular SRF capitalization specifically for rural and/or economically-distressed communities if they so elected. A voluntary set-aside would not restrict state flexibility. However, if the set-aside is voluntary, the state matching requirement should not be lowered since the federal government would not be supplementing the regular capitalization grant with any additional funding.

### **Grants Programs**

We believe that the many adjustments to the State Revolving Loan Fund program that we have recommended above will increase the attractiveness of the loan program to rural communities and increase their ability to obtain an SRF loan. Nevertheless, for some small and rural communities it is clear that any loan payback provision is prohibitive. Recognizing that a grants program may be the only source of funding for the most disadvantaged of the small communities, NSPE urges Congress and the Administration to enhance existing federal programs that provide grant and loan assistance to small and economically-distressed communities in agencies such as the Rural Development Administration (formerly part of the Farmers Home Administration), Economic Development Administration, and the Community Development Block Grant program. These agencies have a great deal of experience addressing the special

needs of small and rural communities and are capable of integrating wastewater treatment funding with other economic development projects.

We urge that the Congress and the Administration direct greater attention to these programs, both in boosting the technical capabilities of regional staff who administer these programs, and in providing higher appropriations so that they become truly useful funding sources for the many rural and economically-distressed areas that need grant assistance. While we realize that this Committee does not have primary jurisdiction over these programs, we hope that you will cooperate with the other relevant committees to ensure full funding of these programs.

Because of the availability of the Rural Development Administration and other federal programs, as well as state grant programs that have been established to fill any gaps left by the conclusion of the EPA Construction Grants program, we believe that a renewal of the former Construction Grants program or the establishment of a comparable program within the U.S. Army Corps of Engineers is unnecessary and, in fact, counter-productive to the goals of the 1987 Amendments to the Act. Reauthorization of a construction grant program sends an entirely inappropriate message to states and localities that the federal treasury is again "open for business" since there are not sufficient federal resources to fully fund environmental infrastructure programs in all of the potentially eligible communities. Such a return is also inconsistent with efforts by the Administration and Congress to reshape governmental programs so that they operate more efficiently and flexibly. For ten years NSPE has stated its opposition to a grant program in the belief that it created disincentives for states and localities to provide their own funding for wastewater treatment, delayed the construction of facilities, and created an inefficient funding stream by imposing costly administrative burdens which inevitably accompany federal funds.

#### **Private-Public Partnerships**

We do not want to overlook an additional mechanism for providing wastewater treatment facilities to rural communities that should continue to be explored -- private sector operation or ownership of such systems. Given the limited public funds available for environmental infrastructure and the intense competition for these funds, it seems prudent to encourage the private sector to fund such projects if they are so inclined. The private sector, including some engineering firms, is already directly involved in treatment plant operation and ownership. In many cases a low interest loan, or in the case of small communities, a partial grant, may make privatization financially feasible. Our current NAFTA partner to the South, Mexico, is heavily privatizing utilities to take such expenses off-budget. A striking example is the entire water system of Mexico City. We support legislative and regulatory changes that would remove obstacles to private sector participation in providing water and wastewater treatment or water supply services to rural areas, as well as to large communities. We encourage this Subcommittee to use the reauthorization process to make appropriate changes to the Clean Water Act.

### **Revolving Loan Assistance Funds for Potable Water Supply and for Solid Waste Disposal**

While this topic does not specifically address the subject of today's hearing, we believe the issue must be raised because of the potential interconnection between existing wastewater financing programs and proposed companion programs for meeting other environmental infrastructure priorities. This issue has particular relevance to today's hearing because proposals have been introduced previously that would have established rural environmental infrastructure accounts serving wastewater, drinking water, and solid waste disposal needs concurrently.

As is the case for wastewater treatment infrastructure, small communities have been particularly burdened by that lack of adequate funding for potable water supply systems and municipal solid waste disposal facilities. The case for establishing a revolving loan program for potable water systems is particularly strong. EPA's Office of Drinking Water estimates that \$1.2 billion annually, or 69 percent of the total compliance costs for new drinking water regulations, will fall upon small community water systems. If the federal government is to set increasingly rigorous demands for drinking water, a federally-supported state revolving loan assistance fund should be established. We also support the establishment of a revolving loan fund for municipal solid waste disposal facility construction. Such programs should be modeled on the SRF wastewater program as it was originally conceived, but should incorporate the modifications we have also recommended earlier in this statement for the wastewater loan program. It is important that in designing any future revolving loan funds, we do not repeat the same mistakes.

Before establishing revolving loan funds for environmental infrastructure projects other than wastewater treatment facilities, we caution the Congress to carefully consider whether they are willing to commit the financial resources over the long term to such programs. While the SRF program certainly offers a potential model for meeting other infrastructure needs, it will only succeed if adequate funds are provided. It would be particularly unfair to state and local governments and to the public to promise new federal funds for such environmental infrastructure, only to weaken the programs with inadequate funding in the future. Furthermore, the establishment of new revolving loan programs should not decrease the amount of funds available for capitalizing the wastewater SRFs. Instead, any new SRF program should be funded through separate appropriations.

In this regard, it is essential that the accounts for the various environmental infrastructure revolving funds be kept separate. Traditionally, local governments have been more successful at obtaining community approval of increased water rates than they have for wastewater treatment or solid waste disposal fees. If the accounts were combined, the temptations would be great for local governments to increase water rates to cover the costs of wastewater treatment and solid waste disposal. It is also important to keep the accounts separate so that the public can see the relationship between the service provided and its cost.

While we argue that the accounts should be kept separate, this would not preclude the states from administering the funds through a central environmental infrastructure financing authority. On the contrary, we would encourage such management as it would eliminate duplicative

administrative and organizational structures. Furthermore, centralized management would provide local governments "one-stop" access to environmental infrastructure funding assistance options. This efficiency would be particularly valuable to rural communities which are expected to be primary beneficiaries of the proposed revolving funds for drinking water and solid waste disposal.

The National Society of Professional Engineers appreciates the opportunity to present our viewpoints to you on the important issues facing the nation regarding wastewater treatment infrastructure, and in particular, the impacts of national environmental infrastructure policies on the nation's small communities. We commend you for including the engineering profession in this discussion and for listening to our recommendations. We look forward to continuing to provide assistance to you as you craft sound public policy on water quality issues.

ROBERT A. RAPOZA ASSOCIATES

Statement  
of

Laura Paradise, Policy Associate,  
Rapoza Associates

before

The Subcommittee on Water Resources and Environment  
Committee on Public Works and Transportation  
U.S. House of Representatives

February 23, 1993

## Introduction

Mr. Chairman, my name is Laura Paradise and I work as a Policy Associate with Rapoza Associates, a consulting firm that conducts policy research and provides legislative support on rural and low-income community development issues. For the past five years, we have collaborated with the Center for Community Change and the Rural Community Assistance Programs on research activities that address rural poverty needs. We have developed numerous reports and conducted briefings on rural drinking water and wastewater concerns, including the impact of recent changes in Clean Water Act funding, thanks to support from The Aspen Institute and The Ford Foundation.

It is particularly a pleasure to appear before this Committee to discuss the wastewater facility needs of rural communities and small towns. For too long, there has been inattention to rural wastewater needs. Historically, rural wastewater projects have not been a Clean Water Act funding priority. As a result, rural areas received only a small share of EPA Construction Grants assistance, and they are not likely to obtain an increasing share of funding from the new state revolving loan funds. As part of this testimony, I will first describe the wastewater problems of rural communities and then provide some recommendations to the Committee on measures that can be taken to address these needs.

It will become evident as I describe our research findings that, unless resources are targeted to rural areas, substandard conditions will persist. All communities, rural and urban, require adequate sewage treatment facilities to protect public health. Further, communities have limited prospects for growth and development if they are not able to provide basic environmental infrastructure services. Rural America will continue to suffer from economic decline and outmigration unless its infrastructure needs are addressed.

But before I begin, I would request that the Executive Summary from Through the Revolving Door: An Analysis of Rural Wastewater Facility Financing be included in the record. This report is the most comprehensive analysis of the impact of changes in Clean Water Act financing on rural communities, and was developed in consultation with regional, state and federal agency representatives.

### Rural Wastewater Facility Needs

Today, 71 percent of the US population is served by municipal wastewater treatment facilities. A majority of the population is served by a relatively small share of all facilities.

Ninety percent of all facilities are small by definition, and serve populations of fewer than 10,000.

Every two years, EPA conducts a needs survey of wastewater projects necessary to meet federal Clean Water Act compliance requirements. The survey provides information on the backlog of compliance needs and cost estimates by project type.

The 1988 EPA Needs Survey showed that \$63 billion is required to bring facilities nationwide into compliance with current federal standards. A quarter of the national total -- \$13.7 billion -- represents the backlog to address unmet rural needs. Wastewater treatment facility construction or expansion projects make up the largest share of the rural backlog in terms of overall cost.

Nearly three fourths of all identified projects in the Survey address facility needs of rural areas. Rural wastewater facility projects are required to address the following: 1) the greatest national need for secondary treatment facilities to meet Clean Water Act standards; 2) the highest incidence of noncompliance with wastewater discharge permit standards; and 3) the largest share of all proposed new construction to develop sewer collection and treatment facilities where none currently exist.

What do national figures tell us about rural facility needs?

The data show that, even where rural areas are served by municipal sewage collection and treatment facilities, these facilities are not providing adequate sewage treatment. Moreover, estimates show that numerous rural households continue to rely on substandard individual systems that must be replaced by municipal sewage collection and treatment facilities.

1. Rural facilities account for the greatest national need for secondary treatment facilities to meet Clean Water Act standards. One in six facilities in rural poor counties are discharging either raw sewage or sewage treated at standards below those required for secondary treatment. More than 16 percent, twice the national rate, of facilities in rural poor counties are not providing secondary treatment.

2. Rural treatment facilities exhibit the highest incidence of noncompliance with wastewater discharge permit standards. A quarter of currently operating wastewater treatment facilities located in rural areas are violating their discharge permits. Facilities serving poverty-level residents in rural areas have the worst compliance record, with 30 percent discharging sewage effluent into surface waters at a higher level of contamination than their permits allow.

3. Perhaps most significant, numerous rural households continue to be served by substandard waste disposal facilities, including outhouses, cesspools and "straight" pipes that discharge untreated waste into neighboring streams. EPA data show that rural community facility needs account for 90 percent of all proposed new construction -- building on a site where no municipal facility currently exists -- activity nationwide.

EPA data focuses on regulation-related needs, but offers little additional information about a community's ability to pay or management capability. Because rural Americans are more likely to be poor than other citizens, rural systems may be severely limited in their ability to finance federally-required system improvements. In fact, our research shows that rural systems may exhibit a greater rate of noncompliance than small systems because of the level of poverty among rural residents. Therefore, income considerations must be a component of rural wastewater facility compliance improvement strategies.

#### **Rural Noncompliance is Tied to Financial Constraints**

In 1990, we surveyed state revolving loan fund staff throughout the country to learn more about rural wastewater facility needs. Our research shows that the financial and management characteristics of rural communities contribute to the high rate of noncompliance among rural facilities. In fact, the financial limitations of rural communities and small systems create a vicious cycle by reducing these communities' ability to finance required capital improvements or generate revenues needed to operate and maintain facilities.

Thirty-two states reported that wastewater facility compliance problems are prevalent in communities whose residents who can least afford to finance required improvements. Limited revenue generating capability, poor financial management practices and little or no capital planning contribute to ongoing facility problems.

Our survey found that:

1. Wastewater facility compliance problems are prevalent among facilities serving poor residents. Noncomplying facilities typically serve a small, often rural, low-income customer base with limited debt repayment ability.

2. Facility noncompliance is often caused by poor operation and maintenance. User charges are often too low to generate sufficient revenues to cover the costs of facility maintenance, equipment repair and replacement. And, many rural facilities do not employ trained operators.

3. Limited financial capability presents an impediment to addressing facility needs. Rural communities that require new municipal facilities cannot develop affordable projects because they cannot achieve economies of scale or spread project costs. High per-capita costs make projects unaffordable for many rural, lower income residents.

4. Households served by small and rural facilities often pay a larger share of their income for wastewater services than do residents served by metropolitan facilities. Moreover, these households are predicted to experience the greatest increases in annual costs to comply with emerging environmental requirements. It is possible that there will be an increasing number of service shut-offs among rural low-income households because user charges are unaffordable.

#### Clean Water Act Funding

Our research focused primarily on the impact of the Clean Water Act amendments of 1987 which authorized the termination of the EPA Construction Grants program and the creation of State Revolving Funds (SRFs) to replace Construction Grants as a permanent source of wastewater treatment facility financing.

The Construction Grants program for wastewater treatment projects, authorized under the 1972 Clean Water Act amendments, ranks as the second largest domestic public works spending program. Between 1972 and 1990, more than \$55 billion in Construction Grants assistance was invested in municipal wastewater treatment facilities benefitting more than 57 million Americans.

EPA and Construction Grants staff agree that Clean Water Act priorities directed funds to larger municipalities where greater water quality and public health impacts could be achieved. The cost and complexity of preliminary requirements also benefitted communities with greater organizational skills and technical

capability and, to some extent, weeded out smaller, often rural, communities with less technical expertise.

Many small and rural communities have only recently achieved Construction Grant priority funding status, given competition from larger municipalities and time delays associated with federal requirements. Small communities, defined by EPA as communities with fewer than 3,500 persons, received only 11.71 percent of all Construction Grants assistance, totaling \$5.272 billion. Yet, communities of this size account for more than 70 percent of all U.S. municipalities.

Since Fiscal 1990, SRFs are the primary source of wastewater treatment funding available to help public entities comply with federal standards. SRFs are not required to target rural wastewater needs or provide increased subsidies to low-income communities. The extent to which such needs are effectively targeted depends on state program priorities. SRF loans may be issued for a maximum 20-year term and may not be offered as grants.

#### **National State Revolving Fund Survey**

We surveyed state revolving fund staff nationwide to evaluate if the SRF was an effective finance mechanism to address rural facility needs. Although states have increased flexibility in setting SRF funding priorities, establishing set-asides, and offering loan subsidies, they are required to ensure that the long-term viability of the fund is protected as a permanent source of financing when the federal capitalization period ends in Fiscal 1994.

Many states reported that they are issuing a majority of loan monies to larger, more creditworthy municipalities in order to meet their financial management obligations, while protecting the corpus of the fund. Rural and lower income communities are often considered greater credit risks because they lack bond ratings and have limited revenue-generating capability. In fact, our findings show that greater financial management scrutiny in the SRFs highlights the dilemma faced by many rural communities: financial and management limitations restrict their ability to gain access to funding.

State survey response confirms the importance of addressing rural financial and management constraints as part of an effective rural wastewater facility assistance strategy. States overwhelmingly agreed that affordability is the most critical factor in rural low-income facility financing. Of 42 states responding to the survey:

- 23 states consider the lack of grant funds to be the greatest obstacle to addressing rural low-income facility needs; and

- 19 states report that excessive project costs, based on dollar per household cost, is the largest impediment to financing rural facility projects with SRF loans.

In short, the SRF by itself is not a viable financing option for many rural and rural poor communities.

We also analyzed SRF loan portfolios from 12 states to determine if rural, lower income communities have been able to obtain loans. Overall, SRFs surveyed were able to finance projects that served small, rural moderate-income communities. Lower-income borrowing occurred only in cases where significant interest-rate subsidies or supplemental grants were offered to reduce user charges to an affordable level.

SRFs are less able to address the needs of lower-income and very small communities that have limited debt-repayment ability. Even zero percent interest loans will not result in affordable user charges when projects serve such populations.

SRF data shows that measures must be taken to address financial capability if lower-income communities are to borrow from the SRF. Interest-rate subsidies and supplemental grants are needed to reduce per-household costs to an affordable level. The need for supplemental grants is most pronounced in new sewer service projects that serve small, rural populations and lower-income households. High per-capita costs associated with new sewer service projects make 100 percent debt financing an untenable option for many rural, lower income households.

Finally, SRF data shows that rural communities require technical assistance both to gain access to SRF loan financing and to address operation and management needs. Many rural communities do not have the technical capability to meet preliminary loan requirements. Others require assistance to establish sound budget management practices, revise user fee systems and improve facility operations.

Attention both to capital and technical assistance needs is warranted to ensure that rural wastewater facilities meet federal Clean Water Act standards.

## Recommendations

In closing, I would like to offer several recommendations to more effectively target rural wastewater facility needs within the Clean Water Act.

As the financial and management capability of SRF applicants become more important criteria in evaluating projects, it is necessary to better identify financing and management needs. The national Needs Survey should include detailed data on financial and management needs so that analysts may assess facilities' ability to maintain compliance.

Based on new Needs Survey data, technical assistance programs should be implemented to help communities improve financial capability and facility management.

A separate fund should be established to provide funding subsidies for rural wastewater facility projects based on economic need and other affordability criteria. In order to meet affordability criteria and address rural poor facility needs, additional funds and extended federal capitalization should be authorized to provide loan interest subsidies, loans at terms of up to 40 years, and supplemental grants for small, rural, low income communities.

Technical assistance should be provided to rural communities, to evaluate the financial viability of developing and maintaining new sewer facilities. In addition, assistance should be provided to evaluate facility management options that will result in the development of viable facilities, including satellite management, regionalization or implementation of septage management districts.

That concludes my statement. Mr. Chairman, Rapoza Associates and the Center for Community Change and Rural Community Assistance Programs, appreciate this opportunity to discuss rural wastewater facility needs. I would be happy to answer any questions which you or other members of the Committee may have.

## EXECUTIVE SUMMARY

### Why Examine Rural Wastewater Facility Needs?

WATER QUALITY is a matter of increasing concern in cities and towns across the United States. Federal and state regulators report that drinking water and sewage treatment facilities serving small, mostly rural populations currently have the highest rates of noncompliance with federal environmental standards. In 1988, more than 90 percent of all small water systems were in violation of Safe Drinking Water Act standards, and the noncompliance problem is expected to become even more severe as increasingly stringent environmental standards are implemented.

Small systems typically need financial and management assistance to upgrade and maintain systems to federal standards. A system with a small customer base has limited revenue-generating capability, cannot achieve economies of scale, and cannot spread costs effectively. Regulators and financial analysts predict that households served by small systems face extraordinarily large increases in water and sewer charges associated with evolving environmental standards. There is clearly a need for coordinated strategies to address the "small system problem."

By definition, most of the water and sewer systems in rural America *are* small systems. Their noncompliance problems are compounded by the socioeconomic characteristics of rural areas. In many parts of the United States, rural infrastructures have never been adequate and have been deteriorating even more severely than their urban counterparts. The need to modernize existing water/sewer systems — and, at even greater cost, to create new systems where none now exist — is a challenge beyond the capabilities of many small rural communities. And because rural households are, on the average, more likely to be poor than households served by urban-suburban systems, rural systems are at a particular disadvantage in financing federally required system improvements. Their customers are poor; their

communities typically have a limited tax base and a low or nonexistent credit rating. The noncompliance problems of these systems, however, have been inadequately documented; relatively little national data is available on the water and sewer needs of rural communities — which makes it all the more difficult to address those needs.

This report was undertaken as part of an effort to clarify the wastewater facility needs of rural and rural poor communities and to assess the outlook for addressing these needs in light of changing environmental regulations. Our goals are twofold: 1) to examine the current status of rural wastewater treatment systems; and 2) to determine whether rural communities will have access to affordable funding to address their environmental infrastructure needs.

### The Impact of the Water Quality Act of 1987

The primary focus of the report is on the impact of the Water Quality Act of 1987, which authorized the termination of the Environmental Protection Agency's Construction Grants program and provided a process for establishing state revolving funds (SRFs) to replace EPA Construction Grants as a permanent source of wastewater treatment facility financing. Unlike the Construction Grants program, which provided grants directly to local entities, SRFs are loan programs in which the initial capital is provided by federal "seed money" augmented by state funds. States make loans to local entities, and as the loans are repaid, the SRF is replenished. Because of this structure, SRFs require greater scrutiny of the financial and managerial capabilities of potential borrowers than was true of the Construction Grants program. Given the limitations of many rural communities, it is important for policymakers to know whether this major change in financing wastewater treatment needs will be successful — and, to the extent that SRFs fall short of meeting the need, it is equally important to identify necessary changes.

The Water Quality Act established a schedule for phasing-out the Construction Grants program by Fiscal Year 1990 and provided guidelines for establishing and operating federally capitalized SRFs. The Act requires states to comply with federal requirements when issuing loans obtained as a direct result of federal capitalization grants. States must also ensure that the long-term viability of the revolving fund is protected as a permanent source of financing after the federal capitalization period ends in FY 1994. Further, states will continue to be responsible for ensuring that publicly owned wastewater treatment facilities meet federal standards *with or without federal funds*. The transition to SRFs is perhaps the most significant change wrought

by the Water Quality Act, because it marks the end of a 20-year period of federal capital grant investment in municipal wastewater treatment facilities.

The Water Quality Act does not require state revolving funds to target rural wastewater needs or to provide increased subsidies to low-income communities. The extent to which such needs are effectively targeted thus depends on state program priorities. Accordingly, a nationwide survey of SRFs was conducted for this report to identify actions that states are taking to address rural wastewater facility needs.

*Through the Revolving Door* provides basic data on rural wastewater facility needs in order to facilitate an evaluation of the match between needs and program priorities. The report then assesses the impact of changing wastewater facility funding policy on the distribution of funding in federally capitalized SRFs and in the other two principal sources of funding: Farmers Home Administration (FmHA) Water and Waste Disposal Loans and Grants and state bond banks. The report examines the accessibility and affordability of all of these funding resources to determine whether there is a match between rural capacity and funding program design, and offers four state case studies — Arizona, Minnesota, Washington, and West Virginia — to assess this question in varying contexts. The report also looks at the possible advantages of enhancing access to credit by creating a federally sponsored bond marketing authority specifically to underwrite rural water and sewer projects. Finally, *Through the Revolving Door* offers a number of policy recommendations aimed at helping rural poor communities to more effectively address their wastewater facility financing requirements.

### The Environmental Regulatory Context

Since the establishment of the U.S. Environmental Protection Agency in 1970, federal environmental regulation has evolved to address emerging public health and environmental quality problems in all sectors of government, business and industry. Federal regulations currently govern a wide range of services provided by local governments including sewage treatment, drinking water, hazardous waste disposal and solid waste management.

Early federal environmental regulation focused primarily on controlling major sources of pollution such as industry (e.g., automobile emissions standards) and large cities (e.g., basic sewage treatment requirements). The drinking water and sewage treatment problems of rural communities were not a regulatory priority, and relatively little federal funding was obligated to help rural communities comply with federal standards.

More recently, the scope of environmental regulation has broadened to include communities whether large or small, urban or rural. Persistent, much-publicized problems — such as toxic waste dumps and groundwater contamination — have reinforced public support for better protection and tougher standards. The cost of implementing and complying with environmental standards has escalated steadily as the scope of environmental regulation has grown. At the same time, however, the federal role in financing environmental services has been on the decline, particularly since 1981, and states and local governments are increasingly responsible for financing environmental compliance. Whether they can muster the necessary resources — let alone target them fairly and effectively — is unclear. Paying for environmental programs and environmental services is one of the major challenges of the 1990s.

EPA's Office of Municipal Pollution Control, which enforces federal Clean Water Act regulations, has estimated that it will cost \$63 billion to bring the nation's wastewater treatment facilities up to federal standards. This estimate, it should be noted, is based on serving the *current* U.S. population, and not on projections of future needs. Currently operating facilities serve 71 percent of the U.S. population; when these facilities have been upgraded, 248 million people — 87 percent of the population — will be served by up-to-code systems.

EPA's Office of Drinking Water, which enforces the drinking water standards of the federal Safe Drinking Water Act, estimates that an additional \$7 billion will be needed nationwide annually to cover total capital costs for upgrading treatment to comply with the contaminant requirements incorporated in the Act's 1986 amendments, and an additional \$1.7 billion annually will be needed to cover system monitoring and reporting requirements which were also part of the amendments.

These estimates may be conservative. The General Accounting Office uses \$83.5 billion as a ballpark estimate of the cost of financing the nation's current wastewater treatment needs.<sup>1</sup> Estimating is something of an art, given the scope of the problem, the rapidly escalating cost of public works construction, and the fact that few federal laws have either required EPA to assess the costs of compliance or provided for adequate data collection.

In any case, the challenge of financing the nation's wastewater treatment needs must be viewed in a broader context: the entire panorama of unmet environmental needs — from ozone to ocean. EPA has calculated that

---

<sup>1</sup> U.S. General Accounting Office, *Water Pollution: States' Progress in Developing State Revolving Loan Fund Programs* (GAO/RCED-91-87), Washington, D.C., March 1991.

the public and private sectors will need an additional \$61 billion *each year* to meet current and new environmental mandates between now and the year 2000.<sup>2</sup> Where will the money come from? That question haunts the federal and state regulators and financial analysts who have been exploring options for financing the nation's wastewater treatment needs.

### Finding Funding for Regulatory Compliance

In the 1970s, the federal government assumed a large share of the costs for regulatory enforcement and environmental services. Since 1972, Congress has authorized funding for municipal sewage treatment facilities nationwide under the Clean Water Act. The Safe Drinking Water Act, which sets forth regulatory standards for public drinking water systems, has never included funding authorizations to help systems meet compliance requirements. The Consolidated Farm and Rural Development Act of 1961 and subsequent amendments have enabled the Farmers Home Administration to make a significant financial investment in low-interest loans and grants for both drinking water and sewage disposal projects serving rural low-income communities, particularly since 1972. However, FmHA funding programs were established simply to help rural and rural poor communities obtain affordable financing for needed public works projects; FmHA's programs were not intended or designed to address regulation-driven needs.

Since 1981, the federal government has increasingly delegated enforcement and funding responsibility to state governments. They, in turn, have relied heavily on the municipal bond market, user fees, and tax assessments. Individual households have thus become increasingly responsible for — and burdened by — paying the cost of financing capital construction and facility operation and maintenance. Barring a major shift in federal-state-local relationships, this trend is expected to accelerate throughout the 1990s.

The EPA Construction Grants program for wastewater treatment facility funding, authorized under the 1972 Clean Water Act amendments, ranks as the second largest domestic public works spending program. Between 1972 and 1990, more than \$55 billion in Construction Grants assistance was invested in municipal wastewater treatment facilities serving more than 57 million Americans.<sup>3</sup> Construction Grants funding priorities targeted larger municipalities because of high population density, large

---

<sup>2</sup> U.S. Environmental Protection Agency, *A Preliminary Analysis of the Public Costs of Environmental Protection: 1981 - 2000, 1990*.

<sup>3</sup> *EPA Journal*, December 1987.

volume of wastewater flow, and the resulting impact of improved facilities on surface water quality.

Under the Water Quality Act of 1987, federally capitalized state revolving funds are now replacing Construction Grants as the primary source of wastewater treatment funding available to help public entities comply with federal standards. Federal requirements apply to SRF loan funds that have been obtained as a direct result of federal capitalization. SRF loans may be issued for a maximum 20-year term and cannot be offered as grants.

Overall, debt financing has become the predominant financing mechanism for water and sewer projects. Local governments may currently borrow to finance capital projects from SRFs, state bond banks and financing authorities. Some state and federal programs continue to offer grants, but program guidelines generally require applicants to borrow to cover some share of project costs. The FmHA Water and Waste Disposal Loan and Grant is the largest funding program that offers funding subsidies for projects serving rural and rural poor communities. FmHA offers grants to help lower income communities reduce user charges to affordable levels. Applicants must meet debt service guidelines and demonstrate economic need before grants will be awarded for projects.<sup>4</sup>

As noted, Clean Water Act priorities directed funds mainly to larger municipalities where greater water quality and public health impacts could be achieved by constructing and upgrading wastewater treatment plants. The cost and complexity of meeting preliminary Construction Grants requirements also tended to favor communities with greater organizational skills and technical capabilities — and, by the same token, tended to freeze out smaller, often rural, communities with less technical expertise.

Because of the competition from larger municipalities and the time delays involved in meeting federal requirements, many small and rural communities have only recently achieved Construction Grant priority funding status. Large metropolitan areas with populations greater than 500,000 received nearly 25 percent of all Construction Grants funding — some \$10.926 billion — between FY 1973 and FY 1990. Regardless of their importance, communities of this size represent only .2 percent of all municipalities nationwide. During the same time period, small communities (defined by

---

<sup>4</sup> It should be noted that FmHA may obligate grants totalling up to 75 percent of total project costs to applicants with incomes below the national poverty level for projects that address environmental violations and public health hazards. FmHA has awarded an increasing share of grant funds, nearly 70 percent of each community's FmHA contributions in FY 1988, to low-income communities that received grant funding from FmHA.

EPA as those with populations below 3,500) received 11.7 percent of all Construction Grants assistance, totalling \$5.272 billion. Yet communities of this size account for more than 70 percent of all U.S. municipalities — and for a large share of the facility needs of many states. In Pennsylvania, for example, small communities account for the majority of the state's facility needs, estimated at \$3.2 billion in 1988; but large municipalities, especially Philadelphia, received the majority of federal assistance.

### How Regulators Identify Wastewater Facility Needs

The 1972 Clean Water Act required EPA to conduct a national survey of municipal treatment works every two years to assess the capital investment needed to build or improve municipal treatment facilities that meet federal standards. EPA Needs Survey data is submitted to Congress and serves as the basis for determining the allotment of funds for the Construction Grants program. The data has also allowed Congress to evaluate the impact of federal wastewater facility funding on facility compliance status. The 1988 EPA Needs Survey does not reflect changes in funding eligibilities or enforcement requirements set forth in the 1987 Water Quality Act.

The biennial Needs Survey provides the most detailed information available on the compliance status of the nation's municipal wastewater treatment facilities. EPA has established documentation criteria for cost estimates and facility needs to ensure that identified needs are accurate and address compliance requirements.

### National Wastewater Needs Data

1988 EPA Needs Survey data and interviews with SRF staff nationwide provide the basis for rural and rural poor wastewater facility needs data presented in this report. However, EPA Needs Survey data contains only *documented* facility needs that address regulatory compliance. SRF staff nationwide agree that rural needs are underrepresented in national needs data because rural communities often lack sufficient needs documentation. For example, 39 states submitted separate facility needs estimates to supplement the 1988 EPA Needs Survey showing that there is a critical need to develop new municipal wastewater treatment facilities in rural areas that are currently served by individual on-site systems. Separate needs estimates did not, however, meet EPA documentation criteria.

EPA's survey focuses on regulation-related needs, but offers little additional information about the applicant's ability-to-pay or management

capability. And the only information about the facility service population contained in national data is the number of residents that are or will be served by treatment and collection facilities. We found that *EPA's Needs Survey as presently structured does not allow analysts to determine whether communities have the financial or management capacity to address identified facility needs and achieve compliance.*

### **Wastewater Facility Needs in Rural Poor Communities**

According to the 1988 EPA Needs Survey, \$63 billion is required to bring existing and planned facilities nationwide into compliance with current federal standards. There will be 24,141 facilities nationwide when all documented facility needs are met.

*EPA data show that 75 percent of all documented facility needs are in rural communities of fewer than 10,000 persons. The estimated cost of addressing rural community needs is \$13 billion — almost a fourth of the national needs estimate. But because EPA data provide the basis for state SRF allocations, states with significant rural needs will receive considerably less federal SRF funding than states with higher-cost urban projects.*

We found that wastewater facilities in rural and rural poor counties account for: 1) most of the backlog of secondary treatment facilities needed to meet Clean Water Act standards; 2) the highest incidence of noncompliance with wastewater discharge permit standards; and 3) the largest share of all noncompliance situations requiring new construction and treatment facilities where none now exist.

There is a disproportionately high need for physical and operational wastewater facility improvements in rural poor counties in the South. The region has 36 percent of all facilities in rural poor counties nationwide but accounts for 44 percent of all documented noncompliance among such facilities. Further, the need for new collector sewers — indicative of the need for new sewer systems — is greatest in the South, where such needs account for 35 percent of the region's total rural poor facility needs.

SRF staff confirm that limited financial capacity and poor operation and maintenance contribute to the high incidence of noncompliance among facilities serving rural poor communities. *This same problem — inadequate financial capability — creates an impediment to addressing rural poor facility needs. SRF staff report that many rural poor communities that require new municipal facilities cannot develop affordable projects because they cannot achieve economies of scale or spread project costs effectively.*

## Transition to State Revolving Funds

Based on a nationwide survey of SRFs, we found that *rural poor wastewater facility needs will not be adequately addressed in state revolving fund programs*. SRF staff report that rural poor facility projects that were not addressed during the Construction Grants program — specifically new sewer collector and treatment facility projects — cannot be financed with 100-percent loans, regardless of interest-rate subsidies.

Federal SRF requirements restrict states' ability to target rural poor facility needs by offering more accessible or affordable funding. Preliminary loan requirements present an obstacle to many rural communities that lack the capability to finance technical studies, and SRF loan priorities reward applicants that are ready to proceed to construction. This acts as a further barrier to rural poor communities. Communities with greater financial resources are more likely to be able to take advantage of the rural set-asides available in 16 states (averaging 10 percent of total SRF funds in those states).

States are seeking to accelerate compliance with federal requirements so that revolved funds may be loaned with greater flexibility. More than half of all SRFs are therefore issuing the vast majority of loan funds to larger municipalities that have the financial and organizational capability to meet federal requirements and loan conditions. Cities are more likely to be ready to proceed to construction — because they are more likely to have met preliminary requirements. Many are able to repay loans on accelerated schedules because of their revenue-generating capability. Although the goal of this strategy is to generate a healthy repayment stream that will enable SRFs to make loans with no federal strings attached, the effect is to give larger municipalities easier and earlier access to limited funds. Low-income rural communities face the prospect of having to wait for revolved funds to trickle down to them at some uncertain time.

## Principal Findings

### Rural Wastewater Facility Needs

- Reliance on inadequate individual ("on-site") septic systems is prevalent in rural and rural poor communities. *Failing septic systems need to be replaced by new municipal collection and treatment facilities.*

- *More than 16 percent of the facilities in rural poor counties are not providing secondary treatment.* This is twice the national rate. One out of every six facilities in rural poor counties is discharging either raw sewage or sewage

that has been treated insufficiently to meet secondary-treatment standards. Inadequate treatment is most prevalent in poor rural counties in the South, particularly in Arkansas, Mississippi and Louisiana.

■ *24 percent of currently operating wastewater treatment facilities located in rural counties are violating their effluent discharge permits.* Facilities in poor rural counties have the worst compliance record, with 30 percent discharging effluent into surface waters at higher levels of contamination than their permits allow.

■ *32 states report that wastewater facility compliance problems are prevalent among facilities serving residents who can least afford to finance required improvements.* Non-complying facilities typically serve a small, often rural, low-income customer base.

■ *Rural poor facility noncompliance is most often caused by poor operation and maintenance.* Revenues do not cover the costs of facility maintenance and equipment replacement, and facilities often do not employ trained operators. As a result, such systems may lack the capacity to maintain compliance even when facilities are upgraded.

### State Revolving Funds

■ *States are targeting SRF loans to larger municipalities with greater financial and organizational capability because they have met preliminary requirements and are ready to proceed to project construction.*

■ *States are overwhelmingly providing incentives for accelerated loan repayment schedules and encouraging disbursement of large loans tied to federal capitalization monies.* More than half of all states are:

- providing interest-rate subsidies to borrowers able to enter into short-term loans, regardless of the borrower's need for subsidized assistance;
- encouraging participation of cities with high bond ratings to enhance the marketability of SRF bonds; and
- lending to projects that have met all preliminary planning and design requirements by providing high priority ranking for readiness to proceed to construction.

■ *Facilities with small customer bases serving low-income households are unlikely to be able to afford SRF loans and will require grants to address their wastewater facility needs.* Forty states anticipate that some small systems will be unable to afford SRF loans; 23 states consider the lack of grant funds to be the greatest obstacle to addressing rural low-income facility needs; and 19 states report that excessive project costs, based on dollars-per-household cost or user rates as a percentage of median household income, are the largest impediment to financing rural facility projects with SRF loans.

■ *34 states are taking actions to target a share of SRF funds to small, rural and low-income facilities.* However, such actions are likely to benefit only those facilities that can otherwise qualify for SRF funds and can afford to meet debt repayment requirements. *Unless rural poor communities can meet preliminary requirements, they will not have access to SRF loans even if funding terms are affordable and funds are earmarked for rural low-income communities as a group.*

■ *16 states are setting aside funds for a target population or project type that benefits small, rural and/or low-income communities.* Excluding the New York SRF, in which \$93 million has been set aside for small and low-income communities, the average set-aside is 10 percent of the SRF allocation, or \$4.1 million.

■ *SRFs in eight states — Illinois, Kansas, Missouri, New Jersey, Ohio, South Carolina, Washington, and Wisconsin — have established a separate project category to address rural facility needs, primarily for new sewer facilities in unsewered areas.*

■ *SRFs in 12 states — Delaware, Kentucky, Maryland, Minnesota, Montana, Nebraska, New York, Pennsylvania, Tennessee, Utah, Virginia and West Virginia — offer loans at interest rates on a sliding scale to as low as zero percent, based on ability-to-pay or demonstrated economic need.*

■ *SRFs in 10 states either offer or are planning to offer loans at two fixed interest rates, with the lower rate (usually zero percent) reserved for facilities serving "hardship" areas experiencing economic distress.* The states are Indiana (proposed), Minnesota, New Mexico, Ohio, Pennsylvania, South Carolina, Texas, Vermont, Washington, and Wisconsin (proposed).

■ *Subsidized interest rates are also offered for specific project types.* Both Arkansas and New York offer lower-interest-rate loans for projects that utilize innovative/alternative (I/A) technologies to encourage the use of lower-maintenance-cost technologies in rural areas. Wisconsin and Illinois SRFs offer interest-rate subsidies for unsewered community projects.

■ Some states are developing operation and management assistance programs to help rural poor facilities improve budget management, establish sufficient user-rate schedules, and develop maintenance plans to meet compliance requirements.

### Potential Impact of SRFs on Other Funding Resources

#### Farmers Home Administration

FmHA project funding data from FY 1985 to FY 1988 was used to evaluate FmHA's role in sewer project funding. Water projects account for more than half of all FmHA-funded projects during this period; FmHA sewer projects represent 40 to 46 percent of all FmHA projects funded. Nearly a third of all FmHA sewer projects also received Construction Grants assistance, averaging 55 percent of project costs.

More rural poor communities may submit requests for FmHA assistance as a result of the transition to SRFs. *FmHA, however, cannot fill the financing gap created by the termination of the EPA Construction Grants program.* FmHA annual grant funding allocations average a tenth those of EPA. The average size of sewer projects jointly funded by EPA and FmHA is two to four times larger than sewer projects funded by FmHA.

From FY 1985 to FY 1988, FmHA funded 1,923 water projects totalling \$102.1 million in loans and grants. Because of FmHA's significant role as a funding source for drinking water projects serving rural poor communities, it is unlikely that sewer projects will come to dominate the FmHA portfolio.

#### State Bond Banks

State bonding authorities provide public entities, primarily municipalities, with access to tax-exempt credit to finance community facility projects including water and sewer infrastructure. Interviews were conducted with representatives of 13 state bond banks and seven state financing authority representatives to obtain information about the characteristics of bond bank beneficiaries, financing terms and obstacles to bond bank participation.

Historically, state bonding authorities have helped small, rural communities obtain financing at market interest rates for projects averaging \$2 million or less. Fast funding turnaround and simplified access to the bond market are the greatest savings offered by bonding authorities. Several

bonding authorities were created specifically to assist small communities obtain financing to cover the local share costs of sewer projects that also received Construction Grants assistance.

Bonding authorities may no longer serve as a financing mechanism for local-share costs following the termination of the Construction Grants program. Rather, bonding authorities may offer small, rural communities a more accessible financing alternative than SRFs because of their streamlined procedures, fast turnaround and simple preliminary requirements. However, bond bank participants must charge sufficient user rate structures to cover operating costs and annual debt fees. *Unless revenue-generating capacity and budget management practices are improved, numerous rural and rural poor facilities may not be able to borrow from either state bonding authorities or SRFs.*

### Impact of New Regulations

As noted, many SRFs are targeting the majority of their loan funds to larger municipalities in order to comply with federal requirements and protect the long-term viability of revolving funds. A smaller share of SRF funds is being targeted to rural facility needs by using set-asides, separate funding categories, and interest-rate subsidies. At issue is whether SRF targeting based on ability-to-pay will result in SRF access for rural poor communities that require substantial subsidies to complete projects.

Unsewered rural poor communities cannot afford to finance new sewer collection and treatment facility projects with 100-percent SRF loans, even with interest-rate subsidies. Yet rural poor facility needs data show that new sewer facilities account for 90 percent of documented facility needs. *Rural poor communities will not be able to provide new sanitation systems meeting federal standards unless additional subsidies are provided.*

As a general rule, the states providing SRF loan subsidies or supplemental grants to meet treatment facility needs in rural poor communities are relatively affluent — at least by comparison to other, economically distressed states. It is generally true, therefore, that in most of the states with the greatest need — that is, with the greatest numbers of inadequate facilities — rural poor communities do not have access to affordable funding.

The transition to SRFs has resulted in increased scrutiny of facility operation and management practices. Some states have developed assistance programs to help facilities improve budget management and capital improvement planning. Given the high rate of noncompliance among rural poor facilities, such assistance may be an effective means of targeting rural poor facility needs.

## Recommendations

### EPA Needs Survey Data

Clean Water Act funding has required that states address compliance problems and regulation-based needs. However, if SRFs are to issue loans on the basis of financial capability, a broader spectrum of needs factors should be included in EPA Needs Survey data. In addition to economic characteristics, information on system organization and management would allow funding agencies to determine facilities' ability-to-pay and to maintain compliance with federal standards.

The SRF state allocation formula, based on the EPA Needs Survey, reflects the significant cost of urban projects. However, the vast majority of documented facility needs are located in rural communities. The SRF allocation formula should reflect that concentration of needs.

### Rural Poor Facility Needs

EPA Needs Survey data and SRF survey responses show that rural poor communities must develop new municipal facilities. In fact, rural and rural poor communities account for more than 90 percent of the national facility need for new facilities. Water Quality Act priorities should address the need for basic infrastructure in rural poor communities.

Rural poor communities should receive at least the same level of capital investment that larger municipalities received during the Construction Grants program. Moreover, facility funding terms should be based on ability-to-pay to ensure that rural poor communities obtain access to affordability facility financing.

Regulators should investigate the reasons for the high incidence of facility noncompliance among facilities serving rural poor communities. Regulators should evaluate facility budgets, maintenance schedules, operator responsibilities and physical plant to ensure that, if upgraded, facilities can be adequately operated and maintained.

### State Revolving Funds

*Loan Accessibility:* State and federal SRF staff should develop more flexible criteria for preliminary studies so that, based on facility needs, rural

applicants may work with state technical assistance staff to develop adequate preliminary studies. When more in-depth studies are required, preliminary planning assistance grants should be available. Such measures will increase rural community access to SRF loans.

*Loan Affordability:* SRFs should be separated into two funds, one that revolves and is self-sustaining and another that functions simply as a lending institution. The self-sustaining revolving fund should offer loans to creditworthy applicants that do not require interest-rate subsidies. The lending institution should offer loans based on applicants' ability-to-pay. Debt service requirements for loan repayment should target reasonable user charge levels that combine debt repayment and operation, maintenance and reserve costs. When debt service requirements cannot be met, supplemental grants should be provided to reduce user charges to an affordable level.

*Unsewered Rural Poor Facility Needs:* Where soil and topography allow, unsewered rural communities should have access to grants to replace inadequate septic systems and to create management districts to ensure that such facilities are properly operated and maintained.

Where municipal collection and treatment facilities are needed, projects should be phased or separated into segments. Consolidation options should be evaluated as a means of spreading costs. Other cost-cutting measures such as use of self-help volunteer labor and shared equipment should be encouraged where appropriate. Rural poor communities should receive 75-percent grants for initial capital construction costs, just as larger municipalities received in the early years of the Construction Grants program. State staff should work with rural communities to encourage the use of low-maintenance cost technologies.

*Rural Poor Facility Noncompliance:* Financial audits should be conducted on all rural sewer systems. Rural communities should receive assistance to evaluate financial capability, establish budgets, and develop capital improvement plans. Facilities should be required to maintain reserve funds that can be used for capital expenses. In cases where facilities would be required to charge unaffordable user rates to cover operating expenses, facility consolidation options should be explored. In some cases, rural poor communities that did not benefit from Construction Grants may gain access to SRFs when funds are offered for preliminary studies.

STATEMENT OF A. ROBERT RUBIN, Ph.D.  
ON BEHALF OF THE WATER ENVIRONMENT FEDERATION  
BEFORE THE WATER RESOURCES AND ENVIRONMENT SUBCOMMITTEE  
HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE  
February 23, 1993

Mr. Chairman and distinguished members of the Subcommittee, I am A. Robert Rubin, Associate Professor in the Department of Biological and Agricultural Engineering at North Carolina State University in Raleigh, North Carolina.

I am here today representing the Water Environment Federation (WEF) before this Subcommittee to provide testimony regarding:

- \* Wastewater treatment needs in small communities and rural areas;
- \* Role of alternative technologies in addressing these needs;
- \* Experiences with approval and implementation of wastewater management facilities in small and rural communities;
- \* Residual management practices in these areas;
- \* Role of federal, state and local governments in promoting adoption, implementation, and life cycle management of alternative technologies in small and rural communities; and
- \* The impact of increased environmental mandates in small and rural communities.

The Water Environment Federation is a non-profit professional, educational and technical organization devoted to providing leadership and guidance in the preservation and enhancement of our nation's water resources. Founded in 1928, the Federation has over 40,000 members in 64 Member Associations, three Corresponding Associations, and seven recognized operator associations throughout the world. WEF members include environmental and civil engineers, scientists, wastewater treatment plant operators and managers, and others working in state and local government, federal agencies, industry, academia and private practice. These are the people who are responsible for implementing the nation's clean water programs.

I have over 15 years of experience in research and development of low-cost technological and institutional solutions to wastewater treatment in unsewered areas, and in the development of management, training and certification programs for individuals. My specialization is in the planning and design of affordable wastewater collection and treatment facilities in unsewered communities, remote settlements, individual homes and rural businesses and industries. My relevant experience includes:

- \* Research, development and implementation of alternative cost-effective collection and treatment technologies, including small diameter gravity sewers and pressure sewers, mounds, cluster subsurface wastewater infiltration systems, sand filters, surface irrigation facilities and biosolids (beneficially reusable sewage sludge) management;
- \* Technology assessments for U.S. EPA, World Bank and North Carolina state agencies of sand filters, small diameter gravity sewers, spray irrigation, wetlands, biosolids management and proprietary products for onsite treatment;
- \* Contribution to design manuals produced by WEF and U.S. EPA for alternative sewer systems, onsite treatment and disposal alternatives and land application systems; and
- \* Authorship of professional papers dealing with performance evaluation of alternative waste management and utilization technologies, and planning, design, construction and operation for small-scale developments.

The Water Environment Federation recognizes the unique wastewater management needs facing small communities, and has taken action to help meet those needs. We have formed a Small Community Committee to explore methods of bringing technical and other assistance to small community leaders, consulting professionals and treatment plant operators, and to further research and development of appropriate technologies geared to meet small community treatment needs. In addition, our Technical Practice Committee has published two design manuals to assist engineers in the planning and design of cost-effective facilities: "Alternative Sewer Systems" (1986), and "Natural Systems for Wastewater Treatment" (1990). A workshop entitled "New Approaches for Small Communities" was conducted at the annual WEF conference in New Orleans last September. Another workshop is planned for December 1993, and we plan to disseminate information and findings from this workshop to small

communities through member organizations of the Federation.

#### WASTEWATER TREATMENT NEEDS IN SMALL COMMUNITIES

Thousands of small communities in the U.S. are unsewered or served by inadequate wastewater infrastructure. These communities and rural areas need improved wastewater management facilities. Many rely on individual onsite treatment systems, typically some form of a septic tank/subsurface infiltration system, to provide wastewater treatment on each property. These systems are groundwater recharging systems which rely on the soil to provide the necessary treatment. While these can be very effective treatment systems when sited, sized, installed and managed properly, inadequate codes regulating their use and poor code enforcement have allowed septic tank system failures to occur. As a result, partially treated wastewater (septic tank effluent) is directly entering surface waters and groundwater. The failures often are difficult to correct because small lots or unsuitable soils preclude the repair or replacement of the onsite system. Therefore, widespread failures often lead to calls for public wastewater management facilities to address public health hazards and mitigate environmental impairment, to protect property values and to enhance economic growth.

Implementation of public wastewater facilities in small communities is difficult because most small communities lack the fiscal and technical resources for facility construction and operation. Many are rural and unincorporated with a very limited tax base and ability to pay. Their economies often are based on agriculture, mining, unskilled labor or tourism. Family incomes typically are low, with a large proportion of the residents living on fixed incomes. The fiscal dilemma is compounded increasingly by the multitude of mandates which small community infrastructure is required to address and which compete for the scarce resources available.

In addition, the community officials are likely to be unpaid, part-time volunteers with few or no technical skills in wastewater treatment planning or

operations. A recent EPA study found that 40% of governments in small communities rely completely on volunteers instead of paid staff. They may not be aware of options available to them for addressing wastewater problems, nor what they must do to get started. Available resources which could be helpful do not reach them because of the lack of effective communication channels between regulating agencies and the regulated community.

Conventional wastewater collection and treatment technologies are not always appropriate for small and rural communities. The traditional system, comprised of gravity sewers which collect wastewater from each connection for treatment at a central plant prior to discharge into a surface water, was developed for use in large urban areas with high development densities. In small communities, however, the small number of users and the low development densities result in prohibitively high per capita costs for system construction, operation, and life cycle management. In some cases, the construction costs of a traditional facility have exceeded the total assessed value of the community. Yet, it is this facility concept that most often is applied.

Selection and designation of appropriate technologies must be a concern when dealing with small communities and rural areas, as economic viability is a paramount concern. When user charges for wastewater management exceed 1% of an average family's annual income, the family's standard of living is likely to be impacted adversely.

For example, the median annual income in most small communities in North Carolina is \$15,000 to \$20,000. At a 1% limit, the user charges should not exceed \$200 per year. However, in one previously unsewered North Carolina community (Waxhaw), a user charge of \$420 per year was proposed for a conventional collection and treatment system. An innovative collection and treatment system ultimately was selected, and user charges have averaged \$240 per year. By comparison, the state-wide average for all municipalities and communities is around \$360 per year. With such high costs, small communities have difficulty in paying the costs to build and operate systems. Appropriate technology with flexible financing is critical to the development of effective

wastewater management plans for small communities and rural areas.

The high user charges usually are due to the costs of constructing the collection system. While the area to be served by sewers is sometimes an issue, the decision to construct sewers rarely is questioned. Yet, construction of sewers is the single largest cost item in conventional facilities. In urban areas, where the average length of sewer per connection is less than 15 feet, sewer construction accounts for more than 65% of the total annual costs of the wastewater facility. In small communities, the average length of sewer per connection is 6 to 7 times the urban average. As a result, sewers typically are installed only in the most densely developed area of the community, leaving residents outside the area to fend for themselves. Increasingly stringent water quality standards also are forcing small communities and rural areas to evaluate more costly treatment alternatives which include advance filtration and nutrient removal.

While financial assistance can reduce the impact of the costs of facility construction, the annual cost of operation and maintenance of a conventional secondary, advanced secondary or tertiary treatment plant can represent the greatest single cost to the users over the life of the project. The more stringent the water quality standard, the greater the operational costs and the greater the financial burden on local rate payers.

The financial incentives are greater to design and construct larger systems. Consequently, small communities have been left on their own, and they are floundering. They must meet the same environmental standards as larger communities, but they and their consultants often are led to utilize costly and inappropriate technologies in meeting those standards because of mistrust of alternative technologies.

Although the user charges for small community facilities are significantly higher than in metropolitan areas and the financial capability of the communities to pay is less, small communities have received the lowest priority for financial aid. This is because past financial assistance has gone to larger dischargers whose discharges posed a relatively greater risk to the

environment. Yet when total pollutant loading into the environment is calculated, the residents of small communities and rural areas do discharge proportionately similar constituent loads as their urban counterparts.

In North Carolina, where 55% of the population lives in rural areas and small communities, the actual input of pollutants into the environment actually is greater from these areas than from metropolitan areas. Since 1978, North Carolina has received \$1.6 billion in federal assistance for wastewater management projects, 65% of which went to projects in metropolitan areas. According to recently collected data from U.S. EPA, \$3.9 billion in needs remain, of which 50% will be required to address small community and rural area needs.

In summary, wastewater treatment needs in small communities include:

- \* Financial aid in planning, design, construction and operation of wastewater management systems (especially if stringent water quality limits force untenable cost burdens on local rate payers);
- \* Cost effective collection and treatment technologies designed to protect public health and maintain or improve environmental quality;
- \* Effective facility management plans which include administration and operation/maintenance, as well as adequate training programs;
- \* Evaluation of the appropriateness of environmental standards and facility design criteria for small communities;
- \* A comprehensive outreach program to inform community leaders of their options and to assist them in the planning process, financial planning and financial aid procurement;
- \* A training and certification program to insure system operation and maintenance throughout its life cycle; and
- \* Methods for managing residuals.

## ALTERNATIVE WASTEWATER TECHNOLOGIES

Historically, the regulatory and engineering communities have focused upon the wastewater treatment needs of major metropolitan areas and larger communities. As a result, the wastewater collection and treatment facility with which we are most familiar is conventional gravity sewers conveying wastewater to a mechanical publicly-owned treatment works (POTW). With the introduction of indoor plumbing, collection sewers patterned after storm sewers were constructed. However, land application or the use of soil materials (sand filters) were still used for treatment. Many communities in the western U.S. utilized treated wastewater for irrigation. As wastewater flows and land values increased, mechanical plants became a necessity because they did not require large areas with specific site criteria. Today, codes and regulations are written with the "modern" collection and treatment technologies in mind. Traditional training for design engineers largely ignores "low tech" alternatives. It has been only in the last 15 years that alternative technologies have been revived from the past or developed for application in small communities.

Today, several lower cost or more cost-effective options exist that may be applied effectively in small communities and rural areas. These include collection technologies and treatment technologies which provide the equivalent of secondary treatment. Many of the treatment technologies are based on "natural" systems which rely on the assimilative capacity of the natural environment for wastewater treatment and renovation. As such, no one alternative is effective for meeting every need because the characteristics of each community vary. Therefore, the various alternatives represent the "tools" in a toolbox which planners, engineers, operators, local officials and regulatory agency personnel can utilize to address specific wastewater treatment needs and goals.

The town of Stovall and the unincorporated community of Terra Cia in North Carolina illustrate the need for encouraging the use of alternative technologies. They both have a clear the need for wastewater treatment

facilities, but the costs associated with conventional collection and treatment to very stringent water quality standards will preclude construction of facilities in these communities. By utilizing alternative collection, treatment, and wastewater management technologies, however, a cost-effective system could be designed and implemented.

#### Septic Tank System Management

Reducing the extent of sewers needed by decentralizing treatment has a significant impact on facility costs. The most decentralized system is one where each building is served by an individual septic tank system. Properly maintained onsite systems could eliminate the need for central sewerage. It is difficult for some to imagine individual septic tank systems as being a permanent solution when they often are the reason that wastewater facility planning is initiated. However, the reason for the failure of most onsite systems is the lack of effective management, either through inappropriate application of technology or lack of maintenance. Conventional sewerage systems are designed by qualified engineers and operated and maintained by trained personnel. If malfunctions occur, it is the responsibility of these personnel to correct the problem. Septic tank systems, on the other hand, traditionally have been designed based on outdated codes and operated by untrained owners. Professional management rarely is provided.

Septic tank management includes not only the hardware and leach field, but disposal of the residual material (septage) which accumulates in septic tanks and requires periodic removal. New federal guidelines from EPA spell out management standards for all domestic sewage sludge and septage. Unfortunately, many small communities are unaware of the new Part 503 regulations and will not be in compliance when the standards become effective. Even those who do receive information may not be able to meet the requirements of the regulation, which will require expensive testing. Stabilization and conditioning also will be required in order to beneficially reuse septage and sludge.

Septic tank systems do not create the need for public wastewater facilities --

lack of effective management does. Septic tank systems and their alternatives are legitimate wastewater treatment systems. For too long we have considered them "interim" facilities which should be abandoned when sewers arrive. But many communities cannot afford, or are unwilling to pay, the cost of central sewerage. A change in technology may not be the answer if cost-effective facilities are to be constructed. Rather, a change in the level or nature of facility management may be all that is needed. New physical facilities come at a high price; new management operations may not. Effective management (public or private) of onsite facilities could ensure that appropriate alternatives are utilized and that timely and appropriate maintenance is provided.

Stinson Beach, California is located in an environmentally sensitive shellfish area and bird sanctuary. In the late 1970's the community was ordered to stop using septic tanks due to contamination of shellfish beds linked to the septic systems. Plans were drawn to install a conventional wastewater collection and treatment system, but opposition arose to the estimated \$425 per year cost to rate payers. As an alternative, the local water district came up with a plan to institute public management of the septic systems to correct malfunctions and ensure timely maintenance. The plan was implemented, and subsequent water quality monitoring has shown it to be successful. The cost to the 675 homeowners is \$155 per year in user fees and \$96 per year in property taxes, with construction and repair costs paid directly by the owners.

Statewide onsite maintenance programs also exist. In the State of North Carolina, a program was established recently to train and certify operators of onsite systems. All privately owned onsite systems in the state are classified according to the complexity of the system design. Operating permits are required for those systems which utilize a sewage pump, and minimum maintenance inspections are specified for each category. The maintenance must be performed by certified operators. With this program, future failure problems could be prevented, thus avoiding the necessity for central sewerage. To date, 650 individuals have been trained and certified. The program involves the cooperative extension service, state training agencies and certification commission, and relevant regulatory agencies.

### Alternative Sewer Systems

Where individual onsite systems are not feasible because of small lots or difficult site conditions, the wastewater must be collected from each property for treatment at a remote site. Construction costs of conventional gravity sewers, which are designed to permit the wastewater to flow down a sloping pipe under the force of gravity, often are prohibitive in small communities because of excavation and material costs necessary to bury the large diameter pipes with straight alignments and uniform slopes between manholes.

Alternatives to conventional sewers for low density developments have been designed. They differ from conventional sewers by changing the motive force (the force which moves wastewater through the system) and/or the character of the wastewater collected to reduce excavation and pipe costs. The most commonly used alternatives today are pressure, vacuum and small diameter gravity sewers.

Pressure sewers use positive pressure created by small pumps at each connection rather than gravity to convey wastewater through the sewer mains. This method allows the mains to be installed at a constant depth rather than maintaining uniform downhill gradients as required by traditional gravity sewers. By providing pretreatment at the connection to remove trash, grit, and other settleable solids, smaller diameter pipes (2-6 inches) can be used and installed. These pipes can be installed around existing obstructions in the path of the sewer. Small pumps are installed at each connection, usually on the property served, to pump the wastewater into the mains. Grinder pumps often are used because they macerate solids in the wastewater to create a slurry much like that of a kitchen sink disposal, thus preventing clogs in the smaller diameter pipes. Another option is to use septic (or interceptor) tanks, which allow solid material to settle out, and then pump the wastewater into the mains by means of effluent pumps. These systems are known as septic tanks effluent pumping (STEP) pressure sewers.

Vacuum sewers are similar to pressure sewers in that wastewater is conveyed by a difference in pressure rather than by gravity. The vacuum pumps are located

in a central station with vacuum interface valves located at each connection. Raw wastewater, rather than settled wastewater, enters the collection main at the interface valve. Raw wastewater accumulates behind the valve until, after reaching a set volume, the valve opens and the wastewater moves forward, propelled by the difference in atmospheric pressure behind it. The slug of wastewater travels to the next interface valve, where the process repeats itself. In this manner the wastewater reaches a central vacuum station from where it is pumped by mechanical means to a treatment facility.

Small diameter gravity sewers are similar to pressure sewers except that wastewater flows by means of variable or inflective gradients (alternating between downhill and uphill flow) instead of by mechanical pumping. Liquid follows an overall negative gradient from sources to the ultimate treatment facility, or to an interceptor sewer and then to the treatment facility.

Table 1 describes the characteristics of each of these and Figures 1-3 illustrate their construction. Several hundred alternative sewer systems are operating successfully around the U.S., Canada, and Australia with reported cost savings of up to 50% of conventional gravity sewers.

#### Natural Systems for Wastewater Treatment

One major difference between "natural" systems and conventional systems is the reliance on the land to treat and renovate wastewater. Maximizing the use of existing resources in the community can minimize the cost of treatment facilities. One resource that small communities usually have that urban areas do not is land. Utilizing the assimilative capacity of the local environment rather than concentrating the wastewater in a small area and injecting energy through mechanical means will reduce the costs of treatment. Natural systems typically require fewer and less skilled operational staff, consume less energy and produce lower volumes of residuals than do conventional mechanical or aerobic facilities. They also can produce higher quality effluents.

Natural systems utilize either soil or specialized aquatic environments. Soil-based systems include subsurface infiltration (septic tank systems or

cluster systems), slow rate land application (irrigation onto a vegetative surface such as pasture, cropland or forest), rapid infiltration (flooding of shallow basins) and overland flow (sheet irrigation of vegetated slopes). Aquatic systems include stabilization ponds (artificial ponds), floating plant systems and natural or constructed wetland systems. Although these systems have been demonstrated to offer cost-effective treatment in many localities, the application of any one of these is limited by site characteristics and climate. Their application also is limited by the unfamiliarity with alternative technologies of many in the consulting field.

Mayo Peninsula on the shores of the Chesapeake Bay in Anne Arundel County, Maryland is a good example of the use of natural systems for wastewater treatment. This eight square mile area containing 2300 homes is served by a decentralized wastewater facility which includes individual septic tank systems, cluster subsurface infiltration systems and a communal system using artificial and natural wetlands for treatment. This communal system collects septic tank effluent from a large number of homes through pressure sewers which convey the wastewater to a central facility for treatment by sand filtration bulrush/cattail wetland, peat wetland and finally a natural offshore wetland (Figure 4). Through this process, the wastewater is nearly completely reclaimed at a capital cost estimated to be \$12 million less than conventional treatment. In addition, the natural environment is preserved and enhanced.

In the Chowan River Basin of North Carolina, all municipal wastewater discharges to surface waters were eliminated through construction of municipal wastewater irrigation facilities, which applied the treated wastewater to pasture and forest lands. The total costs of the facilities was 25-50% less than conventional treatment and they eliminated all nutrient contributions to the surface waters. The recycling of municipal wastewater through the plant/soil system is an appropriate alternative for these communities. It keeps operating expenses and overall treatment costs reasonable, and helps them comply with the tenets of the Clean Water Act to eliminate the discharge of pollutants.

### Sand Filters

Sand filters are similar to other natural systems in that natural materials and processes are used for wastewater treatment. They consist of beds of medium to coarse sand over which settled wastewater is applied. Biological treatment of the wastewater occurs as the waste percolates through the sand bed. Effluents which exceed secondary treatment standards are achieved with little power consumption and operator attention. Sand filters have a long history of successful performance, but, until recently, they were a technology forgotten as they were abandoned for mechanical plants. Hundreds of small communities and rural schools in the U.S. are now using this technology. Experience has shown them to be trouble-free, providing advanced treatment levels at reasonable construction and operation costs.

### Water Conservation

Reducing the amount of water to be treated is an alternative often overlooked. Until recently, water conservation could not be implemented successfully because of the lack of appropriate plumbing fixtures. Today, however, quality products are available. Ultra-low volume flush toilets have been shown to reduce wastewater flows by 40-70%. Composting toilets eliminate toilet wastes altogether. The remaining wastewater can be recycled for toilet flushing or for irrigation of greenhouse plants. Water conservation is just emerging as a viable solution to wastewater treatment problems and needs further research.

An ongoing study by the Hatteras Water Association in Buxton, North Carolina is finding that water demand can be reduced 20-30% with a water conservation program. This private association is benefitting from demand reduction. Although revenue has declined, reduced demand has enabled the association to meet all of the water needs in its service area.

## **DEVELOPING AND IMPLEMENTING ALTERNATIVE TECHNOLOGIES**

Development of alternative technologies is slow and difficult. No national

program exists currently with a goal to develop effective and affordable wastewater treatment alternatives suitable for small communities. Therefore, the development of new technologies springs largely from individual efforts that often are underfunded and lack adequate peer review.

The 1977 amendments to the Clean Water Act attempted to provide incentives for development of innovative technologies and implementation of proven, but seldom used, alternative technologies. A 10% construction grant bonus was given to portions of projects which included technologies qualifying as innovative or alternative (I/A). The program accepted most of the risk by providing a 100% modification or replacement grant if the technology failed to perform as designed within two years of operation. The majority of these funds were used by the large municipalities because they were perceived to be the largest contributors of pollutants. Because of the small size of their discharges, small communities were not thought to be a good use of I/A funds.

Application of I/A funding allowed the town of Waxhaw, North Carolina to develop an alternative collection and slow rate irrigation system at an average household cost of \$19/month. The cost per household under the original recommendation of the consultant using conventional collection and treatment technology was estimated at \$36/month.

In the 1981 amendments, the funding incentive was increased from 10% to 20% and a small community set aside was established. The set aside obligated rural states to reserve 4% of their construction grant allocation for implementation of alternative technologies in small communities. This I/A program was successful in implementing alternative technologies and raising the awareness of design engineers and the public about the availability of non-conventional technologies for small communities. Unfortunately, the program was terminated with the phasing out of the federal construction grants program in 1990.

Outside of the construction grants program, the U.S. EPA Municipal Environmental Research Laboratory funded research to develop and demonstrate alternative technologies for unsewered areas. These funds were responsible for the development of alternative onsite system designs for use in areas with

soils unsuited for the conventional septic tank system, demonstration of alternative sewer technologies and assessments of several other treatment technologies. However, these funds were eliminated from the budget of U.S. EPA by 1984 and the program staff disbanded. This is most unfortunate when one realizes that approximately 1/3 of the U.S. population lives in unsewered areas.

The lack of funds has made implementation of public wastewater facilities in small communities difficult. First, small communities are suspect of alternative technologies. Often, the alternatives are perceived as "second class" or "experimental." As such, the communities are reluctant to spend their limited funds for design and implementation. Yet, they cannot afford conventional facilities. Another disincentive is that planning and design costs frequently are higher than those for conventional technologies with no guarantee of project success. Further, regulatory agencies and codes lack the flexibility to readily accept unfamiliar technologies, which creates delays and increases design costs.

Small communities are not completely without help. The State Revolving Fund (SRF) loan program, which has replaced the Construction Grants program, provides low-interest loans for wastewater facility construction. The program rules for establishing funding priorities are more flexible than the previous grant program so that assistance can more easily be given to small communities at the state's discretion. The Farmers Home Administration has a low cost loan and grant program for qualifying low income communities. Some states, such as Wisconsin, also provide low cost loans or grants from state funds in hardship cases. The Department of Housing and Urban Development administers the Community Development Block Grant program, which is directed toward low and moderate income communities. These block grants may be used for a variety of projects, including sewer construction. Funding in each of these programs, however, is limited and falls short of actual needs.

Non-monetary assistance also is available. The U.S. EPA Small Flows Clearinghouse is a resource for technical and non-technical information regarding wastewater facilities planning, design, operation and performance in

small communities. U.S. EPA also has published design manuals including "Onsite Wastewater Treatment and Disposal" (1980), "Land Treatment of Municipal Wastewater" (1981), "Municipal Wastewater Stabilization Ponds" (1983), "Constructed Wetlands and Aquatic Plant Systems for Municipal Wastewater Treatment" (1988), "Alternative Wastewater Collection Systems" (1991), and "Wastewater Treatment in Small Communities" (1992).

Additional assistance is available from state cooperative extension services and private, non-profit associations through programs such as the Small Towns Environment Program, sponsored by the Rensselaerville Institute in New York, and the Water Environment Federation's Technology Research and Inquiry Network.

#### HOW FEDERAL AND STATE GOVERNMENTS CAN HELP

##### Outreach

When faced with the need to upgrade their wastewater facilities, many small communities feel helpless. Their first concern is cost. They are not aware of what financial aid programs may be available nor how to utilize them. They are afraid to hire someone to help because that, too, will cost. If they try to pursue a solution on their own, the paperwork can become overwhelming. Further, they are not comfortable with alternative systems because they are perceived as untested or half-way measures. Thus, they often are frightened into inaction.

Better guidance must be given. Programs must be targeted specifically for small communities. Their options and required courses of action must be clearly presented to them at the time they are faced with the issue. Community officials are part-time volunteers that are not always free to attend general informational meetings. Direct communication is needed at the time compliance orders are issued. In many states, this will require close coordination between agencies since septic tank systems are usually regulated by health departments, while water quality issues are regulated by environmental protection departments. In unsewered communities, failing septic tank systems

are usually the cause of the compliance order. Informational brochures should be prepared for inclusion with compliance orders, and agency staff should be made available to meet with officials in their community to describe their options. Local contacts and peer match lists should accompany these orders so as to provide local officials with all necessary information needed for compliance.

### Financial Aid

The resource small communities lack most is money; money to construct the facility and money to manage it. Life cycle management is a critical and costly issue. Financial aid programs are needed if compliance with water quality standards is to be achieved. Financial aid programs traditionally have provided grants to communities for construction, but not operation. There are several examples of wastewater facilities being constructed with grant support that were too costly for the community to operate. Ability to pay for specified technology must be taken into account. The Farmers Home Administration loan program bases any grant amount on the annual income of the community. However, funds are provided only during the construction phase. Though planning and design costs are reimbursable, the community is responsible for these costs until that time. This can be frightening in the absence of a secure funding source.

The State of Wisconsin has established a hardship grant program that is proving to be successful. Communities qualify for a low or no interest loan and/or grant based on the community's ability to pay. The basis of the assessment is the average annual family income and the total assessed value of the property in the community in relation to the estimated user charge for operation and maintenance of the facility. Funds are provided in advance of planning and design to relieve the community of obtaining any commercial loans until project implementation. Such a program may provide a good model for federal or other state programs.

Public funding of community facilities has required that the recipient be a public entity. This has inhibited the privatization of these facilities for

efficiency of administration and operation and for economies of scale. Most small communities do not have the personnel or skills to administer, operate or maintain the facility after construction. Privatization may be an answer. Prior to 1986, privatization was gaining momentum, but the Tax Reform Act created disincentives for privatization. Modifications to tax codes could encourage long term investment in rural infrastructure and reduce the overall cost of government. Changes in funding requirements to allow public/private partnerships need consideration also.

Finally, the paperwork with financial aid programs needs to be reduced. Not only is it overwhelming to the grantee, but it also is overwhelming to the small local contractor. Larger contractors located outside the community, and usually with higher overheads, are the only ones that typically compete for projects receiving grants-in-aid. This adds to the high per capita costs in small communities.

#### Regulatory Agency Flexibility

There are as many as 800 different environmental compliance issues that can apply to small communities. Many of the regulations which deal with these issues were developed primarily for densely developed areas where risks to the environment are significant. However, they are applied uniformly to all communities. Uniform application may not be appropriate. The appropriateness of standards established in water quality regulations in small community settings should be evaluated. If inappropriate, flexibility should be built into the regulations to account for the significance of the potential environmental risks.

Similarly, design guidelines for wastewater facilities were written for urban conditions. Onsite systems are not considered to be a legitimate alternative, sewers are designed for peak flows experienced in metropolitan areas and industrial discharges, and wastewater treatment options do not include non-mechanical alternatives. When facilities are proposed that do not follow the established guidelines, approvals are difficult. Approving agencies need to be more accepting of alternative technologies. Design codes need flexibility.

Regulatory agencies need to be better informed about the technologies so that they are comfortable with them. Cost-effective, "low tech" alternatives need to be better promoted and encouraged. Regulatory agencies cannot, by law, approve facilities which do not meet water quality standards. As they are not comfortable with more cost-effective technologies for small communities and rural areas, inaction can result while water quality continues to be degraded.

Regulatory agencies also must recognize that small communities face a whole host of environmental management mandates, including water quality, solid waste, and drinking water. These mandates compete with each other for the scarce local funds available. Regulatory agency personnel and system managers must work cooperatively to establish realistic time frames for achieving compliance.

#### Research/Demonstration Program

Thirty percent of the U.S. population is unsewered. Thirty percent of all domestic wastewater in the U.S., representing over 3.5 billion gallons per day, is treated by onsite systems, most of which rely on soil and groundwater recharge for treatment and disposal. Yet, no federal funds are directed specifically for studies to develop effective wastewater management in unsewered areas. What research is done is done largely on the local level with little or no knowledge of what others have done or are doing. Much misinformation is developed and propagated. We spend much of our time traveling the same paths, many of them dead ends.

National direction is needed to develop strategies to investigate and develop wastewater technologies for small communities. Research and demonstration funds also are needed. What is acceptable performance? Can conventional technology achieve it and be affordable? Are other alternatives equally effective? What are they and how must they be designed and managed? Are existing environmental protection laws and codes appropriate for small communities? If not, how should they be changed? What is the supporting documentation and rationale for the changes? These are just some of the

questions that need to be answered. Without direction and money, they may not be for some time to come.

Direction and priorities should be developed, implemented, and evaluated through a process involving state and federal environmental and education agencies, cooperative extension services, professional societies, and non-profit associations.

#### CONCLUSION

Small communities face many difficulties in complying with environmental regulations. They have been largely neglected by the regulatory agencies and funding programs of the past, yet they are the poorest in resources. The quality of life, property values and economic growth in these communities are inhibited by the inability to upgrade their facilities. They need help. In closing, I would like to call your attention to four specific areas where I believe we can make a difference in helping small communities meet their wastewater treatment needs.

First, both state and federal regulatory agencies need to take extra effort to help small communities address their wastewater treatment and residual management needs. This includes putting more effort into providing technical and financial assistance, helping community leaders understand what is required of them under environmental laws and regulations, and making internal adjustments which facilitate and encourage the use of innovative and alternative technologies where appropriate.

Second, there needs to be better coordination between the relevant local, state and federal agencies which play a role in addressing small community wastewater needs. With limited financial resources, every dollar must count toward meeting these needs. Duplicative and contradictory efforts must be eliminated. Only through a coordinated and cooperative effort can agencies successfully reach out to small communities and provide them with the assistance they need.

Third, every possible funding option should be made available to help small communities. States should be encouraged to set aside funds through their State Revolving Fund or other mechanisms. Congress must address tax and regulatory disincentives which discourage small communities from obtaining private sector assistance.

Finally, the federal government must take the lead in promoting and facilitating research on wastewater treatment and residual management technologies which can help small communities. The federal government is the only entity with the resources and wherewithal to assess and coordinate research on a large scale. Research needs include new collection system technology, nutrient removal, groundwater impacts of land-based septic systems, and new biological treatment processes. Monitoring of existing sites and extensive data collection and analysis should be a key component of research efforts.

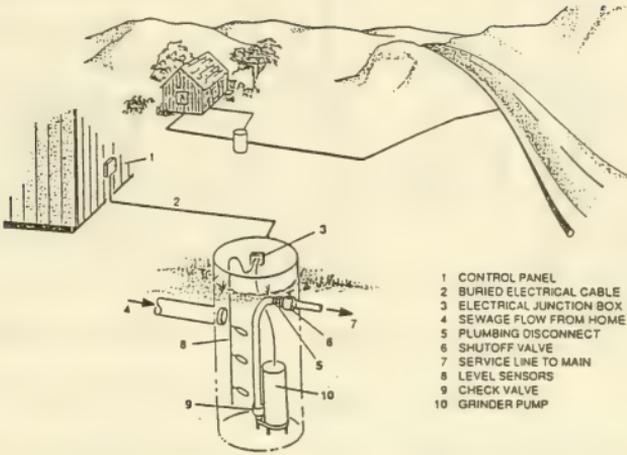

The Water Environment Federation would welcome the opportunity to work with this subcommittee in seeking solutions to the difficult problems small communities face in meeting their wastewater treatment needs.

I appreciate the opportunity to appear before you today, Mr. Chairman. This concludes my testimony.

TABLE 1: Characteristics of Alternative Wastewater Collection Technologies

SYSTEM TYPE	MOTIVE FORCE	WASTE CHARACTER	DESCRIPTION
Low Pressure a. Grinder Pump b. STEP	Positive Pressure  Positive Pressure	Ground raw waste  Septic tank effluent	Pump vaults at each connection store small volumes of wastewater for periodic pumping into small diameter collectors (1-1/4" min) laid at a uniform depth regardless of topography
Vacuum	Negative Pressure	Fresh, oxygenated raw waste	Pneumatic valves at each connection release small quantities of raw waste and air into small diameter vacuum collectors (3" min) laid shallow in a saw tooth pattern
Small Diameter	Gravity	Septic tank effluent	Septic tank effluent drains into small diameter (2" min) collectors laid at variable grade to conform to topography as allowable

(a) Grinder Pump (GP) System

(b) Septic Tank Effluent Pump (STEP) System

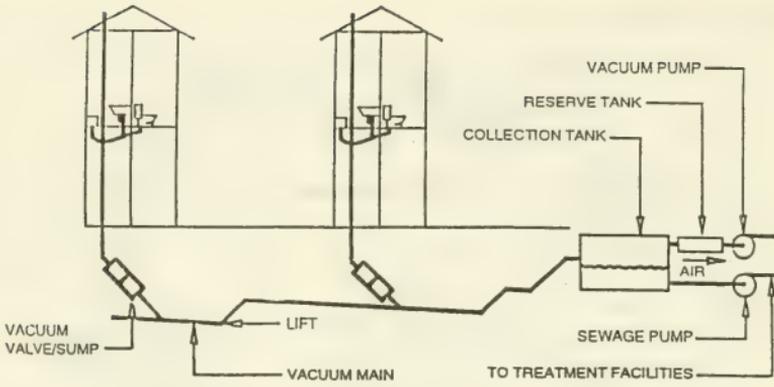

FIGURE 2: Schematic of a Vacuum Sewer System

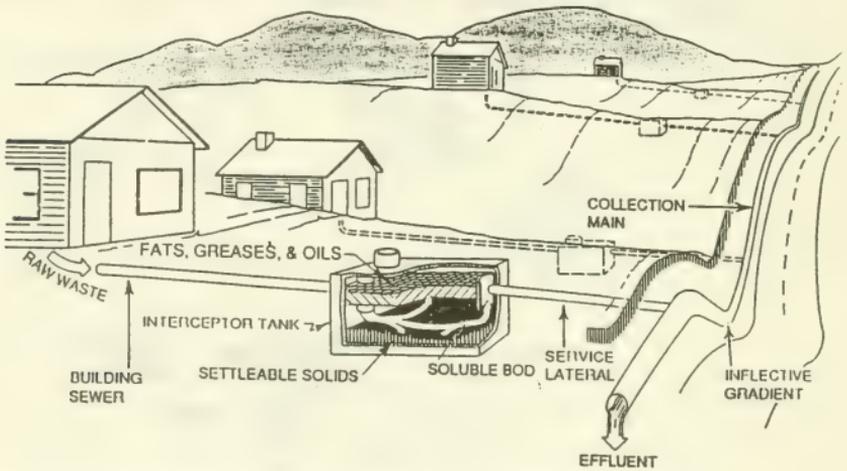

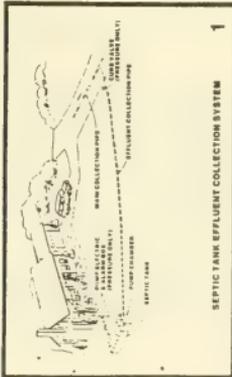

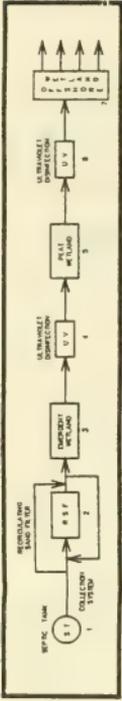

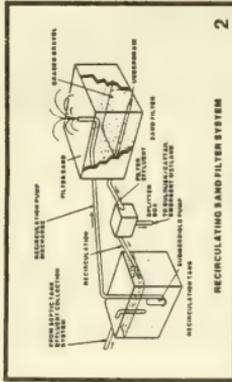

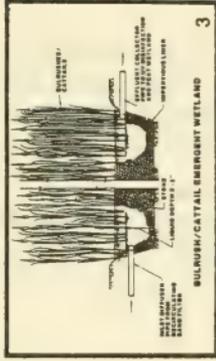

FIGURE 3: Schematic of a Small Diameter Sewer System

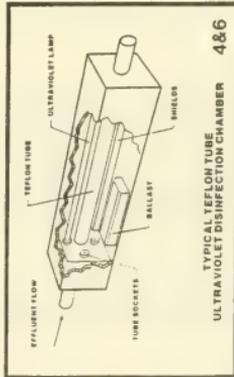

**SEPTIC TANK EFFLUENT COLLECTION SYSTEM** 1  
 Septic Tank Effluent Pump (STEP) system. Each property will include an on-site septic tank for solids removal. Effluent flows by gravity or is pumped to a collection system and conveyed to the treatment plant.

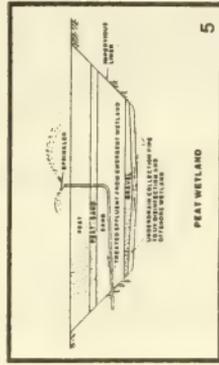

**RECYCLING SAND FILTER SYSTEM** 2  
 Recirculating sand filter. First, the effluent will be evenly distributed over a bed of sand, which purifies wastewater through physical and biological means.

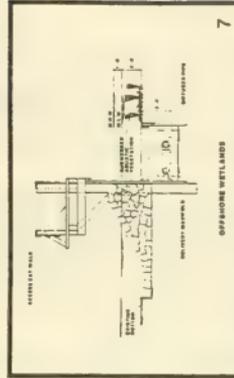

**SULPHUR/CATALYT WETLAND** 3  
 Man-made bulrush/cattail wetlands. Next, the filtered effluent will flow by gravity into man-made freshwater bulrush/cattail wetlands. Here, nitrogen will be removed and suspended solids, and pathogens will be further reduced.

**TYPICAL TEFLO TUBE ULTRAVIOLET DISINFECTION CHAMBER** 4&6  
 Ultraviolet disinfection. Then, the flow will pass through a chamber for ultraviolet disinfection, to eliminate pathogens.

**PEAT WETLAND** 5  
 Man-made peat wetlands. For phosphorus removal, the waste water will be applied to man-made peat wetlands.

**OFFSHORE WETLANDS** 7  
 Offshore wetlands. After final ultraviolet disinfection, the effluent will be pumped into a man-made offshore wetland with submerged aquatic vegetation. Nearby shellfishing and water recreational activities will continue undisturbed.

Statement of

Mr. Joseph Siragusano  
Board Member, Ohio Rural Water Association on behalf of the National  
Rural Water Association

U.S. House of Representatives  
Committee on Public Works and Transportation  
The Subcommittee on Water Resources and Environment  
[sewage treatment needs of rural and small communities]  
Washington, DC

February 23, 1993

Mr. Chairman,

2/23/93

As a board member of the Ohio Rural Water Association and member of the National Rural Water Association, I want to thank you for the opportunity to address the committee today. It is an honor and a privilege to appear before the Public Works subcommittee on Water Resources and the Environment.

First, I would like to this opportunity to introduce myself. My name is Joseph Siragusano and I have been the Director of Sanitary Engineering for the Jefferson County Water and Sewer District in Ohio for 27 years.

I am here on behalf of the National Rural Water Association and its 45 affiliated state rural water associations and their 12,000 member water and wastewater systems. Each state association provides training and on-site technical assistance in solving operational and maintenance problems to rural and small communities, during the course of the year we provide 45,000 on-site types of assistance.

Speaking on behalf of rural America, I would like to express my gratitude for your support and concern for the welfare of the people of rural areas. During my 27 years of employment with the Jefferson County Water and Sewer District, I have encountered many difficulties and hardships placed on the county government's water and wastewater systems, these problems and burdens commonly get passed onto the customers we serve.

I have come here today to express our support for a clean and safe rural environment. A safe environment must include the proper and safe treatment of wastewater.

Sewage treatment in particular is a problem because many small communities lack funds for projects as well as the competition between small and large communities for scarce feederal funding. As you know smaller communities received a disproportionate amount of grant program monies before 1987 and now are solely dependent on the loan funds.

To solve these pollution problems we need a new grant program specifically categorized for small communities rather than all EPA funding

going to revolving loans.

Our area is just one example of a typical rural community. Economically speaking, the area is under great financial stress. Jefferson County is basically a blue-collar work force, primarily supported by the steel industry. At the present time, many of the areas' residents are laid-off from the steel mills as well as other plants and manufacturing companies. Therefore, as numerous studies have indicated the income for rural areas is quite low, and Jefferson County is no exception.

Before I reflect on some, past and current, problems facing my community, I would like to acknowledge the support and concern this Committee has shown in dealing with the sewage problems of rural America. The Rural Water Association and the Ohio Rural Water Association greatly appreciate your consistent dedication to the cause for bettering the health and living conditions of rural residents.

As you know, in 1973 the Clean Water Act was passed by Congress to clean up our rivers and streams of pollution. I would like to briefly comment on my personal experience with past grant programs that were initiated in the 70's as part of the Clean Water Act and continued until 1987.

In order for a community to qualify for the 75% grants, each county, city or village had to do a facility plan study for areas that were in dire need of sewer collection systems or wastewater treatment plants. For example, in Jefferson County approximately 15 facility plans were completed and put on the priority list of the EPA for qualifying for grant monies. Out of the 15 projects, Jefferson County did not qualify for any grant monies.

With all good intentions, the grants did not help many rural areas with pollution problems. Most of the money was received by the large cities and thus eliminating small village and county projects.

After the grant program was phased out in 1987, Jefferson County was notified that our County and Sewer District could not comply with the Clean Water Act's provisions. Soon after this we were referred to the Ohio Attorney General's office for a consent of decree. Also we were informed that a civil penalty was imposed on Jefferson County for not complying with

the NPDES permit. At this time we were instructed by the EPA and the Ohio EPA to bring our plan into compliance within 2 years.

The cost of compliance was extremely costly and no monies were available through the grants, our only available funding was through the Revolving Loans.

The mandate, imposed on us, gave us no other alternative other than to raise the monthly minimum sewer rate on the residents. To meet the EPA and Ohio EPA's requirements on upgrading our wastewater facility plant we had to increase rates 500%. As you well can understand the 500% rate increase was met with extreme outrage by the approximately 2000 homeowners in the community. Many of these homeowners are on fixed incomes and currently are experiencing difficult financial hardships due to the local economy.

This is only one example of rural America not being able to keep up with increasing regulatory burdens. I am certain many similar rural communities have experienced the same difficulties as Jefferson County.

Mr Chairman at this point I would like to mention a few other sewage problems facing rural communities and Jefferson County.

First, for rural areas on-site sewage treatment often does not solve the wastewater problems.

Second, installing new septic tanks and leach fields are not viable for many areas because soils are not suitable for leach field operations.

Third, conditions exist today with actual raw sewage is being run into ditches in some rural areas.

These raw sewage problems often put our children's health in danger. Many rural residents do not have public water supplied to their houses, thus, they rely on well water which can be contaminated from septic systems.

Currently, we have numerous areas that need sewer construction

because of mandates by the Ohio EPA. Without additional federal assistance our estimated minimum cost per user of these projects is between \$80 and \$90 per month. As you can see without additional financial assistance these projects cannot go forward. The only funding available is loans. Obtaining loans does not reduce the construction costs to the point of affordability for our costumers. It is evident that what is a reasonable cost for a large metropolitan (or regional) public sewer system may not be reasonable for a small sewer system which serves relatively few users.

We should also note that in many cases, especially in rural systems, consolidation may not be possible or even desirable because of the distance between communities and homes.

The need for more federal financial assistance grows each years as federal regulations increase the amount of environmental requirements on small wastewater systems.

In closing Mr. Chairman, I would like to reiterate that without the assistance of the federal government the development of new systems and the expansions of existing systems will be very difficult to carry out. Federal regulatory requirements are dramatically increasing the cost of managing rural water and wastewater systems. Small communities have gone to their state governments for help only to be told that only loans funds are available.

I would like to thank all the members of this panel for all your efforts in providing the best possible living standards to rural Americans and urge you to initiate a wastewater grant program for rural America.

On Behalf of the  
**AMERICAN CONSULTING ENGINEERS COUNCIL**

**FEBRUARY 23, 1993**

Mr. Chairman, Members of the Subcommittee on Water Resources and Environment. My name is Paul Sprehe. I am Chairman of PSA Consulting Engineers located in Oklahoma City, Oklahoma. I am a registered professional engineer.

I am also President-Elect of the American Consulting Engineers Council. Thank you very much for the opportunity to present ACEC's thoughts on sewage treatment needs of rural counties and small towns in this country.

ACEC is the nation's largest organization of independent consulting engineering firms, with more than 4,500 member firms representing over 175,000 employees. It's members annually design public and private works projects across the country having a value in excess of \$100 billion dollars. Many of these projects are designed for small towns and communities located throughout rural America by local firms, 80% of which employ 30 persons or less.

There is no doubt as to the urgent need for investment in environmental infrastructure. As you well know, Mr. Chairman, there are countless examples of deteriorating sewage treatment plants and other water facilities throughout this country that need immediate attention. A recent assessment completed by the Environmental Protection Agency (EPA) best illustrates this situation. According to EPA, there are currently 12 billion dollars worth of sewage treatment facilities alone that are needed and "ready to go." Of that twelve billion, Mr. Chairman, over \$136 million worth of projects alone are located within your home state of Ohio. The needs are obviously astronomical, and government must work to coordinate its efforts with the private

sector immediately through partnering efforts if we are to experience a true revitalization in environmental infrastructure. With the obvious backlog in sewage treatment design and construction projects currently "on the shelf", the private sector must be called into action to provide quality design and construction services. While our firms work closely with many federal agencies they strongly oppose competition from agencies that offer free or reduced price engineering services to state and local governments. Many of our firms are still struggling from the recession and are facing competition from the public sector.

ACEC member firms are intimately aware of the needs of small rural communities for sewage treatment development. But rural communities are caught on the horns of a dilemma. There is no argument that the needs exist. However, the technology and affordability of these facilities are beyond the limited means of these small communities to meet their share of capital costs, as well as operation and maintenance costs.

#### TECHNOLOGY INITIATIVES

The choice of technology for wastewater treatment for small communities is a function of many factors. In rural areas, collection and delivery of wastewater from the residences and businesses to the treatment plant is often more costly to design and construct than the treatment plant itself. The reason is that traditional gravity sewers which must be placed in deep trenches over long distances, sometimes up to twenty or thirty feet deep and the necessary pump stations to lift

sewage over ridges and up to the "head-works" of the treatment plant itself. Furthermore, the length of the delivery system often makes it extremely difficult to identify leaks and problems in the system, resulting in increased maintenance costs.

The design of collection systems which can cost-effectively transport smaller volumes of wastewater over longer distances without increasing infiltration and inflow is a challenge to which engineers have responded with technologies such as low pressure and vacuum sewers. Both systems use small diameter plastic pipe which can be installed in shallow trenches and need not be aligned to ensure gravity flow. Since they are sealed to air pressure, these systems do not increase treatment costs by requiring the treatment plant to handle substantial increases in volume during wet weather. Consequently, the treatment choice is not affected by technologies sensitive to peak load or wet weather flows. ACEC members have designed such innovative systems in small communities throughout the country, and I have included detailed examples of some specific projects in my written statement for the record.

The successful completion of such innovative design projects in small communities in different climates and regions of the country demonstrates that wastewater treatment need not be prohibitive in capital or operating costs. Congress must authorize funding for new demonstration projects as a means to illustrate to smaller communities that these systems are extremely cost effective. Currently, many communities, especially those in rural states, are struggling to build needed waste treatment facilities without sharp increases in user charges.

Some simply may be unable to pay for the needed facilities at all. The use of these systems having innovative technologies will not only result in an initial cost savings, but will also save a large amount of money in the maintenance required on the traditional, outdated systems.

#### THE STATE REVOLVING LOAN PROGRAM (SRF)

The state revolving loan program (SRF) has provided one of the largest and lowest-cost sources of public funds available to municipalities to finance wastewater treatment facilities. It is unique in its ability to provide both funding and jobs, with \$5 billion of Federal funds generating up to 350,000 jobs annually according to the EPA. ACEC actively supports the reauthorization of this program by Congress. However, administrative burdens imposed by the Federal government within the SRF program increase facility costs, discourage participation by small cities, delay construction of projects and reduce the ability of states to set their own priorities. These are problems that must be closely examined during the reauthorization process.

ACEC believes that Congress must take a special look at the wastewater treatment needs of small communities and their relationship to the SRF. All too often, small cities and rural towns lack the sophistication needed to participate in the SRF. Many are not able to compile the necessary share of the state funds. Others make the effort to apply for funds too quickly only to discover that excessive Federal requirements make participation in the program undesirable. For example, in the West and Midwest, many small cities are outside metropolitan areas. Yet

to participate in the SRF, they must adhere to federal wage rates under the Davis-Bacon Act. These rates add up to 30% to the cost of a project during construction. As a result, these communities can't afford to do much more than make the most minimal improvements to their systems without Federal assistance. Since large cities generally have higher wage rates and are economically more aggressive, they have been able to claim almost all of the SRF funds.

Small communities could be helped through Administrative remedies such as:

- ◆ easing of Section 201 planning requirements for small cities. Currently, these restrictions on funding collectors and combined sewer overflows hinder project design and construction as well as job creation,
- ◆ simplifying and streamlining the application process, exempting small cities outside of a Standard Metropolitan Statistical Area from Federal regulations such as the Davis-Bacon Act, and
- ◆ allowing small communities to use alternative technologies instead of traditional secondary treatment facilities. Technologies involving constructed wetlands and natural ecosystems can be employed to provide a much higher level of wastewater treatment than currently exists . . . and it can be done at lower capital and operational costs than traditional plants. For example, in 1991, ACEC gave an engineering excellence award to a member firm, CH2M Hill, for the innovative use of a wetland as a secondary treatment in South Carolina.

GRANTS

Last year, EPA provided \$300 million in direct grant assistance to five major coastal cities. We are aware of the pre-existing conditions in those cities and EPA's reasons for applying direct assistance. In fact, some of our member firms helped to design systems to address those wastewater needs. We are concerned, however, that a precedent is being set for the future . . . one that might favor new grants over the SRF. Grant mechanisms are already in place and working within the Farmers Home Administration, the Department of Housing and Urban Development (HUD) and others. We strongly advocate that Congress resist the urge to establish additional grant systems and instead adequately fund the SRF programs.

REBUILD AMERICA COALITION

In closing, Mr. Chairman, I would like to tell you what we've been doing to help solve America's infrastructure problems. ACEC is a founding member of the Rebuild America Coalition which includes 57 public and private organizations committed to the infrastructure challenge. Current Chairman Mayor Maynard Jackson of Atlanta is volunteering his time to help focus public attention on innovative ways to finance the refurbishment of this nation's deteriorating infrastructure. The Rebuild America coalition has proposed a plan for rebuilding our nation that focuses on short-term economic growth stimulus as well as a long term

rehabilitation effort to foster sustained economic growth and productivity improvements for our nation. This plan for rebuilding our nation that has been presented to President Clinton and is also included in my written statement for the record.

Thank you for the opportunity to present testimony on behalf of the American Consulting Engineers Council. We appreciate your recognition, Mr. Chairman, that rural sewage treatment is a necessary public good and a vital element of public trust in government. We would welcome the opportunity to provide assistance and support to you and your subcommittee as you work to ensure that America's future water needs are met. I would be happy to answer any questions.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

(Sewage Treatment Needs of Rural and Small Communities)

---

WEDNESDAY, FEBRUARY 24, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER  
RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC  
WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to recess, at 10:05 a.m., in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. If everybody would take a seat, I welcome all of you to the second of two days of hearings on the sewage treatment needs of small and rural communities.

Yesterday we heard testimony which focused primarily on the national perspective and funding alternatives, such as recreating a grants program and liberalizing the State revolving funds, to encouraging alternative technologies and other things.

Today we are sharpening our focus and looking at this issue from the State and local perspective so as to try to better understand how our actions here in Washington are viewed by the people who have to implement them and live with them.

Following these hearings we will be scheduling further hearings on other issues related to reauthorization of the Clean Water Act.

We have the benefit of an extensive record compiled by last year's subcommittee, under Chairman Henry Nowak, who I would like to compliment because he did a tremendous amount of work that will be of great benefit to us and will eliminate a lot of the unnecessary additional hearings we may have to go through once we have been able to filter through all that Henry and his subcommittee were able to do, and we will hopefully be able to put together a piece of legislation that will be acceptable.

Before we hear our first witness, I am going to recognize my very distinguished colleague and ranking member, Mr. Boehlert.

Mr. BOEHLERT. Thank you, Mr. Chairman. I would like to join you in welcoming everyone to the second day of hearings on the sewage treatment needs of rural and small communities.

Yesterday's hearing laid out the scope of the wastewater treatment problems facing America's small towns, and hopefully today's hearing will lay out what steps need to be taken on the Federal level to address this dilemma.

During the 1970s and 1980s we embarked on the second largest public works program in our Nation's history. In the two decades following enactment of the Clean Water Act, roughly \$75 billion has been spent on constructing wastewater treatment facilities in all of America's major cities. Our success in making more of the Nation's lakes and rivers and streams fishable and swimmable has been quite impressive. This success is even more poignant when one considers the growth our Nation has experienced, both economically and in population.

However, the time has come to readjust the Clean Water Act to meet the challenges of the 1990s. Small communities and nonpoint source pollutants are now by far the greatest source of America's water pollution problems. As I believe today's hearing will demonstrate, the health of large cities is directly linked to the wastewater treatment problems facing rural communities.

As the Congressman representing a substantial portion of the watershed for the New York City water supply, I have seen firsthand how the wastewater treatment of small rural towns can impact the lives of millions of city dwellers. Too often, the wastewater treatment problems of small communities are considered a low priority. We must now realize that the water pollutants discharged in rural areas carry costs for all of us.

Mr. Chairman, I look forward to hearing from this morning's witnesses on what is emerging as one of the greatest environmental and infrastructure challenges of the 1990s, rural wastewater treatment.

Thank you.

Mr. APPLEGATE. Mr. Hayes?

Mr. HAYES. Good morning, Mr. Chairman. I just want to say that yesterday, when Jill Long of Indiana testified, this place was packed with her colleagues, which is a testimony to her competence and her popularity in the House. Today once again, with Mr. Synar, I feel that there is a similar testimony to his popularity in the House and his competence. [Laughter.]

Mr. HAYES. Thank you, Mr. Chairman.

Mr. APPLEGATE. I shall not comment on that.

Anyway, we are very fortunate to have with us a very distinguished colleague. I am very happy to have him here for his very worthy expertise. He is very representative of what it is that we are talking about. He comes from a rural area around Muskogee, Oklahoma, and is the son of a rancher, but he has also been in Congress since 1978 and is one of the most active members of the Committee on Energy and Commerce and the Committee on Government Operations.

Mike has always been one of those people who has never been afraid to take on some of the tough issues; maybe not altogether popular, but he does it with conviction and commitment, so he is very much respected for that.

We are looking forward to hearing what he has to say today.

Mike?

**TESTIMONY OF HON. MIKE SYNAR, A REPRESENTATIVE IN  
CONGRESS FROM OKLAHOMA**

Mr. SYNAR. Thank you, Doug.

First of all, I'm going to regret that I recruited Jimmie Hayes to come on my subcommittee over in Government Operations. I can already see that. [Laughter.]

I will be very brief.

Let me thank you for the opportunity to be here. What I would like to do is outline what I believe are some issues that deserve some scrutiny.

Not only do I represent a rural area, but as chairman of the oversight committee for EPA, I have been intimately involved in a lot of issues, including the Clean Water Act and other environmental statutes, and how they affect rural America.

First, let me say that we need to reinstitute the tailored grant program you heard about yesterday to help small, underfunded communities meet their wastewater needs. The State revolving funds that I think you heard testimony about yesterday have been very successful but, by and large, the rural communities have really been unable to take advantage of the Act's funding assistance because most of the money has gone to larger areas.

According to EPA, almost \$60 billion has been spent since 1956 on construction grants, and only 10 percent of that, or \$6.1 billion went to small communities of under 3,500 residents. Only 20 percent of it went to communities of under 10,000. So you can see that even with the help of the Farmers Home Administration and the USDA's Rural Development Administration, communities are finding that they cannot afford to make needed system improvements.

This funding dilemma has put, as I think you learned yesterday, these communities between a rock and a hard spot. Lack of funds leads to noncompliance with the Act, and that in turn leads to enforcement actions and penalties. Rural areas are really in a Catch-22.

Second, Congress should develop specific provisions to help Indian Tribes comply with the Clean Water Act. We know now that the requirements and the needs of the Tribes are somewhere between \$578 million and \$688 million, according to EPA, and yet a 1989 EPA report found that only \$25 million had been spent on Clean Water Act assistance to Native Americans.

Third, Congress should realign its funding priorities to more accurately reflect the risk to the public. For example, little, if any, money has gone to assuring that the Nation's drinking water infrastructure is sound. I think it's time that we rethink that, and also rethink where we put our money. It is clear that States and systems need more flexibility so that they can perform the job which we've asked them to do.

Finally, I think we should expand the Clean Water Act's provisions dealing with nonpoint sources of pollution. As you all are aware, nonpoint pollution accounts for about 50 to 60 percent of what enters our waterways, but this area has been largely unregulated for the last 20 years.

The agriculture sector is the major source of nonpoint pollution. I think that all of us who have been in Congress for any length of time know that we've been avoiding this subject for a long time. However, I think a recent poll gives us a reason to think we can do this now. According to a Gallup Poll conducted for the Sandoz Co., 92 percent of U.S. farmers say they are likely to use safer pes-

ticides in the future, and 71 percent say they are likely to use fewer pesticides. Farmers really want one thing, and that is adequate and reliable information on the kinds of practices that will protect their water and save them money. I think those poll numbers indicate that farmers will respond and they will help us accomplish the task that we all have.

Again, thank you for the opportunity to be here this morning. I think these are excellent hearings on a subject that obviously is dear to the heart of many people, not only in the Congress but throughout the country.

Mr. APPLGATE. Thank you, Mike. I appreciate your statement and what you have to say, and I think you have really helped to set the tone. You have zeroed in on some very key problems that we have.

Let me ask, there has been talk of a risk to the public health and environment of the various pollution problems; and you, of course, are chairman of the very key subcommittee that has oversight jurisdiction over the EPA. How would you rate the environmental risk of the failure of small communities to meet the Clean Water Act requirements?

Mr. SYNAR. Well, I think that under the present rules and regulations we're going to find that most communities can't meet the standards in regulations that we've set. Is that a risk to public health? The answer to that is no, and that is exactly why we have to rework the way we approach rural communities with respect to this issue.

For example, in the Safe Drinking Water Act arena we are going to have to look at what the most likely contaminants in a water system are and say that those are the ones that we should be particularly interested in, and not ask some small community of 10,000 or less—or 3,500 or less—to try to run a water system the size of Chicago when they don't have the expertise or the people necessary to do the extremely detailed and complex sampling and monitoring that the act requires.

Similarly with the Clean Water Act we have to have a reality check here that once you get outside of the small communities of, let's say, 5,000 and up, that we lack the resources, the talent, and the expertise necessary to do it, and that all of us who believe that clean water and safe drinking water are critical and should be a priority also realize that we don't have to run systems the size of Chicago to ensure that to the public.

Mr. APPLGATE. Do you agree that alternatives—do you think that going back to the utilization of septic tank systems and all is a direction by which we could go to help rural areas?

Mr. SYNAR. Yes. The answer is yes, and clearly less costly alternatives that still ensure protection of public health and the environment have to be used if we're going to ensure that we have clean water.

Mr. APPLGATE. I know that in my area—and I have the same problem; I have a very rural area, and a lot of those septic systems just are not good. What do you think the problem is with that kind of a system today? How can it be improved?

Mr. SYNAR. First of all, giving the necessary monies down to the local community to upgrade the systems, particularly in the infrastructure area. That would be first.

Secondly, putting the goals down to a level that could be achieved. When we are trying to make small communities do everything without the necessary resources, they throw up their hands in frustration and do nothing. If we get our scope to where we really know what we can accomplish, then I think communities will embrace these types of things and take steps to accomplish reachable goals. We can upgrade systems and avoid problems that we have faced in the past with antiquated systems.

Mr. APPLGATE. I know the Chairman was here yesterday and talked about the technology that is being achieved today to find out the amount of pollution and what can be removed, the measuring aspect of it, like so many parts per million, then it gets into billion, then a hundred billion, and who knows, maybe so many parts per trillion, and the technology just simply isn't able to keep up with it. But that's what we measure everything by. It's becoming almost impossible for us to be able to achieve those reductions. If we're getting down to so many parts per trillion, I don't know where we're going to get the money to put in the kind of technology—or even gain the technology—to achieve that kind of a measure.

So anyway, that's just something I would throw in. I think it's very important.

Mr. Boehlert?

Mr. BOEHLERT. Thank you, Mr. Chairman.

Before anything, Mr. Hoekstra is here and he has a statement that he would like inserted into the record.

Mr. APPLGATE. Without objection.

[Mr. Hoekstra's prepared statement follows:]

February 24, 1993

STATEMENT BY CONGRESSMAN PETE HOEKSTRA (R-MI)  
FOR HEARING ON SEWAGE TREATMENT NEEDS OF SMALL  
COMMUNITIES BEFORE PUBLIC WORKS AND TRANSPORTATION  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT

Thank you Chairman Applegate and Ranking Member Boelherth for focusing our attention on the sewage treatment needs of rural and small communities. As we prepare to reauthorize the Clean Water Act in the days ahead, it is important to determine how well the existing water law is working, what changes in the law should be made, and what role the federal government should play in providing funding for wastewater treatment projects.

In preparation for this hearing, I talked to local officials from a number of small communities in my district regarding their sewage treatment needs. While each community has specific, individual needs and concerns, all agree that financing water treatment projects presents the biggest problem for them. Undeniably, wastewater treatment improvements require substantial capital investment. Without federal grant funds or low-cost loans, small, rural communities cannot afford to implement the programs necessary to comply with the Clean Water Act.

Local officials from the Grand Haven-Spring Lake Sewer Authority, as well as Manistee, Ottawa and Muskegon Counties, have emphasized the need for a long-term wastewater treatment plan, based on what is environmentally achievable and sustainable, rather than what is technologically possible. Constantly

changing regulations and standards create a heavy economic burden for smaller communities. For example, one local official expressed concern about costly sewer separation projects and strategies to stop pollution caused by overflows from sewer systems. According to the official, in the next decade, his community will have spent over 10 million dollars to separate its sewer system. The official is concerned that once the system is separated, the federal government will impose new regulations requiring the treatment of all storm water runoff. These new regulations could require the community to spend millions of dollars to recombine the sewer system with the wastewater treatment facility. Long-term planning could minimize or eliminate problems like this in the future.

Local officials also have expressed the need for more flexible and regionally based guidelines, rather than a uniform national standard, when designing CSO control and other wastewater treatment strategies. Greater flexibility for small communities would help reduce some of the costs of compliance with the Clean Water Act and would provide for regulations that meet the specific needs of each region. Additionally, state and local officials have requested increased funding for the Clean Water Act's State Revolving Loan Fund (SRF). In a recent letter to President Clinton, Governor Engler noted that Michigan could readily use \$141 million in additional SRF funds for 1993 and 1994. Programs like the SRF are essential to the preservation of the Great Lakes and Michigan waterways.

I look forward to hearing the witnesses' testimony and to learning how we can better assist small, rural communities to meet their wastewater treatment needs. I also respectfully request permission to insert statements from local officials in my district into the hearing record. Thank you, Mr. Chairman.

Re: Statement By Mr. James Szejda, Supervising Sanitarian,  
for Hearing on Sewage Treatment Needs of Smaller  
Communities-House Subcommittee on Water Resources

Thank you for the opportunity to provide input into this very important issue. I consider it an honor to be selected to provide these comments.

Many small communities in relatively rural areas do not have access to municipal sewer and/or water service. The homes and smaller businesses which make up the structure of these communities must depend on on site septic systems and wells therefore, for their sewage disposal and water supply needs. Because many of these communities were constructed long before sanitary and well codes were in existence the soils and water supplies they must utilize for these septic and water supply systems may be far from acceptable under present standards. In many instances, the sewage from these structures was purposely directed to storm drains and ditches to carry the problem away from the immediate community. Therein lies the problem that must be dealt with today. In many of these communities the smaller sized lots and the heavy clay soils will not support a conventional septic system and a failing system or a system previously directed to a storm drain/roadside ditch cannot be corrected on site. This situation then presents a severe problem should a complaint be lodged against the offending homeowner or should the homeowner wish to sell this structure. For example:

1. Community "A" was constructed in the early 1900's on heavy clay soils as a farming community. Because of the lack of sanitary codes, the sewage from the community was directed to the storm drains and delivered to a nearby wetlands area

Karen Block  
Page 2

2. Later, Ottawa County created a County Wide Sanitary Code which made this practice illegal. Open disposal of sewage is a very dangerous practice.
3. For the purpose of protecting the public health, this sanitary code contains a clause which requires all structures to be evaluated (septic and water supply) prior to sale. This evaluation serves to advise all purchasers of the condition of these systems prior to transfer of ownership as well as attempt to ensure correction of problem systems prior to sale. Also the majority of loan institutions voluntarily will not allow funding to be transferred without ensuring that these systems are acceptable.
4. A request is received to evaluate a home in Community "A" and the sewage system is found to be drained to the storm drainage system and subsequently to an area of wetlands located north of the community. A review of the lot indicates that on site correction is impossible because of the unacceptable soils or well isolation requirements. The county health department sanitarian must disapprove the system therefore, and the homeowner is not able to sell his home because the purchasers lending institution will not provide financing.

At this point the homeowner and perhaps other homeowners in the community turn to the township to ascertain what can be done to correct the problem. The township will then attempt to determine if there is sufficient interest to pursue correction of the problem on a community wide basis. If so, a consultant is usually retained to develop an engineering plan for a small community sewage system and to determine if some type of funding is available to provide assistance. If federal grants or low interest loans are available, the problem usually can be corrected, if not, the problem will continue to exist causing severe hardship to the residents as well as continue to pollute the wetlands.

My recommendation therefore, is to continue to provide some type of financial assistance to communities in this type of need. The public health as well as the wetlands in this particular situation would benefit greatly by this funding.

Karen Block  
Page 3

This particular situation that I have defined by example above, does exist. The community is Conklin, Michigan and this funding would not only provide assistance to this community but also to the residents surrounding Crockery Lake.

Again, thank you for the opportunity to express my opinion on this matter. If I can be of any additional assistance, please do not hesitate to contact me.

Very truly yours,

*James J. Szejda, R.S.*

WRITTEN TESTIMONY

BY

K. BEN BIPOSS, CITY MANAGER  
CITY OF MANISTEE, MICHIGAN

FOR

THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT

FEBRUARY 24, 1993

Attainment of established standards for the discharge of effluent from the City's Wastewater Treatment Plant has and will continue to represent the largest capital cost ever confronted by the City of Manistee; eclipsing the cost of building an Industrial Park, a municipal lift bridge, public facilities, roads, etc. by a factor of five or ten to one, depending on various cost estimates.

While hundreds of pages can and have been written on this subject, I wish to make only two points.

1. Effluent limits and environmental standards must be established based on what is "environmentally sustainable"; not on what is technologically possible. An overly simplified example: It is technologically possible to produce effluent the quality of distilled water but distilled water lacks the life giving nutrients and elements required by the environment. Do we adversely affect the environment by reducing effluent standards to a level below that which naturally exists in the environment? Even if the answer is no (a gross assumption based on the current level of knowledge), what benefit is achieved at the cost of additional billions of public dollars by attaining that level?

February 22, 1993

Page 2

2. Environmental standards and goals must be long-term, measured in decades and centuries, not elections. A significant factor in municipal reluctance to undertake the enormous capital expenditures required by the federal government relates to the almost certain knowledge that a significant portion of that expense is in vain as the standards will change prior to compliance. What was done will need to be redone or undone when the rules change, billions of public dollars having been needlessly spent.

While the issues are incredibly complex, and while much science is needed to understand the interrelationships of man and the environment, the issues are too important to leave to the scientists. Like generals, scientists must be permitted to fight the battles but Congress must select the wars.

Respectfully submitted,

R. Ben Bifoss, City Manager

RBB:cf

Mr. BOEHLERT. I would like to thank our colleague very much for testifying. It's good testimony and I appreciate that.

Yesterday we heard a mind-boggling story from one witness who pointed out that the construction costs for a wastewater treatment project in one jurisdiction exceeded the total assessed evaluation of all the property within the jurisdiction, which points up the problems that small rural communities are facing.

One of the things that I am concerned about, and your statement indicates that you are too, is that not enough money is going to the small rural communities, so I would assume that you would be in favor of a setaside of a certain percentage that would be earmarked for small and rural communities. My question is, where would the cutoff be? Would it be 10,000 or less? Or 5,000 or less? Where do you think we should do that?

Mr. SYNAR. I'm not sure we need to make that distinction. I think you can define "rural" as 10,000 or less, but I think that we can't forget that the under 3,500 population communities probably have more problems than the 10,000, because at 10,000 they probably have at least some semi-structure of a water program and department there.

So I'm not sure you have to draw that distinction. I think we know where rural America is. The numbers are so skewed that any kind of massaging of them improves the chances for rural areas. That's why the grant program is so critical, because the State revolving funds have done an excellent job and have been very successful. It's just that underfunded rural communities haven't been able to compete for them. That's why a grant program gives those rural communities an opportunity to not only go to the revolving fund, but get the direct grants also.

Mr. BOEHLERT. Well, the other thing, when we're sticking to the revolving fund, in many instances the payback period is too short a time for the communities to handle. So instead of 20 years, would you be receptive to, say, a 30- or 40-year payback period?

Mr. SYNAR. Absolutely. One of the biggest problems we have is bonding, whether or not they have a tax base to do it.

I think the key word here is flexibility—by the regulators, by the EPA, by the Congress—recognizing the difference between rural and urban areas.

Mr. BOEHLERT. Thank you very much. That's the same thing we heard yesterday. The key word is flexibility. We really appreciate your testimony.

Mr. APPLGATE. Mr. Hayes?

Mr. HAYES. Thanks.

Mike, yesterday I filed a bill that deals with grants, and not under Title II or VI of the reauthorization. It's H.R. 1033, and in furtherance of your subcommittee activities I would appreciate it if you would take a look at it. You will see that it is intended to assist rural communities in solving their wastewater treatment needs without imposing unnecessary burdensome regulations.

But I want to ask you a general question. Is it your impression that we could in fact craft a regulatory scheme that differentiates between the burden placed upon urban and rural America to comply with the concept of clean water?

Mr. SYNAR. The answer is absolutely yes. It's really the answer to what I think these hearings are trying to address themselves to. Let me tell you how I've proposed to do it. This approach may be helpful for clean water issues under the Safe Drinking Water Act.

First of all, we find out what are the high risk areas or pollution sources for a community, either because the area has certain industrial activities going on, or certain kinds of agricultural activities that would put them on an alert for certain pollutants, and say that those sources are exactly what we need to target.

Secondly, we don't need to have the kinds of constant and very detailed testing that you would normally have in a big city system; we could do better scheduling. And if we could limit the scope of what communities are trying to look for with the planning on the front end, then the responsibility and the burden is more manageable.

Third, we need to recognize that like in the State of Oklahoma, where I come from, there is one circuit rider for the entire State, which is one of the ten largest geographical States in the country, to serve all the rural areas to help them get the advice and technical expertise, etc. There is no humanly way possible that our rural communities can get up to speed on all the things that are required with just one circuit rider.

As we learned in hearings we had last year in my own district, it's not that there is an opposition at the local level to trying to provide for safe and clean water. Rural communities just want to know how they are supposed to do it, since they don't have anybody on board. When we talk about communities, there is usually no one in a city council or no one working for the city government in a town of 10,000 or less who has the kind of background that we would demand under these rules and regulations. So good planning up front of what we should be worried about, and getting the scope of effort down to where communities can manage it with the talent they have, not on such a persistent and everyday type basis, is really what we ought to try to achieve.

I will look at H.R. 1033. I think it is probably the approach that I have been thinking about for a long time.

Mr. HAYES. The second thing that I would ask, we also have a problem—I'm not sure how you legislate it, but we've got to recognize and prepare for it in clean water—of conflicting mandates. For example, I have communities currently under a mandate from EPA to improve sewage treatment, and under a mandate not to use any site they can think of to do it because it violates section 404 of the Clean Water Act. We've got to find a way to reconcile conflicting mandates because we're making not just a burden, but we're making an impossible condition exist that I don't think could justify the statement that that improved our environment or accomplished any environmental good. The community is already there, it already exists, it already has sewage. It's not going to simply disappear and go away; it's simply going to be in noncompliance. I think we have to have a mechanism by which a small community, which doesn't have a battery of lawyers and isn't a major corporation, to deal with agencies of the Federal Government, can have a simplistic mechanism just to get a resolution of these conflicts, and then go forward in either way they have been directed to go, but

not maintain a box where they are ending up being fined for an impossible circumstance.

Mr. SYNAR. The patchwork of environmental laws that we've put together over the last 25 years have made it impossible for a community not to violate one act while complying with another.

Mr. HAYES. That's right.

Mr. SYNAR. Hope and help are on the way; first of all, with the new creation and structure that the White House has with its Environmental Policy Office, where they can go across lines of agencies, whether it's USDA, EPA, or whatever department is in charge, to bring those together and look at across the board solutions. That's probably one of the major steps that has been taken to improve the chances of that not happening again.

Secondly, EPA Administrator Carol Browner, who I've had a chance to visit with, is absolutely convinced that one of her roles as we move forward in the environmental arena is to bring all these acts together and see what the contradictory natures of them are.

Finally, let's not kid ourselves. With legislation elevating the EPA to a cabinet-level position, there may be opportunities for us to suggest, either through studies or even in the structure of the Department itself, how to avoid these problems in the future. We shouldn't miss that opportunity, potentially, with the EPA cabinet-level legislation that will move through Government Operations, where you serve, to direct some of this.

Mr. HAYES. Well, I appreciate that.

I will make one final observation. I know we are short on time.

That is the observation concerning your point on nonpoint source pollution. I think it is absolutely correct that the farm community, for example, has been frightened of the issue; not because they're not willing to do something, but because they believe they will be handed either a totally unexpected or a totally unachievable burden. I think if we laid the groundwork through your subcommittee and through this subcommittee, we could find that we get a great deal of agricultural assistance on a well thought out program, because I think that the survey that you mentioned in your testimony is correct. Secondly, we might offer them this possibility. I think it's time to quit importing agricultural products that don't meet the mandates that we place upon our farm community, too. I think it's absolutely crucial to their support to say, "Here's the deal. You're not going to use a pesticide, and, guess what? Neither is the country sending it to the supermarket." I think that's a deal that they're more than willing to make, as well.

Thank you very much for appearing.

Mr. SYNAR. As you know, our subcommittee, which you now serve on, has been in the forefront of the "circle of poison" debate, and I absolutely agree that our farmers should not be put at a competitive disadvantage by having products shipped in here with pesticides and fertilizers which we do not allow on our own produce.

Mr. APPLEGATE. Thank you very much, Mike. I appreciate your being before the committee. I think the message is quite clear as to what we heard all day yesterday and from you so far today. I think that is the direction that the committee needs to take, and I think it's the direction the Congress needs to take to help these

small and rural communities meet the mandates that have been placed upon them, and to fulfill what they, too, consider is a responsibility, and that's cleaning the environment.

Mr. SYNAR. Thank you, Doug.

I would ask unanimous consent that my entire statement be made a part of the record.

Mr. APPLEGATE. Without objection, it shall be.

[Mr. Synar's prepared statement follows:]

STATEMENT OF REP. MIKE SYNAR (D-OKLA.) BEFORE THE  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
February 24, 1993

Mr. Chairman, thank you for giving me the opportunity to express my views on the impact of the 1987 Clean Water Act Amendments on small and rural communities. As you know, I represent a largely rural district in northeast Oklahoma. And, as Chairman of the Subcommittee on Environment, Energy and Natural Resources with oversight of EPA and its programs, I know all too well the many frustrations of small and rural communities with great needs but few, if any, resources available to meet those needs. I would like to outline a few issues that I believe deserve increased scrutiny as this Congress tries to assist these troubled areas and begin reauthorization of the Act.

First, Congress should consider reinstating a tailored grant program to help small, underfunded communities meet their wastewater treatment needs. In the 1987 Clean Water Act Congress phased out wastewater treatment construction grants and instead provided federal seed money for the State Revolving Loan Funds. Early accounts indicate that the State Revolving Loan Funds have been very successful and, indeed, should be expanded so that more communities can make needed investments in wastewater and sewage treatment.

But, by and large, small and rural communities have been unable to take advantage of the Act's funding assistance because most of the money is going to larger areas. According to EPA, of the almost \$60 billion spent since 1956 on construction grants, only 10%, or \$6.1 billion, went to small communities of under 3,500 residents. Only 20% went to communities of under 10,000. Even with the added funding assistance provided to small and rural areas by the Farmer's Home Administration and USDA's Rural Development Administration, communities still can't afford to make needed system improvements.

The 1987 Act's phase-out of grants has put small communities in an even bigger bind. They don't have the resource base to pay back the loans taken for upgrading their systems. Banks won't lend these communities the money, and the municipalities are either unable to issue bonds or don't have a sufficient tax base to pay for the improvements even with bonds.

Worse still, this funding dilemma has put many communities between a rock and a hard place: lack of funds leads to non-compliance with the Act, which in turn leads to enforcement actions and penalties. Placing small communities in this "Catch-22" and then saying that problems will be solved with enhanced enforcement is simplistic and unfair. I suggest that Congress seriously consider re-instituting a limited grant or tailored set-aside program for these small underfunded systems. Otherwise, we may leave them eternally in this Catch-22.

Second, Congress should develop specific provisions to help Indian Tribes comply with the Clean Water Act's requirements. The wastewater treatment needs of Native Americans are tremendous, and up to now their situation has been largely ignored. For example, a 1990 EPA report noted that somewhere between \$578 and \$688 million would be required to address Tribal wastewater treatment needs. Yet, a 1989 EPA report found that only \$25 million had been spent to help the Tribes and the Alaska Native Villages build wastewater treatment plants. The Tribes face problems similar to those of small communities because they too lack the resources necessary for repaying loans. I urge the Committee to include specific provisions to assist Native Americans in ensuring their water is clean. Enabling small, rural and Native American systems to construct needed wastewater treatment plants would have a direct and beneficial impact on jobs and the economy and would benefit the environment.

Third, Congress should realign its funding priorities to more accurately reflect risk to the public. For example, EPA rates drinking water as one of its top five exposure risks. And, although \$60 billion has been spent upgrading this Nation's wastewater treatment infrastructure, little -- if any -- money has gone to ensuring that the drinking water infrastructure is sound. More and more evidence indicates that in many areas, old lead service lines are causing serious contamination problems and health risks to our children. And too many people rely on untested, minimally treated well-water for their drinking water needs.

Small and rural communities, especially, feel the lack of investment in our drinking water infrastructure. In 1990, representatives from the U.S. General Accounting Office (GAO) reported to my Subcommittee that the vast majority of systems in non-compliance with the Safe Drinking Water Act were small underfunded communities. These smaller communities, and their citizens, are struggling to meet the much more stringent monitoring and testing requirements of the 1986 SDWA amendments. But they tell me they would rather spend that money on needed capital improvements for their systems than on unnecessary testing for contaminants that they are unlikely to find.

I agree with them that improving infrastructure is a better investment of their very limited resources. So I plan to reintroduce legislation in the Energy and Commerce Committee to assist with some of these problems. They are right about one thing: we have not sought to invest in America's deteriorating drinking water infrastructure and it is time to re-think where to put our money. States and water systems need more flexibility to tailor their compliance efforts to address the real and most pressing threats to their water supplies and to make the best use of their scarce financial resources.

Finally, Congress should expand the Clean Water Act's provisions dealing with non-point sources of pollution. Non-point source pollution accounts for 50-60% of what enters our waterways, but it remains largely unregulated after 20 years. While we have made good progress in reducing pollution from specific point sources, the non-point source pollution problem has grown significantly. The agricultural sector is a major source of non-point pollution. Urban centers also have significant non-point pollution stemming from problems like stormwater runoff and combined sewer overflows.

This is not an easy issue to deal with, and Congress has been avoiding it for some time. But it is clear that the issue is now ripe for consideration. A recent poll conducted by the Gallop Organization for Sandoz Agro, an agricultural chemical company, found that U.S. farmers see water quality as the most serious environmental problem they face. The poll found that 92% of U.S. farmers are likely to use safer pesticides in the future, and 71% are likely to use fewer pesticides. These numbers bear out what I have been saying for a long time: if you provide farmers with adequate and reliable information on the kinds of practices that will protect their water and save them money, they will listen and respond.

In my view, the key to cleaning up non-point pollution is use of market-based strategies and not relying solely on command and control regulation. Better coordination within EPA and between EPA and other Federal entities with jurisdiction over non-point source pollution, such as USDA, is critical. Our farmers and cities need technical expertise and guidance from the government. A more focused Federal effort on the non-point problems facing rural communities could result in significant progress without requiring substantial additional resources. Congress and the various interests must work together constructively in addressing this unavoidable issue.

Mr. Chairman, thank you again. I offer my assistance in addressing these important problems and I look forward to working with the Committee as it reauthorizes the Clean Water Act.

Mr. APPELEGATE. At this point I would like to call up the first panel. If you would, please, come up and take a seat at the table:

Greg Smith, Chief of Environment and Financial Assistance, Ohio Environmental Protection Administration; Robbie Savage, Executive Director, Association of State and Interstate Water Pollution Control Administrators; Keith Porter, Director of the New York State Water Resources Institute; and Dale Givens, Assistant Secretary, Office of Water Resources, Louisiana Department of Environmental Quality.

I think we will begin by hearing Ms. Savage.

**TESTIMONY OF ROBERTA SAVAGE, EXECUTIVE DIRECTOR, ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS; GREGORY SMITH, CHIEF, ENVIRONMENT AND FINANCIAL ASSISTANCE, OHIO ENVIRONMENTAL PROTECTION ADMINISTRATION; KEITH S. PORTER, DIRECTOR, NEW YORK STATE WATER RESOURCES INSTITUTE; AND J. DALE GIVENS, ASSISTANT SECRETARY, OFFICE OF WATER RESOURCES, LOUISIANA DEPARTMENT OF ENVIRONMENTAL QUALITY**

Ms. SAVAGE. Thank you, Mr. Chairman, and congratulations on your appointment to the subcommittee. We in the States look forward to having the opportunity to work with you and the new leadership of this subcommittee.

My name is Robbie Savage. I'm the Executive Director and Secretary and Treasurer of the Association of State and Interstate Water Pollution Control Administrators. I would like to thank you very much for including us in this testimony this morning. Since I have had the opportunity to work with your fine staff since 1979, Mr. Chairman, I would like to thank you and your staff for including us. They're an excellent bunch to work with, and I thank you very much for allowing us to be here.

As you are well aware from the passage of the 1987 amendments, the State revolving loan fund was created to supplement the program that was being eliminated by the Reagan Administration. In a meeting with Mr. Stockman very early on in that Administration, he indicated to us that we had better look for an option to the grants program. Within the context of the Reagan Administration he intended to kill the construction grants program.

The States then worked with this committee and subcommittee, as well as the Senate, to look for options to supplement the grants program and provide funding for the Clean Water Act. Particularly the construction of wastewater treatment facilities. The result of those discussions with this committee and others, was the creation of the State revolving loan funds. We consider that to be a tremendous success, with all 50 States currently managing a State revolving loan fund. This is a tremendous achievement by the 50 States considering the time frame that we had to put this program into place.

It is often suggested that the State revolving loan fund does not adequately or appropriately deal with small communities. We would indicate to you that while that statement can certainly be justified in some instances, the States, through a survey that our association has completed recently, have indicated that they are

currently tracking 17,000 small communities with populations under 5,000. Of those, 49 percent will be requiring some level of construction over the next 10 years. Either for water quality, public health, violations to avoid some kind of litigation, or to achieve secondary or better treatment.

It is also important to note, Mr. Chairman, that 33 percent of the SRF projects are currently in small communities, and that 50 percent of our small communities either have supplemental funding or have received technical assistance from the States to meet their water quality requirements.

We believe that accommodation of small communities is appropriate through legislation, but that any accommodation of such small communities would look not only at their size but also at their fiscal condition, i.e., hardship. There are communities within this country that are small but that are very, very wealthy and do not need assistance from the Congress and from the Federal Government to meet their environmental requirements.

We would also like to use this opportunity to streamline and make more efficient, the SRF program. We would like to use the small communities as our guide and model, the SRF program—if you will, “one stop shopping.” The last thing we need to do in accommodating through SRF our small communities is to make the program any more complicated than it currently is. This would indicate to us that we need to look very closely at the Title II grants requirements. I will emphasize again that the requirements of Title II of the Clean Water Act were instituted for the construction grants program. We’re in a very different mode now, and we need to be looking at eliminating or streamlining a number of those.

We also need to provide funding, technical assistance, and blend principal subsidies with the SRF. In essence, forgiveness of debt in some situations. We also need to provide the States with some flexibility to address the individual needs of our small and hardship communities.

We most definitely need to fund the State revolving loan fund at a \$5 billion level. This was recently presented to the President by the Nation’s governors at their meeting two weeks ago.

We would also suggest elimination of the 20 percent setaside. We thought that was quite a gift back in 1986 and 1987, but that 20 percent setaside restricts flexibility of the governor to fund such projects as combined sewer overflow, stormwater, nonpoint, and others. We also might want to look at a 40-year repayment opportunity, some streamlining of the audit provisions, and a reevaluation of how we apply the innovative alternative technologies. The States met just last week to again reaffirm their opposition to the creation of a new grants program and they are very supportive of the President in his elimination of the construction grants program under his package.

We are very pleased with the context of the stimulus package—obviously, since it begins to address the needs of clean water. It provides us an opportunity to truly evaluate our State revolving loan fund. To make some enhancements, to streamline our program, and make it ever more efficient. We do, however, need to make sure that in that process of evaluation and in taking this opportunity seriously, that we do not make our program more com-

plex. Either for small communities or the base communities out there.

So I would say, Mr. Chairman, that this is a wonderful opportunity to follow through and simplify.

Thank you, sir.

Mr. APPLGATE. Thank you very much for some very excellent testimony.

Ms. SAVAGE. Thank you.

Mr. APPLGATE. We will go to Mr. Smith.

Mr. SMITH. Mr. Chairman, members of the subcommittee, I am Greg Smith. I am Chief of the Division of Environmental and Financial Assistance at the Ohio Environmental Protection Agency, and I appreciate the opportunity to appear before you here today on behalf of the State of Ohio to provide comments about the needs of small towns and rural areas in meeting Clean Water Act requirements. We commend your decision to focus on this important aspect of municipal water pollution control.

It is an important aspect because, although the needs of small communities have been widely recognized, they pose some of the greatest challenges which have been presented by our country's clean water goals. Most importantly, these needs have not been adequately met up to this point by the States or by the Federal Government.

As you receive testimony on this issue, witnesses will present various statistics throughout your hearings to demonstrate that small communities are in need of assistance. I respectfully submit that the challenge before us now is to go beyond the data about small communities and jointly devise substantive strategies which are comprehensive and effective in meeting the interests of those small and rural communities which we serve.

The statistical information that I will present today regarding the need for small community assistance is a summary of the results of a municipal needs survey that was conducted by our agency this past summer. The survey data are a compilation of the needs identified for small community wastewater treatment improvement projects that have been contained in various documents either prepared by small communities or by others for them.

These estimates show a combined construction cost of \$1.1 billion for Ohio communities which have populations under 10,000. I must also point out that since these estimates are derived only from reported construction needs, in all likelihood they underestimate the magnitude of small community construction needs in our State.

The survey information also gives us some indication about the nature of small community wastewater treatment needs. As you can see, most of the facilities improvements that are summarized in the table I have provided are for project types which provide basic levels of wastewater collection and treatment. A relatively small percentage of the costs in each category is devoted to attaining advanced levels of treatment. This observation coincides with our experience, that much of the expense for small community facilities in our State is dedicated to preventing sewage from escaping to the environment, and to providing the most basic levels of treatment. Thus, the most immediate small community needs are not to provide minor increments in pollution removal, but are more

to provide protection of public health and a basic level of quality of life for our small community and rural residents.

Why aren't more of these projects coming forward for financial assistance? Unfortunately for small towns with limited technical and administrative expertise, undertaking almost any wastewater treatment project is an intimidating experience. Also, they know it will be expensive, and in many cases it is not only politically unpopular but it poses a genuine financial hardship to many segments of the community.

These very real limitations inhibit local officials from taking steps to address their treatment needs.

The options available to help them overcome these obstacles are also limited. There currently is no single source of help where small, economically-distressed communities can find the broad range of assistance that they need.

In Ohio, some agencies provide partial funding through grants, but usually the community itself must try to paste together a satisfactory package of grants and loans to make an affordable project, often from three or more different funding sources. These different sources have different requirements; they have different objectives; and they have different application periods. The community is left to assemble, and then preserve, this fragile collage of financing in order to make a project financially feasible.

Most sources of financial assistance do little more than provide funds. Communities receive little guidance on how to help the community develop its project so that it effectively meets the community's needs. Often, small communities need help in identifying appropriate project alternatives which have the right combination of operability and cost-effectiveness for their special circumstances. Also, we find that many community officials appreciate suggestions regarding how to establish user fee systems, sewer use ordinances, and operation and maintenance programs for their facilities.

Beyond financing for affordability, the community's ability to successfully implement these administrative elements will determine whether their system will successfully perform after it is built. Individual guidance and assistance for these items is also very difficult for small communities to obtain.

In Ohio we have attempted to fill these small community needs. We have informal coordination among financing agencies to focus financing resources on a specific number of projects. Our SRF also emphasizes technical and administrative assistance, as well as financial assistance. Within the 18th Congressional District the SRF has made loans to eight communities and has provided various levels of technical assistance to all of those.

But even with these efforts, we believe that the SRFs will continue to be prevented from becoming the full service assistance vehicle that small and rural communities need unless Title VI is comprehensively redesigned. We are therefore proposing that the Congress reconstruct the SRFs to better accomplish the goals of the Clean Water Act and to meet the needs of our client communities. We are calling for a second generation SRF for two reasons. First, the needs of small, economically-distressed communities are not adequately served by the present structure. With the support of Congress the SRFs can do more, and they want to do more, to

make wastewater improvements for small communities of high economic need affordable. If we are to enact a truly community-centered approach to financial assistance, we must have a positive and effective mechanism to do so.

Second, our Governor and our Director have set a standard for the Ohio EPA to be assistive rather than regulatory as a first resort in achieving our mission of protecting the environment. Nowhere is that philosophy better embodied than in our SRF program. We have abandoned the construction grants command and control methods, and now we seek to accomplish water quality objectives through comprehensive community assistance rather than compliance and enforcement.

I believe the SRFs are the best vehicle with which to pursue that philosophy, and that this philosophy is necessary, particularly for our relationship with small, economically-distressed communities. If the Congress can agree on this approach, then we call upon you to empower us as States by giving us adequate mechanisms to do this.

The SRFs must be rebuilt to comprehensively accommodate small communities.

In view of the above, we respectfully set forth the following general recommendations.

First, allow SRFs to provide principal subsidies which can be blended with SRF loans to achieve State-determined levels of project affordability, subject to means tests.

Second, establish specific authority and funding in Title VI for the States to institute outreach programs for small communities to provide technical, administrative, and financial assistance.

And third, in coordination with the States, redesign all project-level requirements and limitations which apply to small community SRF projects so that these requirements are responsive to small community needs first; and then, afterwards as a second priority, to meet only the most compelling Federal interests.

In the interest of time I will defer elaborating on these recommendations, but we will be pleased to provide the subcommittee with a more specific list of recommended changes.

Mr. SMITH. I want to thank you once again for the opportunity to appear here today. The Ohio EPA stands ready to help the committee in any way we can as it continues its deliberations on this issue.

Mr. APPLEGATE. Thank you very much, Mr. Smith.

I will recognize Mr. Givens next.

I would like to say first that your entire statements will be made a part of the record, and that perhaps in trying to help with the time—we may not have all the questions and you may not have all the answers right now, but we may be submitting questions to you at a later time.

Mr. Givens?

Mr. GIVENS. Mr. Chairman, members of the committee, good morning. My name is Dale Givens. I am the Assistant Secretary for the Office of Water Resources of the Louisiana Department of Environmental Quality.

The purpose of my testimony this morning is to explain the problems we face in Louisiana with trying to get rural communities into

compliance with Federal and State environmental regulations concerning sewage treatment.

Improperly treated or untreated discharges of sewage are a significant cause of water pollution and can be a source of human health problems for those who use the water bodies that receive the wastewater. As you are aware, proper treatment and disposal of sewage is required by regulations of the U.S. Environmental Protection Agency. The State of Louisiana also has similar regulations, since we are currently a nondelegated State. While designed to protect human health and the environment, these regulations often result in the need to construct expensive waste treatment systems and supporting infrastructure, such as collection systems to transport the wastewater to the treatment facility. Wastewater treatment needs surveys have indicated the need for facilities and collection systems at a cost in excess of \$1 billion in Louisiana.

Financing projects that require major expenditures of capital can be very difficult for large cities that have a significant tax base. Financing such projects by rural communities that have a very limited tax base can be all but impossible. In addition to tax dollars, funding for these types of projects is usually limited to funds from one of the following: State revolving loan fund, community development block grants, and Farmers Home Administration, which has a loan program and limited grant capability for poor communities.

The SRF loan program is providing critically needed funding to both large cities and smaller cities and towns. However, constraints placed on the program by Federal regulations make it very difficult for some communities, large and small, to obtain funds from this program, such as the Title II requirements, affordability, etc. Many communities simply cannot afford a loan from this program, even though Louisiana has recently established an interest rate of 2.95 percent for these loans to try to make them more attractive.

The CDBG program is often turned to by small and rural communities for funding for wastewater treatment projects. In fiscal years 1992 and 1993, 57 communities applied for CDBG funding for wastewater treatment projects. Only 10 of these were funded, or approximately 18 percent. Currently the program, in Louisiana at least, has a cap of \$750,000 per project.

As more communities attempt to come into compliance with environmental regulations, the demand on this source of funds will increase and the program currently cannot keep up with the needs at the present funding rate.

The Department of Environmental Quality assists the State Division of Administration with the CDBG program by ranking proposed projects each year. To try to make that more practical for the rural communities, factors used in determining the ratings include affordability, enforcement history, and environmental or health impact. In order to attempt to help the smaller communities, this year DEQ modified the factors used to rank the projects and assigned a new factor for affordability with a rating of 1 to 10, with 10 indicating that the community could not afford to implement the project. That factor was then multiplied by .6 to determine the affordability rating, which made it 60 percent of the final rating. The affordability factor was determined by working with the Depart-

ment's Municipal Facilities Division, which administers the SRF program, and using their formulas for determining affordability.

The Farmers Home program, while being a last resort for funding that has rescued many small or rural community waste treatment projects, cannot begin to make up the difference for wastewater treatment projects that cannot obtain funding from either the SRF or the CDBG programs. Clearly, additional funding and funding mechanisms are needed to aid the rural and small communities.

Although not a steady or reliable source of funding, the Department of Environmental Quality's Office of Water Resources has recently begun encouraging companies that are in negotiation concerning an environmental penalty assessment to consider dedicating all or a portion of the settlement amounts towards projects in the local community where the alleged violations occurred. An example of such a settlement agreement is a case where a \$60,000 settlement is being dedicated to a community for the construction of a new lift station to help provide sewage collection for treatment for an unsewered section of the town.

DEQ's Office of Water Resources has entered into a memorandum of understanding with EPA's Region VI concerning enforcement activities, whereby communities that are under compliance orders from EPA for violations concerning wastewater treatment can receive extended compliance schedules if they are planning to fund the project through the SRF program. This is to allow for the extra time required to meet the requirements of that program. Perhaps this same concept could be extended to communities awaiting funding through CDBG or other grant or loan programs.

The sewage treatment needs of Louisiana communities, as is the case with many communities nationwide, is great. The obstacles to funding these projects, particularly with regard to the small or rural community, can be overwhelming. Your assistance in helping to provide a mechanism that includes additional funding and less red tape to qualify for the funding and to construct the projects will be greatly appreciated.

Thank you, sir.

Mr. APPLGATE. Thank you very much, Mr. Givens.

Mr. Porter?

Mr. PORTER. Mr. Chairman and committee members, I thank you for this opportunity. I am Keith Porter, Director of the New York State Water Resources Institute, which is based at Cornell University.

The issue I wish to address is a collision between two acts, and between rural areas and urban areas, by the requirements of the Clean Water Act to rigorously protect watersheds. This inflicts, potentially, very severe economic consequences on the rural communities in those watersheds.

I would like to illustrate what I wish to argue by citing the experience that we're currently having in the New York City watershed region.

The New York City watershed is immense. It extends over an area of approximately 2,000 square miles. It includes eight counties in New York State, about 50 towns, about a dozen villages, and the

watershed itself serves almost 10 million people. So from the water resource point of view, the stakes are enormous.

Under the requirements of the Safe Drinking Water Act, the city is very vigorously pursuing the objective of sustaining very high quality water, which the city, in maintaining its reservoir system in the watershed, can already claim. But the increased requirements of the act result in very stringent pollution prevention requirements. That is where the tension arises between the needs of a major urban area under one act, the Safe Drinking Water Act, and the functioning of small communities in managing sewage treatment plants and wastewater facilities under another act (The Clean Water Act).

Currently New York City has virtually frozen all extensions of existing sewage treatment plants in terms of not allowing further flows or any additional pollutant loadings to be discharged into its system. The consequences of that cap, so to speak, are hard to exaggerate in terms of the economic implications for the communities and the industries upon which those rural communities depend. Basically, they cannot grow. Industries and businesses are unable to operate in that kind of climate. In the watershed now there is a great deal of anxiety which in many communities literally amounts to fear for their economic future.

Unfortunately, in trying to respond to this challenge we are finding ourselves very ill-equipped. Previous speakers have very articulately explained why. Small sewage treatment plants serving small communities are the cinderellas of the sanitary engineering profession. It is very obvious why. In terms of priorities, particularly in States where there are industrial or large urban centers, in terms of priorities those areas are going to receive most of the funding support; hence, small communities are very much at the bottom of the totem pole. But further than that, as illustrated by the New York City experience, where communities in fact perform well today in maintaining high quality water, there is even less priority to help those communities in that the Clean Water Act, historically and traditionally, has been based on the need to remediate water pollution problems. It does not primarily emphasize the need to prevent pollution in the first place. In the case of the Safe Drinking Water Act, that's very much the intent of that act; therefore we have an inconsistency in that some of these small sewage treatment plants now find themselves quite incapable of meeting these new requirements.

I have to differ slightly from the first speaker. Under the Safe Drinking Water Act a major concern is that of parasitic protozoa, which is not well dealt with using conventional water treatment methods, such as chlorination. In the case of one of the protozoa, *Cryptosporidium*, the profession is increasingly lacking in confidence regarding the efficacy of filters. Small sewage treatment plants can be a major source of these protozoa, so very correctly in terms of New York City's objectives under the Safe Drinking Water Act, it looks very askance at very small flows in terms of potentially being sources of these parasites.

All of this raises a very fundamental issue that we increasingly are going to have to face, and that is in our major watersheds throughout the Nation which provide high quality water resources,

we have to tackle the question: to what extent will it be possible for communities and for individuals to live, work, and play in those watersheds? From the traditional water engineering point of view, the historical view, the best watershed is an empty one. Trees are better than people. We submit that that is an untenable position to maintain in the future as the country continues to develop, and it certainly is most untenable in the New York City watershed region.

Hence, how are we going to in fact confront that need?

We suggest that one strategy that perhaps holds the most promise is to look at the problems literally in terms of the watershed scale, to try to address the question, what is the carrying capacity of watersheds relative to the environmental goals that may be in prospect? In the case of New York City, that is obviously dictated by the Safe Drinking Water Act.

Having performed the calculations, which the water profession is quite capable of doing, it is then possible to allocate the permissible loadings on a rational basis; and then within that rational framework, to allow the communities, the industries responsible for sewage treatment plants, to work out what methods would attain the desirable goals. That is a much more sensible and economically sound procedure than just simply capping the flows from the works.

To proceed in this way, however, we still confront the problems that previous speakers have mentioned, namely, the inadequate technical and financial resources of small communities. In the end we still obviously return to that issue. We believe that the way to address it initially, clearly, is to provide technical assistance and training and financial support as possible to these communities.

But further than that, it is very clear from the work we have done with rural communities that there is often intense pride in those communities. We have found it very effective to work through community citizen groups to address the problems and to try and work out the solutions. In fact, such citizen groups are now talking to New York City to submit to the city alternatives to the proposed management program that the city is trying to impose on the watershed.

In other words, under the Clean Water Act the support that act has previously given to public participation, very successfully, we believe should be extended very aggressively to small communities so that they can work out their own future; appealing, in fact, to their very strong sense of local ownership and stewardship.

Finally, the Clean Water Act already in fact does provide for this approach to a limited extent in section 303. We encourage that strategy to be strengthened in the reauthorization of the Clean Water Act so that the watershed strategy can be more systematically and aggressively pursued, particularly in the rural areas that I am describing. If we do this, then we have a reasonable promise of being able to unite environmental and economic interests rather than those interests continuing to meet in conflict.

Mr. APPLEGATE. Thank you very much, Mr. Porter, and to all of the panelists. I appreciate your forthrightness and the way your articulate your positions because they are very good, and they certainly have continued on with the messages that we have heard

since yesterday. I think it's terribly important that we get an idea from people as to the needs that must be met by these small communities in rural America.

It has been pointed out by some of you that, yes, the larger cities—we don't want to get into a wrangle with the larger cities; we've gotten into that before, but they do have a better tax base. I can see, just in my own 18th Congressional District, where the tax base has slowly eroded, and it has taken away or retarded the ability of these small communities to be able to even ask for the money, and then say that they're going to be able to pay it back. All of a sudden you look, and you set this apparatus up and then they say, "Well, it's going to cost you \$50 or \$60 or \$100 a month," and then they say, "We can't give you the loan because you can't afford to pay it back."

I note that in your statement, Robbie Savage, you had mentioned that construction grants per se really didn't work all that well, but that we should be able to try to blend State revolving loan funds with grant monies in targeting those areas with needs; in other words, go back on a needs basis. I think that you were stating something along those lines.

Ms. SAVAGE. For the time that the grants program was initiated, in 1972, we really did not have any other option. As the Clean Water Act was passed—and it was so comprehensive—that to go into a loan program at that time probably would not have been our most effective mechanism. But now we've regressed, after 20 years, to a place where the loan program that provides a stable source of funding, that is predictable for the States, that quite frankly we do not have to come to Congress every year and ask for in new appropriations, it is capitalized, that we know how to manage and plan, is a very appropriate way to do it. And to accommodate small communities within that structure we also feel is the most affordable and efficient way of doing it.

Mr. Chairman, if I could digress for just one moment, I have a personal comment.

Mr. APPLGATE. Please.

Ms. SAVAGE. Being raised in California, I am really glad to see the enthusiasm of the new Member from California, Mr. Hamburg, for clean water. Our association has testified several times over the past couple of weeks on economic development and merchant marine and fisheries, and now here, and he's always there. So I'm really glad to see Californians participating in clean water issues.

Also, Ms. Molinari—I would like to thank you for the wonderful piece you did in the inauguration. We talk about minority issues and we talk about clean water for small communities and large communities and Indian issues and so on, but it's nice to see that a Member of Congress can also deal with the fact that those of us of the female persuasion cannot find a ladies room in the United States Congress. [Laughter.]

Ms. SAVAGE. I thank you very much for dealing with our minority needs, as well.

Mr. APPLGATE. You would make a good campaign manager. [Laughter.]

Let me ask Mr. Smith—I have a little concern in what you were heading towards, that if an SRF provides principal subsidies, which

I assume means grants, should there not be a requirement—my concern is that if there is no requirement that the money is going to be paid back some way, what happens to the revolving fund? How are we going to guarantee the solvency of the fund? That seems to be a concern.

Mr. SMITH. The main concept that I'm stressing there is that a separate grant fund outside the revolving loan funds, I think, would be very detrimental to, A, the compliance efforts that we're trying to accomplish to begin with; and B, it is going to undercut the SRFs and their loan capacity.

The exact mechanism of how we provide a subsidy could be by appropriating grants to an SRF and allowing the SRF to distribute grants on a prorated basis, according to some means test. Principal subsidy, I think, is a euphemism that has developed over the past three or four years as a means of trying to distinguish between the construction grants traditional Title II approach versus a new approach that would incorporate SRFs.

So I agree with what you are questioning. The corpus of the SRF does need to remain intact, but some sort of principal subsidy or grant to reduce the construction costs is necessary.

Mr. APPLGATE. So you're really talking about a blending, as Ms. Savage was saying?

Mr. SMITH. Yes.

Mr. APPLGATE. So bring it back, maybe have a separate program, but it has to be a combination of a grant and a loan?

Mr. SMITH. Yes.

Mr. APPLGATE. I agree with that. A little money can go a long way in small communities. I brought that up in the last year or so of the Bush Administration. They doled about \$500 million that went primarily to five communities, large communities, and \$500 million would go a long, long way to helping the needs—just on a grant basis—for small town America. We aren't trying to compete or to have the large and the small competing. We have to develop a program that is going to address both of them because both of them have problems. So that was the concern, and when I saw this, I just wanted to get a little bit of a clarification of the direction that you were going in.

I think that's all I have right now.

Thank you very much.

Mr. Boehlert?

Mr. BOEHLERT. Thank you, Mr. Chairman.

Ms. Savage, Mr. Smith, and Mr. Givens, I want to thank you for your helpful and thoughtful presentations. It is very valuable information.

Pardon my parochialism, however, if I zero in on Mr. Porter, because the New York watershed problem is one of critical importance to the district that I am privileged to represent that does involve millions and millions of people, as you have correctly observed, Mr. Porter. On the one hand, in essence, you have one area of the country being asked to accept a no-growth policy, which obviously is unacceptable. But we have to be very mindful of the water needs of this area. Are the various jurisdictions beginning to recognize that there are some competing needs here?

Mr. PORTER. Yes, definitely. The city understands that the imposition of police powers to enforce regulations through invasiory authorities will not work. It can certainly freeze sewage treatment discharges.

Mr. BOEHLERT. So are you upbeat as you look at this? You have followed this, as I have. At one point it looked like people were going to arm. Now I am encouraged by what I sense is happening, and that is an appreciation on both sides of the other side's point of view.

Mr. PORTER. That's right, and there is a cooperativeness that is quite remarkable.

Mr. BOEHLERT. Are you personally and directly involved in that?

Mr. PORTER. Yes. I was asked by both the city and the communities, as represented by a coalition of watershed towns, to act as what they called a "facilitator" on their joint behalf.

Mr. BOEHLERT. Well, with your reputation and experience, I couldn't think of a better person to do that. I wish you well in your important responsibilities.

Let me ask you, you're familiar with the Clean Air Act and how we have the trading and the allowances and all that. That was a very innovative approach. Do you think we might be able to do something like that with clean water? And would you comment on that?

Mr. PORTER. Yes, certainly. There is one company, for example, in the watershed now that discharges a very minute amount of phosphorus. Because of the phosphorus goals of the city and the way those are being applied, it will not permit any increase, even if the current level of that discharge on a daily basis is virtually zero. If it were possible to invoke the "bubble concept" as it is applied in the Clean Water Act, that would do away with that problem.

Mr. BOEHLERT. You mean the Clean Air Act?

Mr. PORTER. Yes, Clean Air Act. I'm sorry.

Mr. BOEHLERT. I would appreciate it if, following your testimony, when you get a free moment, if you would be kind enough to just drop me a note and outline that particular example.

If we don't have some flexibility, in that particular example, this company would not be permitted to have any growth.

Mr. PORTER. That's right.

Mr. BOEHLERT. And yet, it's only a minute contributor to the overall problem.

In a watershed area like this, when you have communities—at random, out of 3,000 counties in America, I'll pick one, Delaware, which I happen to represent—should applications under the SRF in a county like that be given priority consideration in view of the fact that it has a significant impact on the overall watershed for a major metropolitan area? My conclusion is yes, but I want an objective response to that question.

Mr. PORTER. No, I would concur. But more generally, it's a matter of balancing the interests of both. In terms of the application of any of the policies, just to make a general response, the city does now fully understand that without the cooperation of those communities it cannot protect the watershed, particularly with respect to nonpoint sources. But in terms of working out agreements such as

that, it has an incentive that is a carrot now for the city. So in that respect, there is emerging a partnership between the major urban area and the rural communities in its watershed.

Mr. BOEHLERT. Mr. Chairman, I know it's not fair for me to dominate, and I'll conclude now.

Let me just ask you for an assessment. Are you upbeat as you look at this critically important situation?

Mr. PORTER. Yes.

Mr. BOEHLERT. And I hope you will do some writing on it, because I think it's very instructive for the rest of the country to learn from this experience between this major area, with the water needs of 10 million or so people, and the impact it has on the lives of tens of thousands of people in the suburban and rural areas who have a need to live and work and play and grow. Thank you very much.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Boehlert.

The gentleman from Louisiana, Mr. Hayes?

Mr. HAYES. Yes. Thank you.

Mr. Smith, in your statement there was a sentence I wish you would elaborate on. It's on page 3, where you're talking about the governor and the director having a standard for the Ohio EPA to be assistive rather than regulatory, and then there is this sentence: "Nowhere is that philosophy better embodied than in our SRF program. We have abandoned the construction grants program command and control methods and seek to accomplish water quality objectives through comprehensive assistance rather than compliance enforcement."

Could you give me an example to flesh that out? I want to be sure that I understand what you are saying has been successful.

Mr. SMITH. The best example I can think of is a very small, rural recreation lake community in the far northwestern corner of Ohio. We call it Nettle Lake. It's an unincorporated area, a group of residents around that lake. With the blessing of the County Commissioners they contacted us and said, "We'd like some help." We did our best to help. We set up an interdisciplinary team of folks who traveled that long distance on a regular basis and conferred with the citizens' group to help them work themselves through the process of figuring out what their needs were, what types of systems were appropriate for their situation, what sort of physical and geologic constraints are present around that lake, always keeping an eye toward cost-effectiveness, helping them set up a system which is going to give them the ability to collect adequate revenues and still pay back not only the capital portion of their loans, but provide for operation, replacement, and maintenance funds over a longer term.

We're trying to give them a whole package, and we're not approaching it from a standpoint of, "You've got a problem; fix it; go out and hire somebody to do it for you, and it needs to be done in 18 months." We are helping them on their time schedule toward the ultimate goal that they set. We are being of assistance to them rather than regulating them.

Mr. HAYES. I appreciate that. I will just take a moment because of the constraints of time.

Dale, in your testimony when you refer to Region 6 out of Dallas with enforcement activities, that really ties into the question that I was asking Greg. What do you do when the mandate is there, but when the community cannot be mandated to pass a tax, nor can the community be mandated to pass a bond issue? Because both require a public approval that is a submission to voters, which a community can submit, but not mandate the outcome of the election. Even in Louisiana, that's not as easy as it used to be.

What do you do when your mandates are financial but your needs are environmental? Which is what you're driving at here, and which is what you're talking about, alternatives in funding, and then you're talking about particular violations where funding might be derived by a source, in effect, directing a fine for a point source of pollution to an activity in an associated community. I assume that's what you're aiming at, something like Superfund clean-up where they are mandating the activity or mandating a more general activity in the area. Is that what you're suggesting?

Mr. GIVENS. Yes. The specific case I had reference to was a feed mill for one of the Nation's largest chicken and poultry operations, where they had violations of a point source nature, inadequate or lack of treatment. And after all negotiations and encouragements in trying to get them to comply with the statutes, they didn't do it. So we assessed a penalty against them. After further negotiations with them we came up with the suggestion that they devote the dollars from that penalty, rather than having it go to the general fund or the State, into the community to assist with sewage treatment. This is a rural community that had very limited sewage treatment needs, and we felt that the dollars would be better spent to help the community rather than coming to Baton Rouge.

In trying to accomplish what you're talking about, we have traditionally spent many long hours, including in communities in your district, until the wee hours of the morning in trying to work with city councils and play "devil's advocate," if you want, in some cases to get them to understand that they have to bite the bullet and provide the waste treatment that's needed on that to avoid large fines that would be coming down from either the State or EPA, but usually we use EPA as a whipping boy in that case, where we can play that devil's advocate situation.

Well, I would point out that that situation worked very well with the community of Crowley, where they were able to install about 175 acres of their innovative treatment. The last time I was over there the manager for that facility, for instance, indicated that the utilities cost to operate that sewage treatment facility was only \$95 for that month.

Getting the flexibility into the system so that we can work with the communities is very important. To that end, the Secretary of DEQ has set up a group for preapplication so that anybody, whether it's a community or an industry that is coming into the State for a permitting situation, has the opportunity to sit down and meet with representatives from all aspects of the department's regulations to make certain that we can assist them rather than, as Mr. Smith said, just pointing them off to a consultant or something. That helps quite a bit.

Mr. HAYES. From your personal experience in dealing with what is basically a rural State like Louisiana, in this area, when you get into communities under 10,000, is it your experience that the economic impact of the requirement is the driving force? Or is it your experience that there is indeed any resistance to compliance or a wilful disregard of environmental standards? In other words, which would you consider the driving force, mechanizing the ability to pay, to control the debt service, to control technical assistance? Would you say that's the driving factor, and if so, in what percent of cases? Or would you say that there's still a resistance to the fact that a standard is being imposed at all? How would you equate those?

Mr. GIVENS. By contrast, in Louisiana the Mayor and Director of Public Works of Baton Rouge a number of years ago didn't like these mandates coming down from on high, didn't think they were necessary, and actually sued EPA, a very belligerent attitude that resulted in substantial penalties and sanctions against Baton Rouge.

By contrast, the mayors or police juries in the small communities are usually very willing and desirous of providing that treatment. The problem is just as you have indicated, and that is of financing and how to go about paying for it.

Mr. HAYES. And the ability to attract the expertise to direct them on what are feasible and economical alternatives?

Mr. GIVENS. That's correct, sir. And to that end we have stressed the use of innovative treatment systems, such as the one that was installed in Crowley and Mandeville and other small communities around the State. The problem that we're having there is that we're going to have to provide some flexibility with respect to some of the effluent requirements, particularly that with respect to nutrients in the form of nitrogen. We have one situation where a discharge from one of these innovative systems goes into a wetland, a "brake," as we call it in Louisiana, and that water body, that receiving area, has a tremendous bass population in it and is doing just fine, yet the treatment facility is having trouble making the number that we regulators have established in the permit for nitrogen.

I think what I'm telling you is that we don't need that lower number on nitrogen because the fish don't know the difference, and they're doing just fine.

Mr. HAYES. Thank you very much.

Thank you, Mr. Chairman.

Mr. APPLEGATE. The gentlelady from New York, Ms. Molinari?

Ms. MOLINARI. Thank you very much, Mr. Chairman.

I am obviously on the other side of the equation relative to the problems highlighted by Mr. Porter and emphasized by our ranking member, Mr. Boehlert.

Along those lines, Mr. Porter, if I may, I am greatly concerned—and I am certainly not comfortable in the position of being an advocate for the city administration—but I am concerned that the end result of a lack of management may be the realization of a filtration system that is going to cost upwards of \$8 billion in today's estimates and, as you stated, would really provide us with an inadequate drinking water system anyway.

I am fascinated with your testimony, but I am frustrated by a lack of direction for the Congress. What can we do relative to the upcoming reauthorization process to make sure that the right thing is done relative to cooperation between the communities?

Mr. PORTER. I suggest that the Clean Water Act really helped communities prevent pollution. The Clean Water Act, as I did mention briefly, has emphasized remediation. So at least in the northeast, there is high quality already, then that has a low priority among the State agencies responsible.

So when new mandates come along that in fact redefine what quality is, with the consequences we are now experiencing in the State, these small discharges, these municipalities and communities are unprepared for exactly the reasons that the other panel members have discussed.

Ms. MOLINARI. But isn't that particularly exacerbated when you have the upstate-downstate tension that exists in New York? No matter how much flexibility you give the upstate areas relative to a planned development and their abilities to project, isn't there still going to be a resentment? And then, therefore, a lack of cooperation, that in fact it is their land that we are still going to be governing to a very large extent, "we" being either New York City or the Federal Government?

Mr. PORTER. That antagonism did exist and it continues to in some degree. However, it is remarkable the degree to which community leaders are willing to recognize their own environmental interests and also recognize that they concur with New York City's interests. In that respect, community leaders who politically thought initially that it would be folly to even appear to be willing to entertain a partnership with New York City are now very aggressively pursuing that.

So I think the promise of that partnership is definitely there.

Ms. MOLINARI. Is part of that partnership sweetened by New York City's ability to purchase some of the more environmentally sensitive lands up there?

Mr. PORTER. No, that's not a sweetener, that's a sourer.

Ms. MOLINARI. A sourer?

Mr. PORTER. Yes.

Ms. MOLINARI. So in other words, they don't want New York to come in and compensate them?

Mr. PORTER. The land purchase question is a very contentious one because the communities perceive that as further limiting their own options for growth. So it's a very complex issue, as a matter of fact, but that basically is how communities currently tend to react. They are not in favor of the land purchase program generally.

Ms. MOLINARI. So your suggestion, then, is that we modify some of the language in the Clean Water Act this year to change the nature of the mandates?

Mr. PORTER. Yes.

Ms. MOLINARI. Okay. I appreciate that. Thank you. Obviously Congressman Boehlert and I will be contacting you to see how we can best do that, to get both of our municipalities and localities on board to achieve that. This is something that is of great concern

to everyone who enjoys the tremendous quality of New York City drinking water. Thank you.

I just have one quick question for Ms. Savage. If you could just expand a little bit because obviously, coming from New York, which does know how to leverage the revolving loan fund, I'm at a little bit of a disadvantage relative to the discussions. Could you please just go through for me a little bit your association's position on grants versus loans and what direction you recommend the committee emphasize?

Ms. SAVAGE. Thank you, I would like to do that.

The discussion really began in the early 1970s with the 301(h) waiver, which provided the opportunity for communities not to go to a secondary treatment level but maintain primary if their ocean outfalls were approved by the Environmental Protection Agency. At that time, you know, Tom Jorling was the Assistant Administrator for Water.

Also at that time, as I understand some of the discussions Tom had with some of the coastal cities, special accommodations for grants for the larger cities—higher percentage grants—was offered by the Environmental Protection Agency. So the debate really began with the larger communities on the coastal waters not going to secondary when the rest of the country was in fact mandated to do so.

So there is some level of resentment and concern by other communities who proceeded in a timely way to fund their environmental protection needs when in fact some of these larger communities did not go the same route. So the tension is that if now—10 or 15 years later—we're putting more money back into those communities that weren't moving at the same pace, is that in essence promoting noncompliance with the requirements of environmental statutes?

This is the upshot of how our association came to a position of not supporting the \$500 million for the coastal cities, and why the Governor has in fact supported that position to the White House in his discussion on the stimulus package.

No question, these larger communities have serious environmental needs, New York City and Boston Harbor among them. But I guess the question is, what are we about doing? Are we out to promote enforcement and compliance with environmental protection? Or is it a matter of subsidizing and supporting some of the communities that may not have been on the same track as some of the others?

So as you look at this in your decisions in this committee and others, be well aware that you may get a lot of pressure from some of those larger communities. But if you go the other direction, you may hear from a whole lot of communities throughout the United States that are being silent on this issue.

Mr. SMITH. I think we have to echo the ASIWPCA position. In Ohio we have had many large metropolitan areas that have taken the Clean Water Act mandates and deadlines seriously and moved ahead to meet their pollution control obligations. Not to cast aspersions on other cities elsewhere in the country; I'm sure that they have made similar efforts, but the feeling definitely is that we did it, why can't everybody else?

I think the noncompliance issue that Robbie mentioned is a very serious one. There is a perception that as long as grants are being handed out on an individual basis, that it is incumbent—almost a given—that any given local official is going to hold out and not move forward on the outside chance that he or she can receive one of those grants. So it is a very definite detraction from forward progress.

Mr. GIVENS. I just was going to echo that situation. As I pointed out, we have recently lowered the loan rate on our SRF program to 2.95 percent, and we still have communities that are holding out for grant dollars. That was a problem in the early days of the construction grant program; you couldn't give the money away, and then when it got to going away, everybody tried to get it at the last minute.

I think that we need to have a situation where we foster that loan program because it is doing a good job, but we also have to have a mechanism of providing grant dollars for those folks who just can't afford any other way to get there. I hope we can handle it.

Mr. APPLGATE. The gentleman from Illinois, Mr. Poshard?

Mr. POSHARD. Thank you, Mr. Chairman.

I will be brief, but I am interested in a couple of things.

First of all, I would like to second Mr. Boehlert's request to Mr. Porter, that you do some writing. This is an incredible problem between the urban and the rural areas that exists in the watersheds of the major cities around this country. I know there are differences in every community, but still, I think that needs to be done to save us some time and money.

I would just like to ask Mr. Givens about the explanation on page 3 in your testimony, where you go through the idea of encouraging companies that are in negotiations concerning an environmental penalty assessment to consider dedicating all or a portion of that settlement amount toward projects in the local community where the alleged violations occurred. How does that work logistically? The State office in Louisiana encourages those companies, instead of sending the money to Baton Rouge, to spend it in the local community for a sewage treatment project or a lift station or something like that? How did you come to that understanding?

Mr. GIVENS. It's a formal process whereby the entity that has been assessed a civil penalty enters into a negotiation with the Department of Environmental Quality and either volunteers to just go ahead and pay up front or, if we can identify a project in the area, to actually take those proceeds and apply them to the community. It's, I think, an innovative thing that we're trying to do.

We're just about to sign the agreement on this one with the chicken feed mill that I talked about on that, and it's one that I've been pushing for a number of years, but I hadn't been able to get any secretaries to go along with it. So we're on the beginning edge of that. It is something that has been used in the wetlands program before, set-asides or incentive type of things, and I think it has some applicability here.

Mr. POSHARD. Does the State general assembly have to pass any law to allow you to do this, or is this an in-house kind of thing that you developed?

Mr. GIVENS. This is an in-house procedure right now that we're doing. Our state attorney general will have to ratify it. He has to approve of any settlement agreements that we do. We don't anticipate any problems. Perhaps our division administration and the budget officers may have more a problem with it, but since it's putting it back in a local community, I think it's very sellable.

Mr. POSHARD. I think it's an innovative idea. I'm going to encourage folks back in Illinois to look at that.

The other thing I want to ask you is, you've entered into a Memorandum of Understanding with the U.S. EPA Region 4 concerning enforcement activities, and where people are applying for the SRF program, you're extending the schedule for compliance. Is that already in process? Are you already doing that?

Mr. GIVENS. Yes, sir, we are.

Mr. POSHARD. And that's okay with EPA?

Mr. GIVENS. Yes, sir. In the old grant program, it took almost seven years from the time a community applied for a grant until they got concrete in the ground. The SRF program is much faster, but it still carries much of the baggage of the grant program—the Title 2 requirements and so forth. So to try to recognize that, the Water Division in Region 6 that Louisiana is a member of and DEQ got together and came up with some language for an MOU that basically says that if somebody is trying to help themselves, they are actively trying to and are in that process, then we have a mechanism to extend within reason the compliance part to allow that process to catch up.

Mr. POSHARD. It makes some sense. Thank you, sir.

Thank you, Mr. Chairman.

Mr. APPELEGATE. Thank you, Mr. Poshard.

I'd also like to recognize that Congresswoman Brown from Florida is with us, and also our very distinguished Chairman of the Subcommittee on Surface Transportation, Mr. Rahall, is also with us, neither of which have questions for this particular panel.

I would say thank you very, very much again for your testimony, your forthrightness. You've certainly laid out your plans well, and it will play a very important role in our final conclusions.

Thank you very much for being here.

Mr. APPELEGATE. Next we will call up a panel: Mr. John Ranson, Cabinet Secretary of the West Virginia Department of Commerce, Labor, and Environmental Resources, who will be accompanied by David Callaghan, Director of the West Virginia Division of Environmental Protection, and Mike Johnson, Assistant Chief of Construction Assistance, Office of Water Resources; and then we have Mr. Don Berryhill, Administrator of the State Local Government Financial Assistance Program, Florida Department of Environmental Regulation; Paul Marchetti, Vice President, Council on Infrastructure Financing Authorities, and Executive Director, Pennsylvania Infrastructure Investment Authority; Richard Rice, County Commissioner of Bedford County, Pennsylvania; and Mr. William Stafford, Chairman of the Lee County, North Carolina Board of County Commissioners, accompanied by Bob Joyce, who is the County Economic Development Coordinator and Planning Director.

Mr. BOEHLERT. Mr. Chairman, while our panelists are getting situated and are getting identification before them, I would like to

recognize Dick Rice, who is representing the Southern Alleghenies Resource Conservation and Development Council. Mr. Rice is also the Chairman of the Bedford County Commissioners, and as all of us on this committee know, Bedford County is the home county of our distinguished ranking Member, Bud Shuster.

Congressman Shuster is not here, and I'm glad he's not here, and I'll tell you why in just a moment. He's appearing right now before the House Administration Committee to discuss our committee budget for the coming year, and I think he can do the Lord's work over there very effectively, because we know we need some resources for this committee to operate this year to get things moving in a hurry.

Paul Marchetti, who's the Executive Director of the Pennsylvania Infrastructure Investment Authority, is also with us today, so Pennsylvania is well-represented, and I know that my colleague, the ranking minority Member, Mr. Shuster, is disappointed he can't personally be here to welcome you, but I know that you know where he is and what he's doing. It's very important work.

Further, Mr. Chairman, I understand that some arrangements have been made so that Mr. Rice would be an early witness because of travel accommodations.

Thank you very much.

Mr. APLEGATE. Mr. Rice?

**TESTIMONY OF JOHN RANSON, CABINET SECRETARY, WEST VIRGINIA DEPARTMENT OF COMMERCE, LABOR AND ENVIRONMENTAL RESOURCES, ACCOMPANIED BY DAVE CALLAGHAN, DIRECTOR, WEST VIRGINIA DIVISION OF ENVIRONMENTAL PROTECTION, AND MIKE JOHNSON, ASSISTANT CHIEF OF CONSTRUCTION ASSISTANCE, OFFICE OF WATER RESOURCES; DON BERRYHILL, ADMINISTRATOR, STATE LOCAL GOVERNMENT FINANCIAL ASSISTANCE PROGRAM, FLORIDA DEPARTMENT OF ENVIRONMENTAL REGULATION; PAUL K. MARCHETTI, VICE PRESIDENT, COUNCIL ON INFRASTRUCTURE FINANCING AUTHORITIES, AND EXECUTIVE DIRECTOR, PENNSYLVANIA INFRASTRUCTURE INVESTMENT AUTHORITY; RICHARD RICE, COUNTY COMMISSIONER, BEDFORD COUNTY, PA; AND WILLIAM C. STAFFORD, JR., CHAIRMAN, LEE COUNTY, NORTH CAROLINA BOARD OF COUNTY COMMISSIONERS, ACCOMPANIED BY ROBERT F. JOYCE, LEE COUNTY ECONOMIC DEVELOPMENT COORDINATOR AND PLANNING DIRECTOR**

Mr. RICE. We appreciate Congressman Shuster being there, also.

Mr. Chairman and committee Members, we want to thank you for the opportunity to provide testimony on behalf of the Southern Alleghenies Resource Conservation and Development area. The Southern Alleghenies Resource Conservation and Development area consists of approximately three million acres in south-central Pennsylvania, and I believe you have a map. Less than 500,000 people reside in our counties of Bedford, Blair, Cambria, Fulton, Huntingdon, and Somerset. This low population of density classifies our area as primarily rural.

The loss of jobs and industry in our region has a severe impact on the economic viability of our small communities at all levels of

local government. The 1990 Census shows that we have lost both jobs and population since 1980. Like many rural areas, we have higher unemployment and lower per capita income than our urban neighbors. We also have a higher percentage of elderly people on fixed income.

Our area has a large number of existing on-lot sewage disposal systems which are malfunctioning and are contributing to the contamination of both surface and ground water resources. This not only degrades water quality, but also poses a serious health threat, as evidenced by the many documented cases of spring and well contamination.

The cost of providing needed sewage facilities has often exceeded the financial capabilities of our communities. Sewage projects are more expensive per capita in rural areas than in urban areas due to our low population density. Inadequate levels of funding to rural areas, coupled with increased emphasis on loans rather than grants, has made it extremely difficult for small communities to comply with the State and Federal sewage regulations. An area such as ours has insufficient population base to support loan repayments and often are unable to even pay for the preliminary planning and engineering.

In order to address rural waste water needs, we recommend the following proposals for your consideration:

Work with States to develop a grant/loan program that truly reflects the needs of rural America and the higher per capita cost of sewage facilities in our communities. More grants, lower-interest loans, and longer repayment terms would be a good first step. Underwriting the local cost of planning and engineering would also be an important incentive to the communities with limited resources.

Encourage the development of standards and specifications for a package treatment plant that would solve many rural communities' needs without requiring large engineering costs for individual designs and similarly large construction expenses.

Work with States to encourage projects to demonstrate alternative sewage treatment systems. Few rural communities have municipal systems because of the expense of the conventional systems. The State and Federal Government have not provided sufficient funding and technical support for the development of alternative systems which better fit a rural community due to the availability of abundant, relatively inexpensive land. Demonstration projects that would provide solutions to unique problems in rural areas should receive the highest priority.

An example in our region would involve the development of a treatment plant for both sewage and acid mine drainage. The successful implementation of such a system would dramatically improve water quality in our streams currently polluted by sewage and mine drainage.

Implementation of strategies like these will go a long way toward meeting the sewage treatment needs of rural and small communities. Not only will we be providing water quality, but we'll also be increasing our ability to attract jobs and improve our standard of living.

I want to thank the Members of this committee for your assistance in helping the Southern Alleghenies Resource Conservation

and Development Council and also the resource conservation and development councils throughout the Nation, because we do cross boundary lines and we take care of problems. We can do this working together to build a stronger rural America.

Thank you, Mr. Chairman.

Mr. APLEGATE. Thank you very much, Mr. Rice. When you were describing your area, it sounded like you were describing my area, and I think that's sort of pretty much the way it is throughout much of the midwestern part of the United States, anyway, and the eastern part, and it describes it very succinctly.

At this time, I'd like to recognize the gentleman from West Virginia, Chairman of the Subcommittee on Transportation, Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

Mr. Chairman, I commend you for having these series of hearings on a very timely issue and a very important issue to rural communities throughout this country. We do have special needs unique from those of urban areas, and the financing of our waste water treatment facilities is of utmost concern to the people we have the honor of serving.

My purpose here today is to introduce Secretary John Ranson of our West Virginia Department of Commerce, Labor, and Environmental Resources, and Director Dave Callaghan of the West Virginia Division of Environmental Protection, who are with us to discuss conditions in my home State of West Virginia, and they are accompanied by Mike Johnson, the Assistant Chief of Construction Assistance, Office of Water Resources.

Mr. Chairman, as the reauthorization of the Clean Water Act continues through this year, we will hear a great deal about the progress that we have made since the original enactment of the law in 1972. That is true, we have made significant progress, but, of course, we're going to hear also about much more progress that needs to be embarked upon. In the past, rural communities and small towns have had trouble getting a significant share of funds available for waste water treatment projects. Although localities with less than 10,000 residents make up 38 percent of the national population, they have received only 24 percent of money loaned from the SRFs.

We could go on, Mr. Chairman, with more statistics, and those, I'm sure, have been relayed during the course of these hearings, but we know that in my particular State of West Virginia, and we will hear from these officials who know it on a firsthand basis, that the SRF is falling short of meeting its goal of assisting communities in the construction of sewer systems. A prime example of that is that in 1992 in West Virginia, we still had over 40 West Virginia towns that were out of compliance with Clean Water Act requirements. It's not the fault of the State. The legislation which created the revolving fund did not recognize that small, rural communities are different than large towns and large urbanized areas.

These hearings, of course, are an indication that this subcommittee recognizes those differences. This subcommittee also recognizes that we can no longer dump the municipalities into one pot and hope that the problems will all be solved. For too long our small communities, as I brought up in the meeting with President Clin-

ton prior to the announcement of his program, have had regulation after regulation heaped upon them without the financial resources to meet those regulations. It has been a prime example of too much stick and too little carrot.

So I welcome the opportunity to hear from Secretary Ranson and Director Callaghan about the problems from our perspective in my home State of West Virginia. They know our situation better than anyone else. They understand the unique problems of rural States. They know how we must cope with the lack of proper sewage treatment, poor water quality, and we could go on down the list, and what that means for our people and our businesses and our efforts to improve our quality of life.

So I introduce to the subcommittee this morning Secretary Ranson and Director Callaghan and extend my special warm welcome and thanks to them for making the effort to be here.

Thank you, Mr. Chairman.

Mr. APPLGATE. Mr. Ranson?

Mr. RANSON. Thank you.

Good morning, Mr. Chairman and Members of the Subcommittee. We have submitted information for the record, and in the brief time available, rather than read that document, I'd like to just reiterate a few points and perhaps amplify on them, mostly information that is in the submittal.

We're a very rural State. We have fewer than 1.8 million people in our whole State, and we have about 12,000 square miles. I suppose if you were to flatten it out, it would be somewhat larger, but it's very mountainous. We have relied very heavily over the duration of the construction grants program on that program for treatment facilities in our State. We've done over \$1 billion worth of projects, and of that \$1 billion of projects, about \$673 million was from the grants program. We've built 117 treatment facilities and 84 separate collection systems with those monies over that period of time.

We've done some recent surveys in West Virginia which indicate that we need 646 more treatment facilities at an estimated cost of \$2.1 billion. Ninety-seven percent of those, according to our surveys, would be for communities with less than 10,000 people. We only have 10 cities in our State with populations in excess of 10,000. The largest cities in our State have about 50,000 people. So we're a very rural, not very densely populated place. In fact, 86 percent of the systems that we need to install would be for communities with less than 3,500 people.

The 1987 Water Quality Act, of course, eliminated the construction grants program and replaced it with the SRF. The logic is good, without any question, but very small and very financially strapped communities have a great deal of difficulty participating. We have many, many communities with 400 or 500 or 600 people. We have relatively high unemployment. We have a great deal of difficulty coming up with secured funds with which to repay the loans.

In the life of the grants program, they, of course, would borrow about 45 percent of the cost of a project in some manner, and the grant would account for 50 or 55 or so percent of the project, typically. Even now, with 0 percent interest, it's very difficult to make

projects fly. What we tend to do is to look at the anticipated monthly sewer bill, and if it's going to be \$25 or less for a household, our SRF rate is 3 percent; if it's going to be higher than \$25 a month, we will back the interest rate down all the way to 0, and even so, very often it's very, very difficult for projects to be financially viable.

In looking at that, I have a couple of examples which I think illustrate that problem. We have one case—and this is in the information that was submitted—where we have a 660-person community in a fairly populated county of our State, actually. They constructed a collection system using a 55 percent grant. The average monthly sewer bill is \$22.99. If that community had had to rely on a 0 percent SRF loan, the average bill would be \$31.60. That's a 37 percent increase. In the information we gave you, there are two other examples, and in one case the increase in monthly rate would be 43 percent, and in the other case it would be actually 73 percent, an increase from just over \$28 a month in that case to \$48 a month.

We looked at 20 other communities which had received EPA grants during the grant program, and of those 20 communities, only four, with populations ranging from just under 4,000 to about 9,000, would have been able to afford their projects. So as you can see, the loss of the grants program has been a significant problem and will continue to be for West Virginia.

We didn't hear yesterday's testimony, but apparently there was a great deal of talk about the need for enhancements in flexibility. I heard you reiterate that point, Mr. Chairman. That is a theme that we would like also to echo. We think increased flexibility in several areas of SRF would be of value to us. As we contemplate recommendations that we might have for you, the first one, of course, is flexibility.

We, of course, would like to see a new grants program or the continuation or reimplementing of a grants program. If that were done, we would encourage you to consider allowing us to reserve up to some reasonable number—we'd suggest 40 percent—of the SRF monies that have been allocated to us, but not used, to be available for grants. I don't know how you might feel about that. We would ask that you consider that.

Definitions of financial hardship and such we think ought to be left to the States. We think definition of small community ought to be left to the States. It's our view, though, that anything under 10,000 or perhaps small community ought to be defined as communities exclusively smaller than 10,000. That, of course, is easy to understand how we might have that view, since we only have 10 cities larger than that.

We urge you to consider extending the loan repayment time perhaps all the way to 40 years. It's currently at 20 years.

We would encourage at least consideration of the restrictions imposed by Title 2 and the Federal cross-cutter laws. There are 30 or 40 various restrictions of one sort or another, and we would urge that those be reviewed with an eye toward perhaps reducing those restrictions in some reasonable manner.

We would encourage that modest amounts of funds be allowed to be used for outreach and for technical assistance. I've heard ref-

erences by others this morning to the value of technical assistance. Currently, 4 percent of the monies are allowed to be used for administration. If that could be increased, let's say, just to 5 percent, just a 1 percent increase, but if the increase could be used for outreach and technical assistance, we would find that extremely useful to us.

We would urge consideration of allowing that land easements could be project costs for projects under SRF. In addition to that, we have quite a backlog of projects that need to be done where the anticipated monthly rates are basically prohibitive. It's a phenomenon you were referring to a few minutes ago, Mr. Chairman. To the extent that there could be increased flexibility in regard to our meeting the time lines without losing the allocations, anything that could be done there, we'd be grateful for.

Another phenomenon that is not unique to West Virginia, but we certainly typify it, is that currently only 20 percent of the money can be used for a project activity other than treatment plans and the trunk, the major line, the interceptor. We have a low population density, we have a lot of hills and hollows, and in our case it's important to be able to use more than 20 percent of the money, if possible, for the tributaries of the collection system. That would not be unique to West Virginia, but it would probably be unique to Appalachia, let's say. But that's a measure of flexibility that would be extremely useful to us.

I think those are the key points that I wanted to reiterate, and I thank you for the time, sir.

Mr. APPLGATE. Thank you very much, Mr. Ranson.

At this time, I would like to introduce the gentlelady from Florida for purposes of introducing the Florida witnesses.

Ms. BROWN. Thank you, Mr. Chairman. I want to thank you for holding these hearings. I think they're extremely important.

I want to welcome Mr. Don Berryhill from the great sunshine State of Florida, by the way, to testify on what is an issue of critical importance to my district. Mr. Berryhill administers the State revolving fund for the Florida Department of Environmental Regulation, and his leadership and counsel will be of benefit to this committee.

I have a written statement that I just want to enter into the record pertaining to my district, but I think it reflects a lot of the whole country and the problems that small counties are having financing septic tanks in their areas. So I just want to make that statement and submit this to the record.

Mr. APPLGATE. Without objection, your prepared statement will appear in the record.

[Ms. Brown's prepared statement follows:]

Statement by the Honorable Corrine Brown of Florida  
House Subcommittee and Water Resources and Environment  
February 24, 1993

Mr. Chairman: I want to thank you for holding these hearings and for inviting Mr. Don Berryhill, from the great state of Florida, to testify on what is an issue of critical importance in my district. Mr. Berryhill's administration of the State Revolving Fund for the Florida Department of Environmental Regulation has been tremendous and I am confident that his leadership and counsel will be of benefit to this Committee.

In reviewing a study by the National Association of Development Organizations (NADO) recently, I found that 75% of all documented wastewater facility needs are in rural communities of fewer than 10,000 persons. To meet these needs, \$13 billion would be needed.

For me, this problem is highlighted most in a small town in my district -- Hastings, Florida. The town of Hastings, a small farming community, has been unable to meet state and federal domestic waste discharge standards since 1987. The aging wastewater system is crumbling and causing major leaks in the wastewater mains. With the help of the Florida Department of Environmental Regulation, the town finally scraped up enough money through FHA grants to improve treatment; however, there are still many homes on failing septic tanks and individual wells which represent a significant health hazard. We are currently pursuing

funding from other agencies to try to help Hastings alleviate this problem.

The biggest problem for rural areas is that they simply cannot raise the capital necessary to meet their needs. NADO says that the rural areas simply cannot reach the economies of scale necessary to result in reasonable consumer rates. Some how, the federal government has got to help.

I am still reviewing President Clinton's package but am encouraged by what I have seen so far. Hopefully through a commitment from the Administration and active leadership from this Committee, we can soon resolve the problems we have in Hastings and in other similar communities throughout the Country.

Mr. APPLEGATE. Mr. Berryhill?

Mr. BERRYHILL. Mr. Chairman, Members of the committee, I am Don Berryhill with the Florida Department of Environmental Regulation. Unfortunately, it's a little bit chilly in Florida this morning, too, but not quite as cold as it is here. But the weather is beautiful.

Thank you all for the opportunity to appear here today and offer our views on problems that small communities in Florida are facing as we attempt to meet stringent and, I think, necessary environmental standards.

I will also mention that Congresswoman Brown had invited Mr. Ernie Frey director of our department's district office, to testify today, and, unfortunately, he became ill. I am sort of a late substitute, but I am happy to be here. Mr. Frey sends his regrets.

Florida is now the fourth most populated State in the Nation, and we're continuing to grow rapidly. However, even though we're fourth in the Nation, we're still a State of small communities. Right now we have over 4,000 publicly and privately owned waste water facilities in the State. Over 80 percent of these serve less than 1,000 people, and more than 80 percent of the incorporated communities in our State have less than 20,000 population.

Many of our small communities have no central waste water facilities, and in many that do, the older collection systems need major rehabilitation. Right now we have more than 1,700,000 septic tanks in the State of Florida. Many of these are not operating properly. These failed septic tanks are a potential threat to people's health and they pollute the surface and ground waters, and the replacement cost of septic tanks now with central sewers may exceed \$10,000 per residence. Many of our families in small communities in our State don't earn that much money in a year's time.

Although these costs are high, I think we should all keep in mind that the problems we're talking about can be fixed. We have the technology, we have the programs, we have trained people, and I think to a great extent we have the willingness of the people to face and solve these problems if we can just give them some help.

I'd like to give an example using the small town of Hastings in Florida. Since 1987 this small community—it's a small farming community—has never been able to meet the waste discharge standards. They applied to the State for funds back in 1985, and this is under what we call an old State grants program now, but they, along with 61 other small communities in the State, did not get funded. We just didn't have enough money. The town finally received some funds through the Farmers Home Administration Program and made treatment plant improvements. However, they still need funds for some collection system work, and they need to eliminate some remaining failed septic tanks.

This small community's attempts to correct their waste water problems over the years clearly indicates their willingness and interest in trying to meet stringent requirements that must be imposed to protect the environment that all of us enjoy. We see this desire to do the right thing in most of our small communities. I will admit a few are still reluctant, but I think most now understand the importance of fixing these problems. But if these costs exceed what the citizens can afford to pay, the facilities just don't get

built, and, unfortunately, these problems remain and grow larger all the time.

We are funding some small communities through our revolving loan program. This is an excellent program, and we thank all of you for the Federal funding support that you've given us thus far, and we sincerely hope that you'll see fit to continue this support. In our program in Florida to date, we've made low-interest loans of over \$330 million to 23 communities in the State. Eleven of these are communities that have a population of less than 20,000, and this is what we use as our cutoff population for small communities in our program in the State.

To try to assist more small communities to come into the SRF program, we're currently revising our State rules—this is something that we can control—we're revising our rules to provide loans for the upfront planning and design work, as well as the construction costs. Since we're able to meet our equivalency requirements under the Federal laws through the funding to our larger communities, we are planning to drop the Title 2 requirements for our small community projects, assuming that our proposed rule changes are adopted. But even with changes such as these that will provide some additional benefits to the small communities, we still have communities like Hastings. Though they've worked and struggled over the years, they still need help, and a lot of these people simply cannot afford to repay a loan even at 0 percent interest.

In addition to Hastings, the current list of projects that we maintain that are in the planning phase—and these are projects that are planned for construction over the next four to five years—we have 85 projects on that list, \$1.3 billion worth, and over 30 percent of these are for small communities. It might be of interest to note that the very smallest project that we have on this list comes from Gilchrist County School Board. The school board has requested \$287,000 to provide modern facilities for Bell High School there. Gilchrist County, even though it's in the fourth most populated State in the country, has less than 10,000 people there. So, yes, we in Florida have a small community problem also.

With problems like these, what can we do? I think you've all heard a number of recommendations. I'm going to quickly add ours to the list. I think that mostly we'll endorse things that others have said.

The first recommendation that I'd like to make is a fairly obvious one. We would like to see more funding for the SRF program and hopefully some money that would be earmarked especially for small communities. We would recommend that the funds be administered through the SRF program. This is an established, existing, working program, and we would prefer not to see another red tape-laden grants program.

Along with this, as has been mentioned earlier, we would like to see more flexibility at the State level in funding projects in communities that are financially stressed and possibly making loans from this special fund at less than 0 percent interest. This is another way of saying a principal subsidy or, in effect, a grant, but base the loan on the amount of money that a community could realistically afford to repay. Obviously, the amount of money made available in

this fashion would have to be limited so that the overall financial health of the loan fund could be protected.

We would like to also see the terms of the loans extended for small communities. This would reduce the annual payments that the communities had to pay on the loans, thus allowing lower monthly charges to the citizens.

We would like to see Title 2 requirements eliminated for small communities at the Federal level. Also, in our case—and I'm not sure about other States, but I suspect they are having difficulty—in our State, we're having more and more difficulty coming up with the 20 percent matching funds. We would like to see that eliminated or, as a minimum, limit the State match to the current Federal funding levels.

We, as was brought out by West Virginia, would also like to see elimination of the 20 percent limit on the use of SRF funds for funding collector sewers. This gets back to those more than a million septic tanks that we have in the State. We have needs for a lot of collector sewers in our State. Also, along with this, somewhat of a minor thing, but we would like to see the allowance of funding of land, easements and right-of-ways, because in the case of collector sewers, this also can be a major cost.

In concluding this, I'd like to emphasize again that we are facing problems that are fixable. Our small communities just need some financial help. I believe that if you will help provide us with additional funding for the small communities, give us at the State level greater flexibility in administering the programs to better fit our needs, we can more nearly meet all of the small community needs.

Again, I thank you for this opportunity and would be happy to answer questions. Thank you.

Mr. APPLGATE. Thank you very much, Mr. Berryhill.

At this time, I'd like to recognize a very distinguished colleague from the great State of North Carolina, Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman. Another one of my constituents, the former president of Centura Bank, Mr. Futrell, just came in the door, so I'm glad to have him have an opportunity to hear you call me distinguished or whatever it was you called me.

Mr. Chairman and Members of the subcommittee, I am pleased to have the opportunity to introduce to the subcommittee one of the witnesses, I believe the last witness on the schedule today. He is Mr. William C. Stafford, Jr. The program says he's Chairman of the North Carolina Board of County Commissioners. He is Chairman of the Lee County Board of Commissioners, which is one of the 100 counties in North Carolina. I suppose this is the same in many States, but the county commission is the executive governing board for that very dynamic and also mostly rural county in south-central North Carolina. So as chairman of that board, he is the chief executive officer for that county in our district.

Mr. Stafford also has with him Mr. Robert F. Joyce, who is Lee County Economic Development Coordinator and Planning Director, and I want to say to them that I appreciate both of you taking the time to come here and to share your views on this important subject with the subcommittee.

Thank you, Mr. Chairman, for that opportunity.

Mr. APPLGATE. Mr. Stafford?

Mr. STAFFORD. Good morning, Mr. Chairman.

For that warm welcoming introduction, I say thank you, Representative Valentine.

Members of Congress, today I am here to speak to you regarding the burden that Lee County and other such rural areas have to bear in the cost of the Clean Water Act Federal mandates concerning permitted sewage treatment facilities and wish to share with you comments which hopefully will lead to an area of—and I'm going to introduce a word—sustainability.

The provision of safe waste water treatment is crucial to the social and environmental health of rural communities. The Federal Government recognized the need to restore integrity to our Nation's waters by adopting the Clean Water Act. The Clean Water Act attempts to address point source pollution by permitting and regulating sewage treatment plants. Advocates of the Clean Water Act can claim many victories, including, but not limited to, the tens of thousands of them constructed since 1981, solving the sanitary sewer needs of many.

Nationally, a large amount of Federal money was devoted to the construction of many waste water treatment facilities in the 1960s, 1970s, and 1980s. In 1987 a program of Federal assistance to the States for construction of these plants was reauthorized in an amendment to the Clean Water Act providing a total of \$9.6 billion in grants through 1990. We've heard much testimony this morning with regard to how little of that came to the smaller communities.

Federal loans will be provided to States for the treatment facility construction only through 1994, at which time all Federal loans for the purpose will cease. The lack of Federal funding to supplement the increasing cost of compliance with Federal mandates, particularly EPA regulations, will unfairly burden rural areas as well as smaller municipalities. Although much has been accomplished by the Federal monies spent to construct sewage treatment facilities, little of this funding ever reached past cities and towns to rural areas such as the unincorporated portions of Lee County, North Carolina.

The bulk of Federal funding during the past decades focused almost entirely on the construction of large municipal waste water treatment facilities for the metropolitan areas. Little has been done to help rural America with failing septic systems and with no affordable access to municipal sewer. When the Federal Government relinquished its responsibility for infrastructure financing to each State in the 1980s, more and more of the financial burden fell on local governments to enforce regulations mandated by the Federal Government.

The problem becomes clear. Large metropolitan areas have a greater tax base upon which to draw the funds necessary to install, maintain, and expand federally-mandated wastewater treatment facilities. There simply is not enough money in smaller rural communities, such as Lee County, to provide adequate sewage facilities to all their citizens who look to local government to solve this problem. This quiet crisis is looming and threatens the health and environment of many other economies, not just Lee County's. It is critical that the Federal Government not take actions that will make

it more difficult for local governments to raise the revenues necessary to meet the growing needs.

The quality of a community's infrastructure is a critical index of its economic vitality. Reliable transportation, clean water, and safe disposal of waste are basic elements of a civilized society and productive economy.

Mr. Chairman, in the interest of time, all of my remarks have been turned in, but I'm going to continue on, but condense these remarks moving forward through this text.

Current Federal regulations resulting from the Clean Water Act are not problematic to local governments due to a lack of funding. The actual regulations themselves are difficult to enforce due to constant changes. The public works director for the City of Sanford, the largest municipality in our county with a population of slightly over 20,000, and the sole provider of municipal waste water treatment in Lee County, refers to Sanford's efforts to stay ahead of the ever-changing regulations as similar to shooting at a moving target.

The City of Sanford's Big Buffalo Sewage Treatment Plant was built in 1975, with a capacity of approximately five million gallons of water per day, for \$5 million. This facility was designed to serve Sanford citizens for 20 years; however, Federal regulations continued to tighten over the following years until, 15 years later, with only half of the sewage treatment plant's capacity having been utilized, the city was placed under special order of consent by the State of North Carolina to comply with the latest regulations regarding a lower amount of dissolved oxygen. Essentially, the City of Sanford was told that although their relatively new sewage treatment plant was only utilizing 50 percent of its capacity, they could not even add one more user without making costly updates.

Moving forward, while the benefit of securing an enduring safe water supply is not disputed, the cost of mandated regulations is constantly growing. These rules drive State policies, which must in turn be enforced by local governments. Although Federal funds were readily available and utilized to construct Sanford's original waste water treatment plant, little Federal assistance, other than a \$750,000 EDA grant, was available when costly updates in the system were completed. The mandated improvements were concluded in 1992 with a cost of \$10.8 billion. The capacity of the system was increased to 6.8 million gallons per day, although the additional capacity was not immediately necessary.

The payment of the cost of federally mandated waste water treatment improvements is not only so obviously borne by the citizens of a municipality. Most municipalities, including the City of Sanford, have resorted to supplementing user rates. User rates allow only for those citizens who actually use the municipal sewer system to pay for the maintenance. However, user rates usually do not fully refund a municipality for its administrative and other economic opportunity costs associated with capital projects of this magnitude.

The pay-only-for-usage policy is also not conducive to the needs of rural sewer users. Typically, rural residential users cannot afford to pay for the full costs associated with the utilization of such systems. This means that in order for a municipality to provide

sanitary sewer to rural residential users, the municipality must look to industrial and commercial users, as well as to ad valorem taxes, to subsidize these costs.

Overall, in discussions with many of our main industries in our area, the cost of waste water management is becoming increasingly higher to them. Guest, Keen, Nettleford—otherwise known as GKN—a local automotive plant in Lee County, has recognized similar financial problems due to rapidly changing Federal regulations. Mr. Dennis Donovan, GKN's plant manager, cites the pressing need for long-term EPA regulations. GKN recently purchased an expensive piece of industrial equipment, which was rendered obsolete long before the equipment was depreciated due to the rapidly changing EPA regulations.

The Clean Water Act has accomplished much good throughout the Nation's urban areas; however, the focus of the Clean Water Act must be broadened to recognize the limited fiscal capacity as well as sewage treatment needs of rural areas as well as urban areas. Sufficient Federal money should both back urban and rural-oriented communities with long-term solutions for the problems existing and strive to fulfill the original intent of the act to ensure the safety and cleanness of our Nation's waters by providing Federal funds for the implementation of federally mandated programs aimed at providing safe sewage treatment alternatives to all Americans. Such action will allow us all to reach a level of sustainability with regard to mandates as well as economic competitiveness.

I thank you for your invitation, your time, and your willingness to hear from rural America. If you have any questions, feel free to ask them.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you very much.

Mr. Marchetti?

Mr. MARCHETTI. Mr. Chairman and Members of the subcommittee, thank you for this opportunity. Since Congressman Shuster couldn't be here, I'll take the liberty of introducing myself, if you'll bear with me.

My name is Paul Marchetti. I come here both as Executive Director of the Pennsylvania Infrastructure Investment Authority, which is otherwise known as PennVest, and as Vice President of the Council of Infrastructure Financing Authorities, which I will refer to as CIFA. PennVest is Pennsylvania's program for funding clean water projects, both drinking water and waste water projects, across the commonwealth, and has been in operation since the governor created it back in 1988. CIFA is a national organization comprised of State entities like PennVest, only it's those agencies that manage SRF programs.

What I'd like to do is just paraphrase my testimony. I think you all may have copies of it.

My basic point is simply to show that the SRF program can be modified to accommodate the needs of small and rural communities, and I would like just to offer PennVest as an example for how that can be done. My suggestions are not really radically different from a lot that you've heard already. I simply want to say that we have some experience over the last five years that shows

that some of the suggestions that you already heard can actually effectively be put into place.

As I said, we started in 1988. PennVest was capitalized by approximately \$1 billion in State funding, and added to that is approximately \$300 million in SRF funding. The State funding can be used for both drinking water and waste water projects, and the SRF funding, of course, can only be used for waste water. Since that time, we have provided loans and some grant money of slightly over \$1 billion. We have over 650 loans that we have made since that time and are currently active.

What we do when we make loans is that we look at the affordability of a project. We take the cost of a project, the O&M that users are going to have to pay, their other debt service, and compare that with the ability of a community to afford the project that we're financing, and we try to tailor our assistance in order to make these projects affordable. We do that both by lowering our interest rates or adjusting those interest rates to come up with what we think are affordable user rates, and we also work in grant money, which, of course, has to be State grant money, since we can't use the SRF for that purpose. When we do a State-funded loan, we can also extend the term of that loan out to as far as 30 years. We use each of these mechanisms in order to make our loans affordable.

I would like to also point out that a lot of our assistance already is going to small communities and rural areas. Approximately a third of our funding goes to small systems, which I'm defining as those systems that have less than 1,000 connections. Translated into population, that's about 3,300 people or less. They get approximately a third of our financial assistance, but comprise about 60 percent of the loans that we approve. The difference between those two percentages is simply that small systems tend to have smaller loans. They average around \$1 million as compared to large systems, whose loans average a little over \$2 million.

If you look at the distribution of our assistance another way, about half of our financial assistance goes to rural areas, which is they get slightly over half of our loans, if you count them in terms of number of loans.

Pennsylvania has a very large contingent of small systems. There are about 2,500 community water systems and 4,000 sewer systems across the State. If you take all of those combined, about 75 percent of those are considered small by the definition I just used. PennVest was really designed to address the needs of those systems, which is why we have some flexibility built into our program which we would like to see extended to the SRF program as well.

To get down to those suggestions, we have three, which not only I can suggest from our experience in PennVest, but also these are suggestions that CIFA has made in a number of contexts, which we would like to see as modifications to the SRF program.

One, of course, is extending the program for drinking water. We currently do that in PennVest, and we think there is a tremendous need out there, certainly in Pennsylvania and I think in other States, for small communities in particular to come into compliance with the Safe Drinking Water Act, which has some very expensive provisions in it. We would like to see the SRF extended to cover

drinking water systems, and we fully support the Administration's proposal to do that and would like to see this committee and Congress in general further that effort.

Secondly, we would like to see, as other people have suggested and I've described in what we already do, the provision for the SRFs to be able to make grants. We think that grants are needed in some cases. We certainly do that now in PennVest with our State money. I'd like to point out that we've done about \$45 million worth of grants since we started in 1988, and almost 80 percent of that has gone to small systems, which just shows that that is where the need for this funding is.

We think that can be done within the context of the SRF either through a principal writedown or some other mechanism. We typically, through CIFA, support a principal writedown mechanism. But it's important that grant money always be combined with loan money. We think that some payback is necessary both to ensure efficiency of projects and also financial and fiscal responsibility on the part of recipients. It's important that grant money and loan money be combined and presented in one package, which is one reason why we would like to see that incorporated as part of the SRF program as opposed to being set up in a separate program.

Thirdly, we would also like to see SRFs have the flexibility to extend loan terms, as we now do with our State money. We go out as far as 30 years. It should really be the design life of the facility that you're funding that determines what is an appropriate loan term, and that's going to vary by project, it's going to vary by project component. Perhaps 30 years is not right for all States. It has worked very well for us. But we would also like to see that flexibility incorporated into the SRF program.

Basically, what I would like to emphasize is that the State portion of PennVest has a lot of flexibility that the SRF portion does not, and our experience has been with the many small systems that we have funded and have to address that the flexibility that we have has worked very well in addressing the financial needs and the funding needs of small systems, and we think that that same model can work in the SRF.

We would encourage the subcommittee to consider modifications of the SRF to build in that flexibility and, very importantly, to keep all of this within the context of the SRF. We think that's a model that works very well, that works very well across States, and we think it is able to be modified to accommodate the needs of small systems in rural areas that you're addressing today.

Thank you for this opportunity. That's all I have to say.

Mr. APPLGATE. Thank you very much, Mr. Marchetti, and all of you, for great testimony.

I have a question for Mr. Stafford which was submitted by Representative Valentine. He wanted to know this: Earlier testimony has emphasized the need for more flexibility at the local level. What sort of specifics do you recommend?

Mr. STAFFORD. Mr. Chairman, the first thing I would recommend is to maintain tax-exempt financing for local governments. This is a great aid to us as an additional tool for funding such infrastructure needs. Two, encourage us to cooperate with our neighbors and form regional service areas public-quasi-private partnerships;

three, as Congressman Synar mentioned, provide us with the technical assistance to comply with rapidly changing regulations; four, continue funding the State revolving loan fund program; and five, allow us to do more long-term, long-range planning at the local level and hold us accountable for this.

Again, I'll go back to the earlier testimony I gave, the word "sustainability," the problem of shooting at the moving target of the regulations. We need to have the ability to plan over a longer term than we have in the past.

Mr. APPELGATE. Okay. I thank you.

Mr. Ranson, let me ask you this question, because I think it's very important. Have you noted any environmental or any health problems that could be related to the lack of adequate treatment in a lot of the small communities? If so, has this affected the ability of West Virginia to attract industries into the area?

Mr. RANSON. I can't specifically identify health problems. I can tell you that we have measured, for instance, very high fecal coliform levels in streams in certain rural areas of our State. I have not spoken with our State health department people in terms of epidemiological data that specifically identifies health-related problems. There may be such data, but I don't recall having seen it. We could see if we have such information and provide it to you, sir.

Mr. APPELGATE. I'm not sure in my area that we could really come up with a figure, either, but we do have in my area, which I think pervades much of the rural and small town America, that it's very difficult to attract industries into an area simply because of the fact that you can't offer them the utilities that they need in order to operate an industry.

Mr. RANSON. That's an excellent point, sir. One of the other hats that I wear is responsibility for the economic development effort in our State, and in surveys the reason most often cited why we lose an industrial development prospect is lack of suitable sites. When you investigate that a bit further, at the top of the list is the lack of infrastructure—sewer, water, utilities, access roads, railroad, whatever—but lack of access to suitable water and waste water treatment is very high on the list.

Mr. APPELGATE. There's a point that I think you made that I want to try to understand what it is that you're saying, because I think it was covered a little bit earlier by Mr. Smith when he was here. You're saying you believe in grants and loans, but do I understand you saying that you should take a portion of State revolving funds to be used as grants?

Mr. RANSON. Fundamentally, we totally agree with those here and before who have said that a combination of a grant and a loan makes good sense, and we endorse the notion of administering whatever grants there are through the SRF framework. In addition to that, I suggested to you that it would benefit us if we could use some of the loan pool already allocated to us, but not yet committed, for those grants in the event that grants are reimplemented.

Mr. APPELGATE. Once that gets out, of course, that would be extremely popular. Wouldn't that deplete that fund very rapidly?

Mr. RANSON. Yes, sir, and there would have to be carefully thought out checks and balances and limits on that activity, certainly.

Mr. APPLGATE. Let me ask Mr. Stafford, I'm just sort of curious as to that plant that you were talking about. You said that you had built a plant in 1975 with the capacity of, I guess, about five millions per day at a cost of \$5 million and for 20 years of growth, and here you are 15 years later and you're only using half of it, and now the EPA is coming back and saying that it doesn't comply because of certain oxygen levels and that you can't add anymore people to that.

Mr. STAFFORD. That's correct.

Mr. APPLGATE. In other words, how large a community—

Mr. STAFFORD. Oh, 20,000.

Mr. APPLGATE. Is your community 20,000, or was it built to handle 20,000 or 40,000?

Mr. STAFFORD. It was built originally to handle a certain amount of gallons per day. That was its size limits. Before we reached the maximum capacity that it was originally designed for, due to tighter regulations than we had agreed upon originally or that we were attempting to comply with, we were issued a no-further-extension order, therefore limiting our economic growth with the other needs that we had. You know, communities don't sit still in America out here. They either go forward or they go backwards, and we were faced with what we thought was a time where we were looking at a backwards roll.

Mr. APPLGATE. You can continue to use the system now.

Mr. STAFFORD. Correct.

Mr. APPLGATE. But are you under a mandate that you have to make the changes?

Mr. STAFFORD. Yes, sir. We were, and we passed a bond issue. We did get some funding, the City of Sanford did, from the program for expanding that system, but we had to go back to the taxpayers for additional bond issues in order to increase the capacity, which also allowed us to comply with part of the EPA regulations, and we're now up and going again, although we did have about a two-year period that we could not use the system.

Mr. APPLGATE. Were you able to go to the State revolving fund?

Mr. STAFFORD. Yes, sir.

Mr. APPLGATE. Did you?

Mr. STAFFORD. Yes, sir. To my knowledge, yes, sir.

Mr. APPLGATE. How much did you have to ask from your bond issue?

Mr. STAFFORD. It was \$10.8 million from the bond, and I'm not sure on the loan program. I'm sorry. I can get that answer for you, though.

Mr. APPLGATE. Those are tax-exempt bonds?

Mr. STAFFORD. Yes, sir, and we're wanting to keep that status.

Mr. APPLGATE. Right. I agree with you on that. Well, okay. I was just very curious about that, and I do have some other questions I wanted to ask, but I will be submitting questions to perhaps each of you, and I would hope that you would be willing to answer those for us.

Mr. Boehlert?

Mr. BOEHLERT. Thank you very much, Mr. Chairman.

To my friends from county government, let me say as a former county executive, we're on the same wavelength. I can appreciate the problems you're facing.

Mr. RANSON, let me ask you, the examples you cited—Hanley, for example, a community of 660 people, where do they get the money initially just to hire someone to do the planning and the submission of an application? I mean, what would that cost for a project of the size required for Hanley?

Mr. RANSON. With your permission, sir, I'll let Mr. Johnson, who specifically administers the program, answer that. May I?

Mr. BOEHLERT. Fine.

Mr. JOHNSON. Sir, the town received funding through the Title 2 advancement allowance program, which we established back in 1984 as a means to help communities pay—

Mr. BOEHLERT. That's State funding?

Mr. JOHNSON. It's actually Federal funding coming through the Title 2 construction grant program.

Mr. BOEHLERT. Okay.

Mr. JOHNSON. So we use that program, rely on it heavily, to pay for preliminary engineering services such that that project could then be financed—

Mr. BOEHLERT. But how do they start? I mean, Hanley decides it's got a problem, and it's a very small community. What do they have to do, retain a consultant to come knock on your door?

Mr. JOHNSON. Yes, sir, that's usually the first step.

Mr. BOEHLERT. That costs them money to start with. See, I am so sympathetic to the plight of the Hanleys of America. I mean, the people look around and say, "We've got a problem. We've got to do something about it," but just to retain a consultant—and I'm not suggesting the consultants overcharge. They're very able professionals and have got to be paid for their services, but these small towns have a tough time just scraping together the money for the consultant, and that's a very iffy thing, because then you're just getting into competition.

Mr. JOHNSON. That's right, and usually my staff provides technical assistance to small communities, even in the negotiation of the engineering agreement.

Mr. BOEHLERT. All right. How about Florida and Pennsylvania? Can you tell us, Mr. Berryhill, in Florida do you provide technical assistance to these small communities?

Mr. BERRYHILL. At this point in our loan program, we do not, other than at the time the community receives their loan they do receive an allowance to help defray a portion of that upfront cost. Unfortunately, that does not come until after they have completed all of the design and the preliminary work, which is very expensive. This is a problem that we are currently addressing with a rule change, which we can do at the State level, and we are planning to start offering upfront loans for both the planning and the design phases of the project.

We have one form—being the good bureaucrats that we are, we have a form for everything—that we call a request for inclusion, and it's simply enough information that we can determine the financial needs of the community and assign a priority score to the project, because normally the demand for funds exceeds what we

have available. So we have to have a system to decide who gets the money, and we use a numerical scoring system to do this.

Mr. BOEHLERT. How about Pennsylvania, Mr. Marchetti? Do you do something? I hope I'm properly articulating it, but my concern is the Hanleys of America, a small community of 660 fine, decent people who have got a problem on their hands, and initially they've probably got to put out thousands and thousands and thousands of dollars just to get somebody to guide them in solving their problem, and that's a problem to start with. What do you do in Pennsylvania?

Mr. MARCHETTI. We have what we call an advance funding loan program where we provide financial assistance for design and engineering work or even feasibility studies. If somebody applies to us, we will give them a loan, and we can also work a grant into that funding, just to do the upfront work to get a community in the position to apply for a construction loan. We've been doing that for a number of years through the State program.

Mr. BOEHLERT. Do you think most States are doing that?

Mr. MARCHETTI. That I can't answer. I've heard of other States doing it. I don't know if most States do it.

Mr. BOEHLERT. Unless we're willing to concede that small town USA can just wither up and die, and I'm not willing to concede that, we've got to do something to help them.

Let me ask you this, and I'm not a technical man at all. That's why I'm on the Science and Technology Committee, which is my other assignment. [Laughter.]

Am I being naive, or is it possible to have sort of an off-the-shelf plan that can be used by Hanley and New Berlin, New York, and the communities around the country where you've got a problem, you've got 660 people in your community, and you pull off the shelf the standard design that would be applicable in probably 90 percent of the communities across the country of that size, absent any unusual geology or whatever? Is that possible, Mr. Marchetti, do you think?

Mr. MARCHETTI. I will demur somewhat, since I consider myself a financial person and not a technical person, but it's certainly true that a lot of the projects we fund are fairly standard in their design. Package treatment plans, for instance, which just basically have to be imported and put into place. I don't know that you can say that there is a standard design that's going to work everywhere. That's probably not a reasonable expectation. But I think there is a lot of consistency across these projects that would be applicable elsewhere, and I think probably there are simple designs that could be used in a large number of cases.

Mr. BOEHLERT. Well, Mr. Ranson, do you have any comment on that?

Mr. RANSON. Mr. Johnson and I were just conferring as we listened to Mr. Marchetti. It occurs to us that substantially for the town of Hanley and towns that size, there ought to be a relatively standard design for the treatment plant itself. Obviously, the distribution system is unique to whatever community, but a substantial part of the cost, of course, is the treatment plant, and to the extent that you could standardize a design for that and such, there ought to be an opportunity to do that. But finding the right loca-

tion, particularly in difficult terrain like ours, finding a suitable spot for that treatment plant is a bit of a consideration.

But it makes common sense, and I do have a bit of technical training, that there could be considerable standardization of treatment plants themselves, without question.

Mr. STAFFORD. Mr. Boehlert, to your question a minute ago, I would like to offer you a response to a package plant system that could go from one town to another and share with you this thought. We sent to our superintendent of public construction in North Carolina—this is a different but similar situation in that we were recommending to him that he gain some insight into some school sizes—a school size that would fit 500 people at an elementary level, and then a school size that would fit 1,500 students at a high school level. I'll tell you very quickly you run into, unfortunately, the architectural lobbyists and the engineering consultant lobbyists who would restrict—you would be hearing, as we have heard in the past, that they want to keep designs flowing of a multitude.

Mr. BOEHLERT. I'm very mindful of their need to make a buck, and I don't want to deprive them of that opportunity, but, boy, small town USA is hurting—

Mr. STAFFORD. I understand and agree.

Mr. BOEHLERT [continuing]. And in so many instances we force them to buy a luxury vehicle when a compact car might do the job. I mean, the education example, you drive through my neck of the woods in upstate New York, and I can tell you almost to the year when a high school was built, particularly those schools that were built WPA. You know, 1936, 1937. There's a standard design all across America, because the Roosevelt Administration—I'll give a plug to the opposite side—wanted to get people back to work, and they had that standard design. So I'm looking for something similar for the small communities of America, and I guess we're all on the same wavelength.

I just want you to know I appreciate your testimony. It will be very helpful to us, and we're going to be working very hard to, one, give you more flexibility, because you need more flexibility. The last thing you need is some bureaucrat on high in Washington dictating chapter and verse everything you have to do. Secondly, accompanying the mandates, we'd like to give you a little money to help you pay the bill.

Thank you very much.

Mr. APLEGATE. Thank you, Mr. Boehlert.

Of course, as always, we save the best for last. The gentleman from West Virginia, Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman.

I'd just say to Secretary Ranson in response to that last question from the gentleman from New York that in regard to the lack of proper space to build these facilities on flat land, the way that Director Callaghan has been issuing mountain top removal permits, I would think we're going to have sufficient land in West Virginia to build these types of facilities. [Laughter.]

Let me ask a question to you, Mr. Secretary. Do you feel that small, low-income communities can benefit from the use of alternative or non-traditional technology, such as land application or

natural or constructed wetlands, as opposed to depending on the modern, high-tech technology?

Mr. RANSON. Yes, sir. I'm enthusiastic about those particular technologies and perhaps others. There is a rapidly growing body of technical data supporting the notion that wetlands, for instance, can be very effective in terms of cleanup, and to the extent that that makes sense technically and to the extent that it's environmentally responsible, I think we ought to look carefully at it. It's particularly suitable for small communities where the waste load is relatively modest, particularly if there are wetlands available or even can be created for that purpose, land application of sludge. We know sludge is, in all probability, something that needs to be controlled very carefully, but that material does have a nutrient value, and so long as the content of it is carefully monitored, it seems to me to be a reasonable balance of environmental management and cost control.

Mr. RAHALL. Besides the cost of a system, I know another problem that small communities face is just basic know-how. They generally rely on elected officials who volunteer their services, as you well know, and cannot afford to employ an engineer to fully plan and operate the system. How useful are organizations such as the Rural Water Association or the Rural Community Assistance Programs, known as the Community Action Commissions in West Virginia, in assisting small communities with the planning and the operation of a system?

Mr. RANSON. With your permission, I'd like to let Mr. Johnson react.

Mr. RAHALL. Sure.

Mr. JOHNSON. Sir, we in fact have monthly meetings with other State and Federal funding agencies involved with not only the funding of these projects, but also the operation and maintenance involved with those facilities. We certainly would like to do more. Speaking from my staff's standpoint, we believe that the small community in West Virginia is our employer. That's who we work for. So we're going to provide them as much technical assistance and administrative assistance as we can in helping them to implement one of these projects.

Mr. RAHALL. So these organizations or commissions do play a vital role in this process.

Mr. JOHNSON. Yes, they do. We all work together.

Mr. RAHALL. Thank you.

Yes, Mr. Secretary?

Mr. RANSON. May I add to that, sir? One of the recommendations we made was to consider increasing from 4 percent to, let's say, 5 percent the amount of SRF money that could be used for administration. The primary reason for that recommendation would be to allow us to increase the amount of technical assistance that we're able to provide to those small communities.

The Vice Chairman made reference to the problem of small communities often having difficulty even accessing a consultant to help them with the very fundamental preliminary work that has to be done. It occurred to us that with a little bit of flexibility in terms of what administrative monies can be used for, in the case of West

Virginia in particular, we might be able to provide some of that out of our offices and do it real efficiently.

I'm also impressed with the Pennsylvania model and will be wanting to get more information about that.

Mr. RAHALL. Thank you.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you very much, Mr. Rahall.

[Subsequent to the hearing, additional questions were submitted to Mr. Marchetti and Mr. Rice by Representative Bud Shuster. The questions and responses follow:]

Honorable Bud Shuster  
U.S. House of Representatives  
Committee on Public Works and Transportation  
Suite 2165  
Rayburn House Office Building  
Washington, DC 20515

Dear Congressman Shuster:

I am writing in response to your March 2 letter transmitting some questions that you wished to ask concerning my February 24 testimony before the Water Resources and Environment Subcommittee. I appreciate your interest in this testimony and the wastewater treatment needs of small and rural communities. I apologize for the delay in my response, but I only received a copy of your letter last Friday.

Your questions, and my answers, are as follows.

- Q. You indicate that PennVest's criteria for evaluating applications for aid are (1) the severity of health threat and (2) the potential for economic stimulation. What about the credit worthiness or economic needs of the applicant? Do either of these criteria factor into your calculations?
- A. The economic needs and conditions of our applicants enter into our analysis when we are determining the amount and type of financial assistance to provide those who rank high enough for funding. Our legislation does not, however, provide for the use of economic conditions as a ranking factor to use in the project selection process.

When we provide financial assistance to our borrowers, we determine the terms of that assistance by estimating a target user rate that we believe the project's users can reasonably afford to pay. This target user rate is calculated by considering:

- o median household income
- o the percentage of the population over age 65
- o the percentage of the population having

- o incomes below the poverty level
- o the rate of population change in the community
- o the broad range of local economic conditions, as measured by the Department of Community Affairs index for local economic distress

Depending upon a community's scores on these factors, we will offer assistance ranging from a fully funded 1 $\frac{1}{2}$  loan for thirty years and a \$250,000 grant, to partial funding of the applicant's request at the maximum interest rates that our legislation will allow.

The fact that we are willing and able to offer only partial funding to those communities who we believe are financially better off allows us to stretch our financial resources to include more projects than we would be able to otherwise. We are hopeful that we will soon be able to work with the Department of Commerce to provide market rate financing as a part of the package offered to these better-off communities. This will allow us to further stretch our funding resources to reach even more applicants.

While our ranking system is based on public health, environmental benefits and job creation, we have nonetheless been able to accommodate the majority of financially stretched communities who have applied to us. Due to their lack of financial resources, these also tend to be the communities with the most severe wastewater treatment problems since they are often forced to postpone corrective actions for lack of funds. Consequently, they tend to find their way to the top of our rankings.

- Q. Some have advocated "leveraging" to capture additional capital to fund needed projects. Are there any current impediments to this approach that need to be removed? Are there incentives that should be added?
- A. The only modification that I would suggest regarding leveraging would be to allow states to combine funds that they use for other infrastructure financing with SRF funds.

For example, in Pennsylvania we run a large state-funded water and wastewater loan financing program in conjunction with administering the SRF. Under current rules, we must entirely segregate our state funds from our SRF funds. In order to leverage both our state and federal programs, we would have to issue two separate series of revenue bonds, incurring issuance costs twice and having two pools of loans pledged separately to each series of bonds.

It would be more efficient for us to be able to combine the repayments from all of our loans into one pledged pool, whether the underlying loans originate from state or federal funds. This would reduce issuance costs and would also create a larger pool of loans to provide security for our revenue bonds.

The combining of funds suggested here should include both state and federal funds for wastewater as well as drinking water. Concern for protecting the funding of particular types of projects could be accomplished by accounting for the monies devoted to each type of project within the combined fund, but still allowing for all of the loan repayments to be jointly pledged to the repayment of the same revenue bonds.

The modification suggested here would be of most benefit to programs that are smaller than Pennsylvania's. PENNVEST is already so large that we have captured most of the efficiency gains that would accrue from the suggested combining of funds. States with smaller programs, however, would benefit from the efficiency gains and would be better able to address the funding needs of smaller, less creditworthy communities by including them in a larger pool of pledged loans.

Q. Has Pennsylvania looked at privatization options for wastewater treatment construction or operation and maintenance?

A. I know that there are some groups in Pennsylvania interested in encouraging privatization, but PENNVEST is limited in its ability to provide assistance for such efforts. Current rules restrict our assistance to publicly owned treatment works. In addition, federal tax law limits the amount of tax exempt financing that can be provided to privately owned facilities.

I am hopeful that the legislation allowing us to work with the Department of Commerce on providing partial funding to applicants (see A. 1 above) will be enacted in the fall. We anticipate that this legislation will also allow us to provide more financial assistance to privately owned wastewater and drinking water systems. This would include efforts to privatize existing publicly owned systems.

Sincerely,

Paul K. Marchetti  
Executive Director

Dear Congressman Shuster:

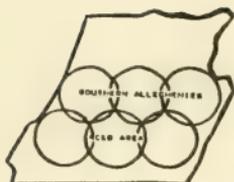

First I need to apologize for not answering your questions. I was not aware you had ask for this information till one of your staff called Ron Donland, the RC&D Director, last week and he in turn called me.

Please find enclosed answers to your questions and a proposal for passive treatment of sewage and acid mine drainage on the Little Conemaugh River in Cambria County which is part of the six county region Southern Alleghenies RC&D area. To our knowledge, this is the only such proposal we know of in the Eastern United States. We believe it will work.

If we can be of further help, please do not hesitate to call me at 623-4807 or Ron Donland at 623-7900 or write and we will respond immediately.

Sincerely,

Dick M. Rice

(814) 623-7900

O. On the last page of your testimony, you mention a possible treatment system for both sewage and acid mine drainage. Could you elaborate? Would this effort involve any innovative or alternative treatment (or pollution prevention) technologies?

A. Researchers involved with the construction of passive treatment systems for sewage and acid mine drainage point to the need for an experimental project to demonstrate a combine sewage/AMD treatment system.

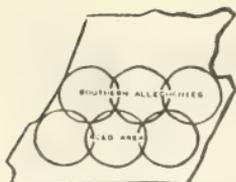

Researchers in Florida notice dramatic removal of phosphorus from secondary treated sewage effluent when combined with waters naturally high in iron. Iron and phosphorous will precipitate quickly as an iron phosphate mineral at a 1:1 ratio.

It has also been well documented that wetlands are great at reducing biochemical oxygen demand (BOD), and good at removing nitrogen.

According to the U.S. Bureau of Mines, secondary treated sewage effluent will increase the activity of sulfate reducing bacteria needed to remove metals and raise the pH of acid mine drainage.

A project near the Boro of Lilly in Cambria County has been identified as currently the best in our six county region to demonstrate the effectiveness of a combined sewage/AMD treatment system. If successful, this new technology could be applied in other locations from the Broad Top in the Southern Alleghenies to all states impacted by coal and metal mining.

As of this time, the Bureau of Mines is unaware of the existence of any sewage/AMD treatment systems in the United States.

**SOUTHERN ALLEGHENIES  
RESOURCE CONSERVATION AND DEVELOPMENT  
AREA**

702 West Pitt Street  
Fairlawn Court  
Bedford, Pennsylvania 15522  
(814) 623-7900

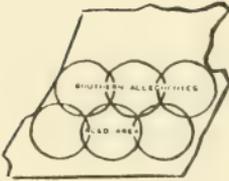

Q. What role, if any, should the Army Corps of Engineers have in addressing small and rural community infrastructure needs? Would the Corps, EPA, or some other agency be the best to administer programs involving technical assistance or other demonstration programs?

A. The Southern Alleghenies Resource Conservation and Development Council recognizes the valuable contributions made by the U.S. Army Corps of Engineers (USACE) in our area. Raystown Lake not only provides flood protection, but also supports a major tourism and recreation industry. USACE is also helping us study the problems and potentials of the Conemaugh River Basin.

However, we are concerned that USACE may not be the most appropriate agency to address small and rural community infrastructure needs. USACE procedures have been developed to conform to their previous authorities dealing with large projects such as Lake Raystown. It is extremely important that projects like Raystown be scrutinized to minimize their adverse environmental impacts. The USACE is also required to determine that the project's costs are exceeded by its benefits, in order to justify expenditure of federal dollars.

Small community infrastructure needs and water quality improvements should not require the same type of analysis. They do not consume large areas of wetlands or prime farmland; nor do they impound free flowing streams, altering flow regimes often vital to species downstream. Furthermore, water quality improvements in small communities often address long-standing historical degradation from mineral extraction, sewage disposal, and other activities. Restoring water quality to acceptable standards has positive cumulative downstream impacts that are difficult to quantify in terms of economic benefits.

USACE's requirements to do detailed cost benefit analysis, local and regional economic assessments, and other studies represents overkill. In many cases several projects could be accomplished for the cost of the studies. Such studies also place an additional (often unbearable) level of financial burden on local sponsors who are required to share 50% of the cost of USACE's studies. This process also tends to usurp local and regional authority. Small and rural community infrastructure needs have most likely already been studied by the local township supervisors, planning commissions, conservation districts, Southern Alleghenies Resource Conservation and Development Council, and other appropriate agencies and consultants.

We suggest that consideration be given to vesting the Resource Conservation and Development Councils with the administration of programs involving technical assistance or other demonstration projects. Resource Conservation and Development Councils interact with other local and regional groups, and are in an excellent position to determine which agency can best respond to rural needs. For example, combined treatment systems for both sewage and acid mine drainage might best be handled by the U.S. Department of the Interior Bureau of Mines or the Office of Surface Mining. On the other hand, non-point agricultural pollution control projects such as the Evitt's Creek Watershed or Upper Raystown Watershed would best be handled by an agency such as the Soil Conservation Service, which deals regularly with farmers in the installation of best management practices. Other projects may require a holistic approach utilizing several different agencies.

Resource Conservation and Development Councils such as ours in the Southern Alleghenies are unique in their capability to work cooperatively with local, state, and federal agencies to solve problems of regional importance. The Southern Alleghenies Resource Conservation and Development Council would eagerly seize the opportunity to assist in maximizing the effectiveness of limited federal water resource dollars.

Because water quality improvement is often best accomplished by comprehensive projects involving expertise from several agencies traditionally confined to specific problems (i.e. mining, agricultural, industrial, sewage) it is important to be able to call on whichever agencies are most capable of addressing each problem. Furthermore, it is also critical to avoid the 50% cost sharing, which puts most significant projects out of reach of small rural communities.

LITTLE CONEMAUGH RIVER  
CAMBRIA COUNTY, PENNSYLVANIA

PROPOSAL FOR PASSIVE TREATMENT  
HUGHES NO. 2 BOREHOLE

I. HISTORY OF SEWAGE PROJECT

The Lilly/Cresson area in the headwaters of the the Little Conemaugh River has water quality problems from old acid mine discharges and untreated sewage being discharged directly to the river. This proposal is designed to address both pollutants through the construction of a 0.3 mgd, sewage treatment plant and artificial wetlands to recieve the STP effluent and treat AMD from a large borehole discharge.

The project began in June of 1992, with a meeting of the representatives of Lilly and Cassandra Boroughs and Washington, Cresson and Portage Township. The municipalities each had development constraints or Clean Streams Law compliance issues related to the lack of public sewage treatment.

Untreated sewage discharges exist in each of the municipalities. Each municipality has had to deny building requests both individual, residential and for housing and commercial subdivisions. Much of the area is unsuited to on-site treatment of sewage.

The area is located in the headwaters of the Little Conemaugh River and two tributary streams, Bear Rocks Run and Benscreek. The streams each are affected by AMD to some extent within the project area, although some aquatic life, including fish are present throughout the project area. Removal of raw sewage discharges is anticipated to improve the aquatic habitat for the affected portions of stream, primarily by reducing biologic oxygen demand (BOD). There will also be obvious public health benefits from removing the raw sewage discharges.

II. AMD TREATMENT PROJECT

The farthest point downstream in the Act 537 Plan service area is the community of Oil City. The treatment plant is proposed to be located immediately below that community.

Approximately one half mile below this site is a borehole (through a filled in shaft) discharge from the Hughes No. 2 Lower Kittanning deep mine. This mine is abandoned, although the successors still own extensive real property interests in the area.

The borehole discharges a high iron and aluminum, low pH stream of water that varies between 1,000 gpm and 3,500 gpm depending on seasonal water tables. The discharge has caused accretion mounds of iron to be deposited around it and covering an area of approximately (3) three acres. No aquatic life exists below the part where this discharge enters the Little Conemaugh River. Minnows and other aquatic life exist immediately up stream of the discharge.

This discharge is one of the 8 large deep mine discharges documented in the 1968-1972 EPA study of the Upper Kiskimetas river basin which are responsible for over 90% of the pollution load in the Little Conemaugh River system. It is the uppermost significant discharge in the watershed. Successful treatment of the discharge would restore aquatic life to more than 3 miles of the Little Conemaugh River.

The borehole is located within the flood plain of the Little Conemaugh River. The floodplain in this area comprises approximately 50 acres of ground below the discharge and 30 acres of ground upstream from the discharge. See Figure 1 for a map showing locations. The location is suitable for construction of a series of shallow ponds for AMD metal removal.

III. TREATMENT PROPOSAL

The sewage plant and collection system cost has been estimated in the Act 537 plan at between 10 and 12 million dollars. Steps are underway through the Central Mainline Sewer Authority to secure FHA funding for the project. The sewage treatment plan is marginal but possible with the high level of commitment from a majority of the local elected officials of the five municipalities.

The waste water treatment plant would discharge nutrient rich water as its effluent approximately ¼ mile above the borehole. The borehole itself is located in a flat flood plain area in which a series of shallow ponds could be excavated, and wetland plants established for passive buffering and metal removal. Literature on passive wetlands indicates that organic material used to create the wetland is eventually consumed by oxidation and microbial action during the process of removing iron and buffering pH. The effluent from the plant could provide a continuing source of organic material and renewal to the wetlands. Because STP effluent typically has a much higher pH than AMD, the effluent will also enhance the precipitation of aluminum, iron and manganese and removal of trace metals in the ponds.

The passive wetland system would include ponds and basins covering approximately 70 acres, a low wall along the Little Conemaugh River to prevent a channel being cut into wetlands area, some stream relocation, and one half mile of effluent pipe and a bore under a 200 foot wide railroad embankment. Rough costs of such a project would be (7) seven million dollars.

\$2,500,000	earth moving
\$ 100,000	clay basin liners
\$ 500,000	wetland substrate (placement & mixing)
\$ 600,000	lime stone diversion wells (3)
\$ 300,000	access roads to diversion wells
\$ 700,000	re-drilling new boreholes, grouting old shaft
\$ 750,000	retaining wall ¼ mile
\$ 500,000	pipeline c boring

\$ <u>125,000</u>	stream relocation
\$ <u>50,000</u>	habitat improvement in stream
\$ <u>100,000</u>	flow control at discharges
\$ <u>100,000</u>	wetland plants & planting
\$ <u>125,000</u>	rip rap, limestone substrate
\$ <u>100,000</u>	water quality monitoring
\$ <u>200,000</u>	engineering design
\$ <u>200,000</u>	engineering inspection
\$ <u>100,000</u>	misc. administration (audit, legal, etc.)
\$ <u>200,000</u>	property acquisition (treatment and access for public use after completion)
<u>\$7,250,000</u> TOTAL	

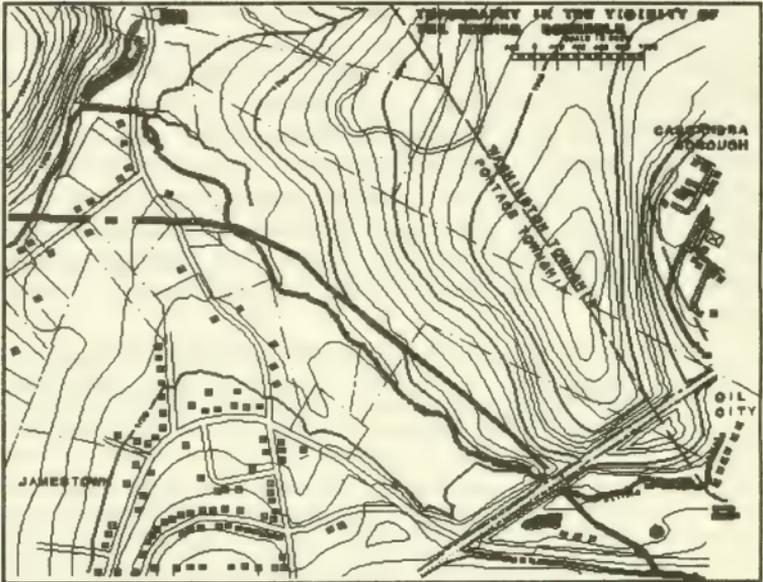

The next large AMD discharge point is near the Portage Sewage Treatment Plant downstream of the Borough of Portage, more than 3 miles (along the River) from the Hughes site. The river and two tributaries (Noels Creek and Benscreek) contain a substantial and varied aquatic life including native brown trout populations which will re-colonize the three mile portion of the Little Conemaugh River almost immediately. Public access for fishing, canoeing and hiking would be obtained as part of the property acquisition process.

Operation of the facilities would include three components:

1. Operation of the STP by the Central Mainline Sewer Authority to secondary treatment standards as set forth in an NPDES permit, measured at the discharge into the wetlands.
2. Monitoring, cleaning and refilling with limestone of a tumbling device to treat the AMD discharge. A limestone stockpile would be maintained on-site through a contract between the DER and Department. The ideal solution would be a cooperative effort with the local sewage plant, as an alternative local Sportsmen's groups have indicated a willingness to check and fill the tumbler. The County of Cambria could provide back-up through its park department.
3. Ponds and basins will have to be checked for integrity on a regular basis. Repair and maintenance of the ponds would be worked out with the Sewage authority.

This proposal is put forward by the StoneyCreek, Conemaugh River Improvement project and the Little Conemaugh Project being carried out by the Cambria County Conservation District and the Cambria County Mineral Assessment Office. Discussions have been had on a preliminary basis with the two major landowners and members of the Central Mainline Sewer Authority. If there is an interest in funding such a project specific agreements, allocations of responsibility for maintenance and negotiations on responsibility for the AMD site can be worked out. The cost figures set out above contain costs associated with moving the STP one half mile down to the downstream side of the railroad embankment. Some of the project funds would be expended in defraying this cost to the STP.

Figure 1

Mr. APPLEGATE. Well, it seems to me, after two days of hearing people coming in representing the various States and expressing their views, that we're all pretty much singing the same tune and pretty much the same lyrics, with maybe just a slightly different beat on some of them, but I think pretty much uniform in thought, and it's obvious that something has to be done to help small town America and rural areas to meet these mandates and perhaps to even soften some of the time requirements and all.

It's going to be a big job to come up with something that's going to be applicable to everybody. We can't do that. But to be agreeable with everybody is also going to be very difficult, but it's something we're going to have to do if we're going to get something passed. So we'll be looking forward to future meetings in the next few weeks. We'll be setting forth some additional meetings trying to find out what direction it is that we need to take.

I think it's been pretty much expressed that we need a grants program and we need a continuance and an increase in the loan program, and the two to work together, and to help provide for management, technical assistance, as well as the construction needs in order to meet what it is that the EPA has set forth upon the Nation.

So we will be looking forward to more of your input, and I personally want to thank you very much for taking time out of your very valuable and busy schedules to come before the Congress, before the committee, and give us your ideas and views. Thank you very much.

[Whereupon, at 12:20 p.m., the subcommittee adjourned, to reconvene subject to the call of the Chair.]

PREPARED STATEMENTS OF WITNESSES

---

STATEMENT OF DON BERRYHILL, FLORIDA

DEPARTMENT OF ENVIRONMENTAL REGULATION, DIRECTOR OF LOCAL  
GOVERNMENT FINANCIAL ASSISTANCE PROGRAM

The Florida DER is divided into six districts. The district that I represent has 19 counties with eighteen of those 19 counties classified as small. Populations range from approximately 100,000 people in Clay County to less than 10,000 people in Gilchrist County. There are pockets of unemployment which are some of the highest in the state, such as in Taylor County, and a fairly high percentage of the population is under the poverty level. The people have a desire to protect their environment, but finances are limited, and they are unable to provide and maintain a modern wastewater treatment facility.

The problem that many of the existing wastewater plants have is twofold: first, many of the municipal plants have not set aside sufficient funds for capital expenditure because of the need to key the rate structure within the income level of users. These plants generally have not been upgraded with modern technology so operation and maintenance costs are high. Many of the cities must fund the operation

of plants from other municipal funds. It is generally accepted that wastewater utilities are not self supporting. The other complication with existing facilities is the wastewater collection infrastructure. As collection systems age, the pipes get out of alignment or deteriorate which allows groundwater to enter the pipes and results in infiltration. Another problem is that connecting structures, such as manholes, can fail and allow surface water to enter the system during rainfall events. This is known as inflow. Both infiltration and inflow (I&I) can tremendously add to the treatment cost by reducing the capacity of the treatment plant. The facility will not only be treating wastewater, but also groundwater and surface water.

For existing plants, capital improvement money is necessary to repair collection systems to reduce inflow and infiltration. Moreover, capital is needed to modernize wastewater treatment plants to reduce the operation and maintenance cost and meet environmental standards. However, the utility rate structure must be able to provide and set aside funds necessary to provide capital improvement.

While inflow and infiltration presents a formidable cost obstacle, the need for new sewage treatment plants presents an equal challenge. Some communities have experienced slow

growth patterns, thus regional sewage systems have not been established. There are communities now with populations large enough for a wastewater treatment system but do not have the financial stability to provide that service. Private enterprise is not very interested in these systems because there is limited potential for profit.

Two criteria should be used to determine the need for municipal treatment systems. The first and foremost concern should be public health. If private on-site sewage systems are failing due to a high groundwater table and geological features, then a municipal system would provide a greater level of protection for the citizens. Secondly, environmental or natural resource issues may require the construction of a municipal system. An example of this is a small town on the gulf coast which had all residents on private individual systems. These systems were failing due to high groundwater. The offshore shellfish beds were closed due to high bacterial counts and a six million dollar annual business was lost. Luckily, with help from the federal government, a grant and loan was secured to build a municipal system and the potential to recover that lost industry was provided. The federal grant was necessary to keep the service fees low enough so that the citizens could afford the utility.

The two wastewater problems that are apparent are the need to put capital into existing systems to modernize the treatment system and repair the collection systems and secondly, the need to build new treatment plants where public health or environmental resources are in danger.

These small communities have to treat their wastewater to the same degree as do major municipalities, but they do not have the tax base to support the modern technology and equipment needed.

In dealing with the citizens of these small communities I've learned that they are sincere, dedicated, hard working people. They really want to do what is right, the money just isn't there. As we provide them with the resources they need, we will be protecting the environment not only for them, but for all of us.

## Testimony by

J. Dale Givens, Assistant Secretary  
Louisiana Department of Environmental Quality  
Office of Water Resources

February 24, 1993

Mr. Chairman, members of the committee, good morning! My name is J. Dale Givens. I am the Assistant Secretary for the Office of Water Resources of the Louisiana Department of Environmental Quality (LDEQ). The purpose of my testimony this morning is to explain the problems we face in Louisiana with trying to get rural communities into compliance with Federal and State environmental regulations concerning sewage treatment.

Improperly treated or untreated discharges of sewage are a significant cause of water pollution and can be a source of human health problems for those who use the water bodies that receive the waste water. As you are aware, proper treatment and disposal of sewage is required by regulations of the U. S. Environmental Protection Agency. The State of Louisiana also has similar regulations. While designed to protect human health and the environment, these regulations often result in the need to construct expensive waste treatment systems and supporting infrastructure such as collection systems to transport the waste water to the treatment facility. Waste water treatment needs surveys have indicated the need for facilities and collection systems at a cost in excess of one billion dollars in Louisiana.

Financing projects that require major expenditures of capital can be very difficult for large cities that have a significant tax base. Financing such projects by rural communities that have a very limited tax base can be impossible without an outside source of funding. In addition to tax dollars, funding for these types of projects is usually limited to funds from one of the following: A) State Revolving Fund (SRF) loans, B) CDBG grants and C) Farmers Home Administration (FHA) which has a loan program and limited grant capability for poor communities.

The SRF loan program is providing critically needed funding to both large cities and smaller cities and towns. However, constraints placed on the program by federal regulations makes it very difficult for some communities,

(J. Dale Givens page 2)

large and small, to obtain funds from this program (Title II requirements, affordability, etc.). Many communities simply cannot afford a loan from this program even though Louisiana currently has recently established an interest rate of 2.95% for these loans to try and make them more attractive.

The CDBG program is often turned to by small and rural communities for funding for waste water treatment projects. In FY 92-93, fifty seven communities applied for CDBG funding for waste water treatment projects. Only ten projects were funded (18 percent). The program, at least in Louisiana, has a cap of \$750,000 per project.

Community	CDBG Grant
	Amount
Abite Springs	\$626,288
Bonita	\$399,997
Cheneyville	\$219,993
DeQuincy	\$740,300
Independence	\$750,000
Mermentau	\$405,216
New Llano	\$750,000
Newelton	\$749,538
Oakdale	\$269,670
Ringold	\$435,067
<b>Total</b>	<b>\$5,346,069</b>

As more communities attempt to come into compliance with the environmental regulations, the demand on this source of funds will increase and the program cannot keep up with the need at the present funding rate.

The LDEQ assists the State Division of Administration with the CDBG program by ranking the proposed projects each year. Factors used in determining the ratings include Affordability, Enforcement History and Environmental and/or Human Health Impact. In order to attempt to help the smaller communities LDEQ, this year, modified the factors used to rank the projects and assigned a factor of 1 to 10 for affordability with 10 indicating that the community could not afford to implement the project. That factor was then multiplied by 0.60 to determine the affordability weighting for the project (affordability became 60% of the Final Rating). The affordability factor was determined by working with the Department's Municipal

(J. Dale Givens page 3)

Facilities Division (the program area that operates the SRF program) and using their formulas for this purpose.

The Farmers Home program, while being a last resort for funding that has rescued many small or rural community waste treatment projects, cannot begin to make up the difference for waste water treatment projects that cannot obtain funding from either the SRF or CDBG programs. Clearly, additional funding and funding mechanisms are needed to aid the rural and small communities.

Although not a steady or reliable source of funding, the LDEQ's Office of Water Resources (OWR) has recently began encouraging companies that are in negotiation concerning an environmental penalty assessment to consider dedicating all or a portion of the settlement amount towards projects in the local community where the alleged violations occurred. An example of such a settlement agreement is a case where a \$60,000 settlement is being dedicated to a community for the construction of a new lift station to help provide sewage collection and treatment for an unsewered section of the town. The LDEQ/OWR has also entered into a Memorandum of Understanding with the U. S. EPA's Region VI concerning enforcement activities whereby communities that are under compliance orders from EPA for violations concerning waste water treatment can receive extended compliance schedules if they are planning to fund the project through the SRF program. This is to allow for the extra time required to meet the requirements of that program. Perhaps, this same concept could be extended to communities awaiting funding through CDBG or other grant or loan programs.

The sewage treatment needs of Louisiana communities as is the case with many communities nationwide is great. The obstacles to funding these projects, particularly with regard to the small or rural community can be overwhelming. Your assistance in helping to provide a mechanism that includes additional funding and less red tape to qualify for the funding and to construct the project will be greatly appreciated.

Statement of

Paul K. Marchetti

Executive Director  
Pennsylvania Infrastructure Investment Authority  
Commonwealth of Pennsylvania

and

Vice President  
Council of Infrastructure Financing Authorities

Before the Water Resources and Environment Subcommittee  
of the House Public Works and Transportation Committee

Washington, DC  
February 24, 1993

Good morning. I am Paul K. Marchetti, Executive Director of the Pennsylvania Infrastructure Investment Authority (PENNVEST) and Vice President of the Council of Infrastructure Financing Authorities (CIFA).

In both capacities, I have experience with the funding of wastewater and drinking water projects in small communities and rural areas. This experience is the basis for some suggestions for how the State Revolving Fund (SRF) program might be modified to better address these funding needs in the future.

PENNVEST was created by Governor Robert P. Casey in 1988 to address the pressing water quality problems that plagued Pennsylvania at that time. The Commonwealth led the nation in cases of water-borne disease and a third of our sewer systems were under connection bans or limitations. These conditions were not only environmental concerns but also inhibited economic growth and

job creation across the Commonwealth. The Governor saw PENNVEST as a mechanism for addressing both of these issues simultaneously.

PENNVEST was initially capitalized by \$1 billion in funding for both drinking water and wastewater projects. Approximately three fourths of the capacity came from the state, with the balance coming from the federally funded SRF. Much of the state's contribution, and all of the federal contribution, is comprised of revolving funds that are used to make loans whose repayments remain with the PENNVEST program. Thus, we are also able to issue revenue bonds to finance additional projects in the future (\$142.5 million have been issued to date).

Pennsylvania's voters in 1992 added an additional \$350 million in state borrowing capacity to fund more projects. This referendum also expanded PENNVEST's financing authority to include storm water projects.

PENNVEST was created to serve the clean water financing needs of all Pennsylvanians, with a particular emphasis on small systems and rural areas. Pennsylvania has approximately 2,500 community drinking water systems and almost 4,000 wastewater systems. Seventy-five percent of these systems are small (defined as having fewer than 1,000 connections). Taking drinking water systems alone, approximately 85 percent are small. Pennsylvania also has the largest rural population in this country. Of our 67 counties, 55 are considered rural (defined as having a population of 200,000

or fewer).

PENNVEST financial assistance is comprised primarily of low-interest loans, although a small amount (five percent) is grants. The interest rates on our loans range from a minimum of 1.0 percent up to a maximum of five to six percent, depending upon prevailing market interest rates and other economic conditions. We average about 2.2 percent. For any individual project, we can provide up to \$250,000 in state funded grants. However, we never allow grants to constitute more than 50 percent of our assistance to a project. We will also extend the term of our loans to 30 years in cases where even a 1.0 percent loan and a maximum grant is not enough to make a project reasonably affordable. We can, of course, only do this with state funds.

The interest rate that we charge a borrower, as well as the amount of grant funding, if any, that we provide, is determined by a comparison between the costs of a project and the financial capability of the project's users to pay for it. Smaller, more economically disadvantaged communities will receive proportionally larger interest rate and grant subsidies than will other borrowers, simply because the typical water or sewer project is large and expensive relative to the user base available to repay our loan.

Since its inception in 1988, PENNVEST has provided \$1.082 billion in funding to 656 drinking water and wastewater projects across the Commonwealth. Of these funds, \$349 million (32 percent)

have gone to small systems, which comprise almost 60 percent of the total number of projects we have funded. These systems have also received 79 percent of our grant funds. From a slightly different perspective, \$498 million of our assistance (46 percent) has gone to rural areas. Fifty five percent of the projects we have funded are in these areas. This is not to say that urban areas have been neglected by this program either. For example, we have made a \$20 million loan offer to the City of Philadelphia. Other urban areas in the Commonwealth have received similarly large loans from PENNVEST.

In addition to the environmental benefits that PENNVEST has created across the Commonwealth, the program has also helped create 13,500 permanent jobs in this state, in addition to approximately 41,000 direct construction jobs.

As I said earlier, PENNVEST was designed to address the water quality problems of all Pennsylvanians, with a particular emphasis on small systems and rural communities, due to their prevalence across the Commonwealth. As our experience shows, this program design has worked extremely well. Two provisions in our enabling legislation greatly contributed to our being able to focus the program on small, rural communities. First, total assistance available for any individual project is limited to \$11 million, unless a project serves multiple municipalities, in which case assistance can go as high as \$20 million. Only in limited circumstances can total assistance to any single project be raised

above this level. Second, and more importantly, our project ranking and selection process is independent of system size. Consequently, small systems stand on an equal footing with larger systems in our evaluations. It is the severity of the public health problem being corrected, as well as the potential for economic development that will be stimulated, that determines an applicant's chances of being funded.

There are some other aspects of the PENNVEST program that warrant consideration by this subcommittee for modifying the SRF program to better address the needs of small systems and rural communities. I recommend this subcommittee's consideration of these suggestions, both as Executive Director of PENNVEST and as Vice President of CIFA. These programmatic modifications have worked to the benefit of small systems in Pennsylvania. As CIFA has pointed out in various contexts, we also believe that they could work equally well in other states if the SRF were changed to allow for them.

#### Extension of SRF Program to Drinking Water

There are many small communities in Pennsylvania and other states struggling to comply with the provisions of the Safe Drinking Water Act. PENNVEST has been using funds to help such systems since 1988. In many other states, either the political commitment or financial capacity to do this has not been present. Even in Pennsylvania, despite our large commitment of state

financial resources, we still face a considerable backlog of unfunded drinking water projects.

Expansion of the SRF mechanism to include drinking water would provide a tremendous benefit to all the states. We welcome the Administration's recent proposal to do this.

#### Loan Principal Write-Down

In cases where even a zero interest loan will result in user rates that are excessive relative to project users' ability to pay, states should be able to write-down a portion of the SRF loan principal as a grant. Similarly to how PENNVEST provides grant funds, however, there should be restrictions imposed on how states do this, in order to maintain the financial viability of the SRFs. Absolute dollar caps should be considered. At a minimum, there should be a limitation on the percentage of a project's financing that can be comprised of grant funds (however these funds are provided). In order to ensure long-run financial responsibility and project design and maintenance efficiency, some loan pay-back should always be expected of SRF recipients. As stated above, PENNVEST always requires at least 50 percent loan funding in the assistance that we provide for any project. While this may not be the appropriate percentage for all states, some similar expectation should be considered for the SRF.

#### Extended Loan Payback

In cases where the user rate that will result from an SRF project is higher than what is reasonably affordable, states should be allowed to extend the term of their SRF loans beyond 20 years. In PENNVEST, we will go out as far as 30 years. I suggest this as a reasonable maximum although, again, the needs of other states may differ. A reasonable standard for the loan term maximum is the design life of the facility being built. Whatever maximum term is chosen, this allowance for some extension beyond the current limit of 20 years would help ease the financial burden facing small system users.

I believe that these changes to the SRF program would help it more adequately address the needs of small systems and rural communities. In addition, expanded funding of the SRF program would serve to help both small and large communities alike. Both PENNVEST and CIFA endorse the Administration's proposal to expand and extend SRF funding, although this still leaves unfunded a large amount of wastewater and drinking water needs across the country. On behalf of both PENNVEST and CIFA, I encourage the subcommittee members to explore ways of channeling even more funding into the SRF program.

This concludes my testimony. I want to thank the subcommittee for the opportunity to appear here today and I would be glad to address any questions that you might have.

<b>Testimony to the Water Resources and Environment Subcommittee</b>
--

**Keith S. Porter, Director**  
**New York State Water Resources Institute**  
**Cornell University**  
**February 24, 1993**

It is my purpose to summarize the application of the Clean Water Act to small community wastewater treatment systems. For many such systems, the current forum of the Clean Water Act is inadequate. This inadequacy is well illustrated by our ongoing experience in the New York City Watershed Region. I wish to refer to that experience to illustrate my arguments.

The New York City Water Supply is the largest integrated system in the world. It embraces a watershed region of approximately 2,000 square miles and serves almost 10,000 people with very high quality water. It is the need to preserve that high quality which poses contention problems for residents in the watershed served by wastewater treatment facilities. In its understandable determination to protect the integrity of the water supply for which it is responsible, the New York City Department of Environmental Protection is reluctant to permit increases in flows from the wastewater treatment plants within its watershed region. The consequent restriction in community economic growth increasingly jeopardizes the future economic and social vitality of the communities within the watershed.

New York City is compelled to act as a responsible agent in implementing the Safe Drinking Water Act. This Act virtually requires pollution prevention. Management of wastewater treatment however, customarily falls under the Clean Water Act. This Act traditionally has emphasized the remediation of pollution and not its prevention. Such an emphasis is a double misfortune for small community wastewater systems such as those in the New York City watershed. First, New York State has many large urban and industrial areas. In targeting priorities, small community systems do not

figure prominently, and, therefore, receive relatively little consideration. In addition, where a watershed has high quality water, there has been even less incentive under the Clean Water Act to give much priority to wastewater treatment since there is no apparent need for remediation.

As a result, we now find ourselves ill-equipped to determine how best to assist these communities when they are now required to meet very high standards in their discharges. These wastewater systems may have highly variable flows which are only irregularly monitored at best. This variability is greatly augmented by the influx of visitors seeking seasonal recreation as regularly occurs, for example, in the New York City Watershed. The level of training in the operators of the works may be variable. It is perhaps, therefore, not surprising that New York City is attempting to meet their problem by the simple expedient of discouraging increases in hydraulic and pollutant loading from such wastewater treatment facilities in its watershed. The communities are consequently compelled to accept a de facto "no growth" restriction. This would be disastrous economically and it is critical to develop an alternative, which at the same time does not place the water supply of New York City at unacceptable risk.

The collision between the need to protect high quality water, and the necessity for communities to continue to live, work, and play in the watersheds which produce those waters is likely to become a more frequent dilemma throughout the nation. It poses the increasingly experienced conflict between environmental and economic interests. For our society to be sustainable it is imperative this conflict be resolved.

The solution for watershed communities requires the following: the first step is to determine the "carrying capacity" of the watershed relative to the water quality standards it is expected to sustain. This means each wastewater treatment facility should be planned and managed in its watershed context. The determination of permissible levels of discharge should be calculated by explicitly taking into account the cumulative impact of all potentially significant sources of pollution in the watershed. This calculation allows a target level of discharge from each wastewater facility to be determined rationally.

Once the discharge levels are established, communities and industries responsible for the discharge should be allowed to formulate best treatment options by which the required performance standards can be met. By such procedures, it should be possible for treatment facilities to be extended to accommodate growth while remaining in compliance with the target levels established by the calculated carrying capacity of the watershed.

This strategy, especially in rural areas and where communities are small, can only be successfully implemented with new support and technical guidance. Small communities typically lack highly technical capacities, nor do they usually have the means to develop them. It is also highly desirable that communities be encouraged to participate in the planning and management of their wastewater treatment facilities. The Clean Water Act has most successfully fostered public participation in the past. It is highly desirable in the future to foster a sense of ownership and stewardship in small communities where limited means and knowledge otherwise impedes successful adoption of pollution prevention measures. It is, therefore, also desirable that technical assistance be provided to the small businesses and industries upon which the economies of rural and small communities crucially depend. Without such assistance, it is less likely that most appropriate wastewater treatment techniques and technologies will be selected and adopted.

Finally, I note that section 303(d) of the current Clean Water Act already encourages planning wastewater management on a watershed level. This encouragement should be taken further to require integrated planning and maintenance of watersheds. This is especially needed where the water resources produced are of high quality such as in the case of New York City. If this is accomplished with appropriate technical guidance and support, then we have the best chance to have our economic and environmental interests meet in union rather than in conflict.

**TESTIMONY OF  
CABINET SECRETARY JOHN RANSON  
WEST VIRGINIA DEPARTMENT OF  
COMMERCE, LABOR AND ENVIRONMENTAL RESOURCES  
BEFORE THE  
WATER RESOURCES AND ENVIRONMENT SUBCOMMITTEE  
OF THE  
PUBLIC WORKS AND TRANSPORTATION COMMITTEE  
FEBRUARY 24, 1993**

Mr. Chairman and members of the Subcommittee, I appreciate this opportunity to appear before you today to discuss a matter of vital importance to the state of West Virginia -- the funding for municipal waste water treatment facilities in small communities.

West Virginia is a rural state comprised of small communities scattered across a mountainous and beautiful terrain. While these attributes give West Virginia a quality of life unparalleled along the Eastern Seaboard, they also serve to make the funding and construction of publicly-owned water pollution control facilities a challenge.

Over the past 20 years, West Virginia has relied on the U.S. Environmental Protection Agency's Construction Grant Program to fund the construction of waste water treatment facilities. Even though the program was overly burdened by red tape and many projects took too long to complete, more than \$1 billion was spent in West Virginia on water pollution control projects. This \$1 billion represents the construction of 117 sewage treatment facilities and 84 separate collection systems.

West Virginia has made great strides in the past 20 years, and we recognize that we must do more. From an environmental and economic development standpoint, adequate funding will be required if we are to meet our waste water treatment needs over the next 20 years.

A recently completed statewide needs survey shows that West Virginia must have an additional \$2.1 billion to construct 646 municipal waste water treatment facilities. Nearly all of these projects, 97 percent, would benefit communities with populations of 10,000 or less. This information will be included in the EPA's "1992 Needs Survey Report to Congress" due this summer.

The 10,000 population figure also has been used nationally to define small communities. In some instances, a 3,500 population figure has been used to define a small community.

In West Virginia, 86 percent of the proposed facilities, representing about \$1.6 billion in needed funding, would benefit communities with populations of 3,500 or less. If we can accomplish this, then we would have satisfied three-quarters of our unmet waste water treatment plant construction needs.

As you can see, when we talk about small community problems, we are essentially talking about the entire state of West Virginia. The challenge for all of us then is to ensure that funding is available to invest in the infrastructure of our small communities.

The 1987 Water Quality Act eliminated the federal Construction Grants program and replaced it with the low-interest State Revolving Fund (SRF) loan program. Under the program, the federal government would supply grants to states through 1994. These grants, coupled with a 20 percent state match, would then be used to finance water pollution control projects in perpetuity. Each state has implemented an SRF program.

The logic behind the SRF program was, and remains, fundamentally sound. However, the likelihood of a small, financially-strapped community participating in such a loan program was evidently overlooked.

I wish I could tell you today about success stories related to SRF in West Virginia. Unfortunately, I cannot.

We are making loans at a snail's pace, because even with zero percent interest, many small communities in West Virginia simply cannot afford the cost. The move away from a construction grants program, where a community only needed to borrow up 45 percent of a project's cost, to the 100 percent SRF loan program has eliminated most small community projects in West Virginia.

To help you understand how a small community's project can be impacted by a total loan program, I provide the following examples:

- 1) The 660-person community of Handley in Kanawha County constructed a collection system using a 55 percent EPA grant. The average monthly sewer bill is \$22.99. If Handley had to rely on a zero percent interest

SRF loan, the average monthly sewer bill would have been \$31.60, a 37 percent increase.

2) The town of Buffalo in Putnam County built a treatment plant and collection system using a 55 percent EPA grant. The average monthly sewer bill for this town of 1,512 people is \$26.91. If forced to rely on a zero percent interest SRF loan, the community's average monthly bill would have been \$38.53, a 43 percent increase.

3) The Flatwoods-Canoe Run Public Service District covers 2,722 people in Braxton County. A 55 percent EPA grant was used to construct a treatment plant and interceptors. The PSD's average monthly sewer bill is \$28.12. If a zero percent interest SRF loan had been used, the monthly bill would have been \$48.74, a 73 percent increase.

To determine the extent of the funding problem, we examined 20 communities which had received EPA grant awards. During our review, we substituted the grants with zero percent interest SRF loans.

Of the 20, only four communities -- with populations ranging from 3,975 people to 8,945 people -- would have been able to afford their projects. As you can see from these examples, small communities, especially those with populations of 3,500 or less, cannot take advantage of the SRF program as it is currently constituted.

West Virginia's mountainous terrain adds further complications and costs to the development of waste water treatment plants. Our state's geology and geography combine to increase the construction costs to the point where many projects are more expensive than similar projects in non-rural areas of the country.

These natural constraints, coupled with a change on how we are to pay for the construction of waste water treatment projects, causes us to worry about the future of West Virginia's pollution abatement efforts and economic growth.

The need and cost to construct water pollution control facilities in West

Virginia is great. However, the current SRF loan program, as authorized under Title VI of the 1987 Water Quality Act, is TOO RESTRICTIVE for the small communities of our state. Changes to make the program more attractive to small communities is necessary if infrastructure investment and pollution abatement are to occur.

Under the SRF program, projects can be built more efficiently and at reduced cost. Also, a loan fund can grow through investments and loan repayments. Therefore, we believe amending the SRF program under Title VI is the preferred method for future waste water project funding.

We urge Congress to seriously consider the following recommendations when reviewing the reauthorization of the Water Quality Act:

Recommended Amendments to Title VI of the 1987 Water Quality Act to Give States Greater Flexibility in Funding Small Community Projects

1) Additional funds should be authorized under Title VI to provide subsidies (grants) with a low interest SRF loan. States also should have the flexibility to reserve no more than 40 percent of existing fund authorization levels under Title VI for use as subsidies to small communities with financial hardships.

While some states obligate their SRF funds as quickly, some states, like West Virginia, currently have excess funds available simply because of the cost issue. Being allowed to reserve a portion for use as subsidies would enhance the program's attractiveness to small communities and obligate these excess funds.

The definition of financial hardship should be left to each state's discretion. The definition of a "small community" should also be left to each state, but not to exceed a population of 10,000.

2) The repayment of loans should be extended from the current 20 years to 40 years for smaller communities. This would make sewer rates more affordable to customers in smaller communities.

- 3) Exemption from Title II requirements and other federal laws and requirements to eliminate red tape and delays. The 23 additional federal laws and executive orders, such as the archeological, historical and endangered species acts, tend to increase a project's cost and discourage program participation.
- 4) Allow SRF administrative funds to be used for small community outreach and technical assistance.
- 5) Allow land acquisition and easements to be considered as eligible costs. This exclusion appears to have been an oversight when the Act was passed in 1987.
- 8) Allow SRF loans to be used on the same project in communities that have received Title II construction grants.

In West Virginia, 24 communities with construction grants are having trouble getting their projects to the bidding phase because of financial constraints. These grants may be terminated by the EPA if construction doesn't start soon.

We see no logical reason why this additional restriction was inserted into Title VI in 1987. Getting projects built should be our main concern.

Collectively, the above recommendations would enable our SRF program to accommodate our small communities.

While small communities are our Number 1 priority in West Virginia, we believe additional amendments to Title VI of the 1987 Water Quality Act are needed to make the administration of the SRF program more efficient.

These additional recommendations include:

- 1) The 4 percent limitation on administrative costs within the SRF will seriously affect us in future years. This maximum amount should not apply to the SRF loan repayment or other money deposited in the Fund (Section 603 (d) (7)).
- 2) The 20 percent limitation on the use of funds for certain categories of

projects should not apply (Section 201(g)(1)).

3) The 20-year amortization period should be extended to 30 years generally for any size community.

4) And finally, the SRF authorization period should be extended beyond Fiscal Year 1994 so we can meet our total needs assessment statewide.

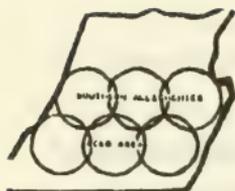

In fact, the National Governor's Association has recommended that \$5 billion per year be authorized in fiscal years 1994 to 1997. We support that recommendation as a minimum.

The Congress created the State Revolving Fund program as a way to finance waste water projects in perpetuity. It was a great idea - for most states.

Now, we need to amend the program to make it workable for small rural states like West Virginia.

We need a program that can help everyone from the largest city to the smallest community. I urge you to give us these suggested changes and then stand back and watch us go to work.

Thank you.

Statement of

Mr. Dick Rice  
Board Member, Southern Alleghenies Resource  
Conservation and Development Council

before

U.S. House of Representatives  
Committee on Public Works and Transportation  
The Subcommittee on Water Resources and Environment  
[sewage treatment needs of rural and small communities]  
Washington, DC

February 23, 1993

Mr. Chairman:

Thank you for the opportunity to provide testimony on behalf of the Southern Alleghenies Resource Conservation and Development Area. The Southern Alleghenies Resource Conservation and Development Area consists of approximately three (3) million acres in Southcentral Pennsylvania (see attachment). Less than 500,000 people reside in our counties of Bedford, Blair, Cambria, Fulton, Huntingdon, and Somerset. This low population density classifies our area as primary rural.

The loss of jobs and industry in the region has had a severe impact on the economic viability of many small communities and all levels of local government. The 1990 census figures show that we have lost both jobs and population since 1980.

Like many rural areas we have higher unemployment and lower per capita income than our urban neighbors. We also have a higher percentage of elderly people on fixed incomes.

Our area has a large number of existing on-lot sewage disposal systems which are malfunctioning and are contributing to the contamination of both surface and groundwater resources. This not only degrades water quality, but also poses a serious health threat as evidenced by many documented cases of spring and well contamination.

The cost of providing needed sewage facilities has often exceeded the financial capabilities of our communities. Sewer projects are more expensive per capita in rural areas than in urban areas due to the lower population densities.

Inadequate levels of funding to rural areas coupled with increased emphasis on loans rather than grants has made it extremely difficult for small rural communities to comply with state and federal sewage regulations. Areas such as ours have an insufficient population base to support loan repayment, and often are unable to even pay for preliminary planning and engineering.

In order to address rural waste water needs we recommend the following proposals for your consideration:

- 1) Work with states to develop a grant/loan program that truly reflects the needs of Rural America and the higher per capita cost of sewage facilities in small communities. More grants, lower interest loans and longer repayment terms would be a good first step. Underwriting the local cost of planning and engineering would also be an important incentive to communities with limited resources.
- 2) Encourage the development of standards and specifications for a package treatment plant that would solve many rural communities' needs without requiring large engineering costs for individual designs and similarly large construction expenses.
- 3) Work with states to encourage projects to demonstrate alternative sewage treatment systems. Few rural communities have municipal systems because of the expense of conventional systems. The state and federal governments have not provided sufficient funding and technical support for the development of alternative systems which may better fit a rural

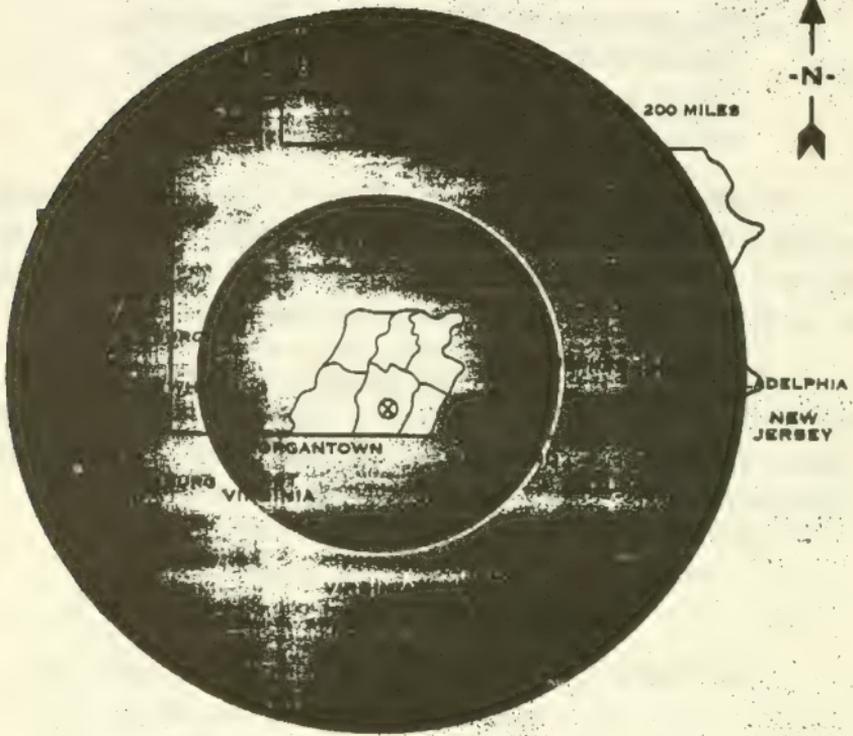

community due to the availability of abundant relatively inexpensive land.

Demonstration projects which provide solutions to unique problems in rural areas should receive the highest priority. An example in our region could involve the development of a treatment system for both sewage and acid mine drainage. The successful implementation of such a system could dramatically improve water quality in many streams currently polluted by sewage and mine drainage.

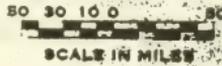

Implementation of strategies like these will go a long way towards meeting the sewage treatment needs of rural and small communities. Not only will we be improving water quality, but we will also be increasing our ability to attract jobs and improve our standard of living.

I thank all the members of this committee for your assistance in helping the Southern Alleghenies Resource Conservation and Development Council, and Resource Conservation and Development Councils throughout the nation, to build a stronger Rural America.

**Testimony of the  
 Association of State and Interstate  
 Water Pollution Control Administrators  
 Before The  
 House Subcommittee on Water Resources and Environment**

February 24, 1993

Mr. Chairman, members of the Committee, I am Roberta Savage, Executive Director of the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA).

We appreciate the opportunity to appear before the Subcommittee on behalf of the Association to share the views of State administrators of Clean Water Act programs related to rural and small communities. Infrastructure needs are difficult for large and medium size communities to address. But, for small towns they can be particularly challenging due to management constraints, unique needs, affordability problems, and stiff competition for the limited Federal, State and Local funding available. There are four critical questions for which we provide the following information for your consideration in addressing small community needs in the Clean Water Act reauthorization.

**WHAT ARE THE WASTEWATER TREATMENT NEEDS OF RURAL AND SMALL COMMUNITIES?**

According to a 1991 ASIWPCA survey and report entitled "*Small Community Financing Needs*", States track over 17,000 small communities with 5000 or less population for wastewater treatment needs. Of these:

- 49% will require construction of facilities and conveyance systems in the next 10 years. Construction is needed in:
  - \* 56% to resolve existing water quality or public health problems.
  - \* 31% in order to avoid future violations of the Clean Water Act.
  - \* 13% to provide secondary treatment to meet the Act's minimum technology requirements.
- Construction costs will exceed \$10 Billion.

**WHAT HAS BEEN THE ROLE OF THE STATE REVOLVING LOAN FUND?**

The State Revolving Loan Fund (SRF), created under the 1987 Water Quality Act, was designed to meet the needs of communities of all sizes. It is successfully achieving that objective:

- 33% of State Revolving Loan Fund (SRF) projects are for small communities.
- 50% of States have small community assistance programs. This includes not only financial assistance, but technical and administrative assistance as well.

- **The streamlined nature of the loan program has benefited small communities.** Projects are being built at less cost, and 50% faster than under the Title II Construction Grant program.
- **However, in 50% of States, more than half of those needing construction cannot afford the debt service on an SRF loan if it were to cover the entire cost of the project.**

Based on these results, ASIWPCA has concluded that:

- 1) The SRF is a desirable option for most small communities, but total reliance on the SRF, in its present form, will not always be an affordable option in all cases.
- 2) Because of the high variability of affordability problems, local needs, and appropriate technology, State flexibility is essential. A nationally uniform approach to small community assistance would both misdirect scarce resources and exclude some hardship communities from eligibility.
- 3) Generally, small communities can afford SRF financing for at least a portion of their projects.
- 4) Small community needs should be addressed under the SRF umbrella. The SRF eliminates any incentive to delay compliance and greatly enhances local "ownership" over the construction and operation of treatment systems. Many more projects can be constructed under the SRF as opposed to a grant program. It yields more environmental results at less cost to communities than under Title II.

#### **WHAT ARE ASIWPCA'S RECOMMENDATIONS FOR MEETING SMALL COMMUNITY NEEDS?**

The ASIWPCA survey report makes a compelling case on the need for additional financial resources for small community wastewater treatment -- above and beyond continuing the existing funding level, of at least \$2 Billion annually for the SRF to meet pre - 1987 Water Quality Act requirements. In the Clean Water Act reauthorization:

- 1) **Small community financing should be addressed in the Clean Water Act State Revolving Loan Fund (SRF)** to assure as much cohesiveness and consistency as possible. States need one umbrella program as opposed to a plethora of program bureaucracies with different requirements, priorities, and processes. Proliferation of independent financial programs is detrimental due to competition, confusion and management inefficiencies. I.E., small communities need "one stop shopping".
- 2) **Supplementary authorization should be provided** for small communities in the SRF to:
  - \* Encourage additional technical assistance by the States, and
  - \* Allow States to blend principal subsidies with SRF loans to achieve a target State means test, e.g. percent of State (not national) median household income. The objective should be for States to assist affordable, effective treatment, rather than the Federal government encouraging competition from grant funds.

The Association emphatically does not support a return to the Title II grant program.

3) **Future Federal legislation should not:**

- \* **Detract from the need to fully fund and implement the Clean Water Act commitment to the SRF.** Since there is currently no new funding for new Congressional programs, the Association is concerned that a program for small communities not be funded at the expense of the SRF.
- \* **Delay facility compliance.** Any limited program with principal subsidies should focus solely on hardship small communities to assure that other communities without financial hardship do not misinterpret legislative intent and await the return of the Title II grant program.

4) **Future Federal legislation should:**

- \* **Give States broad flexibility** to tailor funding mechanisms to meet the needs of their small communities. No two States are alike, nor are their communities.
- \* **Capitalize a State program.** The need for Federal involvement is minimal. Federal agencies are too remote from the beneficiaries -- who often have immediate and intensive personalized needs -- to be of much assistance, except as a clearinghouse, e.g. for innovative approaches.
- \* **Further minimize the requirements placed on small communities** due to their impact on project costs and their limited project management capabilities by:
  - .. **Giving States the discretion to apply Title II goals as appropriate to individual projects.** In the absence of obtaining this type of flexibility, the following modifications to Section 602(b)(6) are necessary:
    1. Delete Section 201(g)(1), 20% Limitation
    2. Delete Section 201(g)(5), Innovative/Alternative Analysis
    3. Delete Section 201 (6)(g), Recreation/Open Space Requirements
    4. Delete the word "proportional" in Section 204(b)(1), User Charge Requirements
    5. Delete the mandatory nature of the requirement to perform value engineering in Section 218, Cost Effectiveness
    6. Delete Section 513, Labor Standards Provisions
  - .. **Eliminating the 20% limitation on SRF funding for collector sewers, etc.**
  - .. **Providing States the flexibility to allow up to a 40 year loan repayment period.**
  - .. **Allowing funding of land, easements, and rights of way.**
- \* **Allow a greater percentage of funds to be used for administration and technical/administrative assistance.** I.E., 4% of capitalization grants, as States have learned under the SRF, is not adequate to manage the SRF. Small community needs will be more demanding than for the average size city.

- \* Broadly define "small community" to include such entities as special benefit assessment districts and allow States flexibility to include those up to 10,000 population.
- \* Simplify audit requirements, using the Single Audit Act of 1984 to eliminate duplication and achieve greater audit coverage.

5) For expanded eligibility for water supply facilities:

The Association could support appropriation of supplemental funds for water supply projects and, for the short term use of the Title VI SRF as the vehicle for distribution of these funds. Furthermore, an "SRF type mechanism" should be considered as the best long term vehicle for funds distribution. However, such funding must be in addition to existing Clean Water Act appropriations, and not demean the integrity of the Clean Water Act SRF. Specifically:

- \* Additional funding must be authorized and appropriated above the \$5 Billion level recommended for Clean Water Act needs under the Title VI SRF program.
- \* States must have flexibility to establish separate SRFs, develop separate funding priorities or include water supply project funding under existing Title VI SRFs.
- \* There must be separately identifiable Federal funding sources for both the Clean Water Act and Safe Drinking Water Act assistance programs.
- \* A Safe Drinking Water needs development process must be established to provide Congress and others with information on funding levels to support the program with expanded eligibilities.

WHAT WAS THE STATES' EXPERIENCE UNDER THE CONSTRUCTION GRANTS PROGRAM FOR INNOVATIVE AND ALTERNATIVE TECHNOLOGIES? WHAT SHOULD BE THEIR ROLE IN THE 1990'S?

The Association did not support the mandatory Title II setaside for innovative and alternative (I&A) technology and is dissatisfied with the program's performance. The Act required 4% of Construction Grant funds be setaside to increase the base level of Federal cost share by 10%, in order to promote I&A technologies. States encountered a number of problems.

- The program was often out of proportion to the need. The 4% setaside was in reality a 34% setaside. I.E. 30% of a State's allotment was needed to provide the base Federal share to which the additional 10% of match was applied using the 4% setaside.
- Some marginal projects were selected, in order to expend (and not lose) the allotment.
- The failure rate of I&A projects was higher than desirable.
- What began as a legitimate concern, quickly turned into a complex bureaucratic exercise with reams of manuals, guidance and policies. This complicated an already over burdened Federal Construction Grant Program.
- Decisions often hinged on vague definitions which may or may not be appropriate. Projects were selected that did not fit the intent of the law, i.e. were less than innovative.

- Communities, lured by the extra funds, were convinced to undertake projects which they could neither manage nor afford to operate or maintain.**

While there also were many successes, the objective got lost in the bureaucratic translation. In the 1970's, ASIWPCA recommended that Congress eliminate the mandatory nature of the setaside. We suggested that the concept take a more productive perspective, by focusing comprehensively on the operative meaning of wastewater treatment technology -- better correlating between specific technologies and long term realistic community capabilities using:

- 1) **A discretionary goal oriented approach** to encourage I&A.
- 2) **Incentives** for State programs, grantees and consulting engineers to perform high quality project planning.
- 3) **Improved research and development/technology transfer** to share information among the States and enhance local program management techniques.

These concepts have as much value today. Small communities generally need relatively simple, less demanding technologies. The SRF, by virtue of being a loan program over which communities maintain a strong degree of ownership, is encouraging appropriate I&A approaches. These efforts should be assessed. If further action is needed, the States urge the Committee to focus on the use of incentives in the SRF program, such as the State ability to provide interest subsidies (to a limited extent that does not unduly undermine fund corpus) and the USEPA's need to re-energize research and development, and technology transfer.

#### WHAT SHOULD BE THE ROLE OF CONSTRUCTED WETLANDS?

States are recognizing the role of constructed wetlands as a form of wastewater treatment. But, it is important to recognize their limitations:

- Constructed wetlands are, in many ways, a new concept. Much more needs to be learned.
- It is appropriate in some circumstances and not in others. E.g. if suitable land (in terms of size and characteristics) is available., e.g. a wetland previously existed on the site, the outlook for success is better.
- The costs can still be high, e.g. due to the need for collectors. Local community maintenance requirements can be high, e.g. in comparison with lagoons.

States should be encouraged to consider constructed wetland as a treatment alternative where appropriate. But, caution should be exercised, because non-conventional technologies, especially wetlands, are not a panacea. This is one area where USEPA could provide valuable assistance by funding research and development, and by transferring the results of existing projects.

CONCLUSIONS

A refined approach to funding wastewater treatment infrastructure is worthy of consideration for small communities most in need of financial assistance. However, such action should not undermine the Congressional commitment to the Clean Water Act State Revolving Loan Fund or fragment the overall financing program. States need to be clearly allowed to establish priorities based on their specific water quality and public health concerns. The key to success in meeting small community needs lies with flexibility -- giving individual States control over program design and operations. All Federal efforts to meet the needs of small communities should be closely allied with the Clean Water Act State Revolving Loan Fund to produce one cohesive funding strategy. Congress needs to allow States to use the SRF structure to administer a small community program, rather than establishing a separate entity.

Again, Mr. Chairman, the Association of State and Interstate Water Pollution Control Administrators appreciates this opportunity to discuss the State perspective. We would be happy to answer any questions which you or other members of the Committee may have.

Testimony of the State of Ohio  
Environmental Protection Agency  
Before the  
House Water Resources and Environment Subcommittee  
February 24, 1993

Mr. Chairman, members of the Subcommittee, I am Greg Smith, Chief of the Division of Environmental and Financial Assistance for the Ohio Environmental Protection Agency. I appreciate the opportunity to appear before you today on behalf of the State of Ohio to provide comments about the needs of small towns and rural areas in meeting Clean Water Act requirements. We commend your decision to focus attention on this important aspect of municipal water pollution control.

It is an important aspect because although the needs of small communities are widely recognized, they pose some of the greatest challenges which have been presented by our county's water quality goals. Most importantly, these needs have not been adequately met at the State or federal levels.

As you receive testimony on this issue, witnesses will present various statistics throughout your hearings to demonstrate that small communities are in need of water pollution control assistance. I respectfully submit that the challenge before us now is to go beyond the data on small communities, and to jointly devise substantive strategies which are both comprehensive and effective in meeting the interests of the small and rural communities which we serve.

The statistical information I will present today regarding the need for small community wastewater treatment assistance is a summary of the results of a municipal needs survey conducted by our agency during the Summer of 1992. The survey data are a compilation of the needs identified for small community wastewater treatment improvement projects contained in various documents either prepared by small communities or by others. These estimates show a combined construction cost over \$1.1 billion in Ohio for communities which have under 10,000 population. I must also point out that since these estimates are derived only from reported construction needs, in all likelihood they underestimate the magnitude of small community construction needs in our State.

This survey information also gives us some indication about the nature of small community wastewater treatment needs. As you can see, most of the facilities improvements are for project types which provide basic levels of wastewater collection and treatment. A relatively small percentage of the costs in each category is devoted to attaining advanced levels of treatment. This observation coincides with our experience that much of the expense for small community wastewater facilities in our State is dedicated to preventing sewage from escaping to the environment, and to providing the most basic levels of treatment. Thus the most immediate small community needs are not to provide minor increments in pollution removal, but are more to provide protection of public health, and a basic level of quality of life for our small community and rural residents.

Why aren't more of these projects coming forward for financial assistance? Unfortunately, for small towns with limited technical and administrative expertise, undertaking almost any wastewater project is an intimidating experience. Also, they know it will be expensive, and in many cases not only is it politically unpopular, but it poses a genuine financial hardship to many segments of the community. These very real limitations inhibit local officials from taking steps to address their treatment needs.

The options available to help them overcome these obstacles are also limited. There is currently no single source of help where small, economically distressed communities can find the broad range of assistance that they need. In Ohio, some agencies provide partial funding through grants, but usually the community itself must try to paste together a satisfactory package of grants and loans to make an affordable project, often from three or more different sources. These different sources have different requirements, different objectives, and different application periods. The community is left to assemble and then preserve this fragile collage of financing in order to make the project financially feasible.

Most sources of financial assistance do little more than provide funds; communities receive little guidance as how to develop their project so that it effectively meets their own needs. Often small communities need help in identifying appropriate project alternatives which have the right combination of operability and cost-effectiveness for their special circumstances. Also, we find that many community officials appreciate suggestions regarding how to establish user fee systems, sewer use ordinances, and operation and maintenance programs for their facilities. Beyond financing for affordability, the community's ability to successfully implement these administrative elements will determine whether their system will successfully perform after it is built. Individual guidance and assistance for these items is also difficult or expensive to obtain.

In Ohio we have attempted to fill these small community needs. We have informal coordination among financing agencies to focus financial resources on a limited number of projects. Our SRF also emphasizes technical and administrative as well as financial assistance. (Within the 18th Congressional district the SRF has made loans to eight communities, and has given various levels of technical assistance to each.)

But even with these efforts, we believe that the SRFs will continue to be prevented from becoming the full-service assistance vehicle that small and rural communities need unless Title VI is comprehensively redesigned. We are therefore proposing that the Congress reconstruct the SRFs to better accomplish the goals of the Clean Water Act, and to meet the needs of our client communities.

We are calling for a second-generation SRF for two reasons: First, the needs of small, economically distressed communities are not adequately served by the present structure. With the support of Congress, the SRFs can do more - and want to do more - to make wastewater improvements for small communities of high economic need affordable. If we are to enact a truly community-centered approach to financial assistance, we must have a positive and effective mechanism to do so.

Secondly, our Governor and our Director have set a standard for the Ohio EPA to be assistive rather than regulatory as a first resort in achieving our mission of protecting the environment. No where is that philosophy better embodied than in our SRF program. We have abandoned the construction grants program command-and-control methods and now seek to accomplish water quality objectives through comprehensive assistance rather than compliance enforcement. I believe that the SRFs are the best vehicle with which to pursue that philosophy, and that it is a necessary philosophy particularly for our relationship with small, economically distressed communities. *If the Congress can agree with that approach, then we call upon you to empower us as States with adequate mechanisms to do so. The SRFs must be rebuilt to comprehensively accommodate small communities*

In view of the above, we respectfully set forward the following general recommendations.

1. Allow SRFs to provide principal subsidies, blended with SRF loans to achieve State-determined levels of project affordability, subject to a means test.
2. Establish specific authority and funding in Title VI for States to institute outreach programs for technical, administrative, and financial assistance to small and rural communities.

3. In coordination with the States, redesign all project-level requirements and limitations which apply to small community SRF projects to first be responsive to small community needs, and then to meet only the most compelling federal interests.

In the interest of time, I will defer elaborating on these recommendations, but we will be pleased to provide the subcommittee with a more specific list of recommended changes for the record.

Thank you once again for the opportunity to appear before you today. The Ohio EPA stands ready to help the committee in any way we can as it continues its deliberations on this issue.

GHS/gjw

TESTIMONY BEFORE THE SUBCOMMITTEE ON  
WATER RESOURCES AND ENVIRONMENT

Honorable Chairman, members of Congress, ladies and gentlemen, I am William C. Stafford, Jr. and I am the Chairman of the Lee County, North Carolina, Board of County Commissioners. Along with me is Robert F. Joyce, Lee County Economic Development Coordinator who will assist with answering any questions you may have. Today, I am here to speak to you regarding the burden Lee County and other such rural areas have bearing the cost of Clean Water Act federal mandates concerning permitted sewage treatment facilities, and wish to share with you comments which hopefully will lead to an era of sustainability.

The provision of safe wastewater treatment is crucial to the social and environmental health of rural communities. The federal government recognized the need to restore integrity to our nation's waters by adopting the Clean Water Act. The Clean Water Act attempts to address point source pollution by permitting and regulating sewage treatment plants. Advocates of the Clean Water Act can claim many victories: 10,000 sewage treatment plants have been constructed nationwide since 1981 solving the sanitary sewer needs of many. Nevertheless, the Clean Water Act does not address problems caused by non-point source pollution from failing septic tanks and stormwater runoff. Unfortunately, the problem of non-point source pollution often outweighs the obvious gains of

large sewage treatment plants.

Nationally, a large amount of federal money was devoted to the construction of many wastewater treatment facilities in the 1960s, 70s, and early 80s. In 1987, a program of federal assistance to the states for construction of these plants was reauthorized in an amendment to the Clean Water Act providing a total of \$9.6 billion in grants through 1990. Federal loans will be provided to states for the treatment facility construction only through 1994, at which time all federal loans for this purpose will cease. The lack of federal funding to supplement the increasing costs of compliance with federal mandates, particularly EPA regulations, will unfairly burden rural areas as well as smaller municipalities.

Although much has been accomplished with the federal money spent to construct sewage treatment facilities, little of this funding ever reached past cities and towns to rural areas such as the unincorporated portions of Lee County. The bulk of federal funding during these past decades focused almost entirely on the construction of large municipal wastewater treatment facilities for metropolitan areas. Little has been done to help rural America with failing septic systems and with no affordable access to municipal sewer. When the federal government relinquished its responsibility for infrastructure financing to each state in the early 1980s, more and more of the financial burden fell on local governments to enforce the regulations mandated by the federal

government. The problem becomes clear. Large metropolitan areas have a greater tax base upon which to draw the funds necessary to install, maintain, and expand federally mandated wastewater treatment facilities. There simply is not enough money in smaller rural communities, such as Lee County, to provide adequate sewage facilities to all their citizens who look to their local government for help.

This quiet crisis is looming and threatens the health, environment, and economy of Lee County. Thousands of our citizens do not have affordable access to safe sewage disposal. Lee County is situated geographically in the center of North Carolina with a total land area of 255 square miles and a total population of over 41,000. Approximately 92% of the area and roughly one-half of the population of Lee County is not served by municipal sanitary sewer. According to Lee County's environmental health specialists, approximately 25% of the existing septic tanks in Lee County are now malfunctioning. Lee County's geological make-up is such that over two-thirds of the county is composed largely of clay and siltstone rock. Clay is almost impermeable and is an extremely poor soil for the location of septic tanks which does not allow wastewater to dissipate.

It is critical that the federal government not take actions that will make it more difficult for local governments to raise the revenues necessary to meet their growing needs. The quality of a

community's infrastructure is a critical index of its economic vitality. Reliable transportation, clean water, and safe disposal of wastes are basic elements of civilized society and a productive economy. The absence or failure of these elements introduces an intolerable degree of risk and hardship to everyday life, and becomes a major obstacle to growth and competitiveness. Increasingly stringent regulations can blunt a local government's efforts for planned growth. Limited amounts of land served by sanitary sewer is a constant foe to local economic development efforts. Our county is the victim of a vicious cycle. Much of the land is unsuitable for on-site sewage disposal systems and little or no municipal sewer is available in those areas. Industrial, commercial, and residential development cannot occur in areas without a means of approved waste disposal. Without greater development, neither the tax base nor the user rates paid by current users of the municipal sewer system is sufficient to generate the capital necessary to facilitate a constant, steady expansion of the existing sewer system. Lee County certainly is not alone in its predicament. The federal government must act as a full and responsible partner on a long-term basis in the national effort to increase and sustain public capital investment.

Current federal regulations resulting from the Clean Water Act are not only problematic to local governments due to a lack of funding, the actual regulations themselves are difficult to enforce due to their constant changes. The Public Works Director for the

City of Sanford, the largest municipality in Lee County with a population of slightly over 20,000 and the sole provider of municipal wastewater treatment in Lee County, refers to Sanford's efforts to stay ahead of the ever-changing regulations as similar to "shooting at a moving target". The City of Sanford's Big Buffalo Sewage Treatment Plant was built in 1975 with a capacity of five million gallons per day at a cost of approximately \$5 million dollars. This facility was designed to serve Sanford's citizens for twenty years. However, federal regulations continued to tighten over the following years until, fifteen years later, when only one half of Sanford's sewage treatment facility was being utilized, the City was placed under a "special order of consent" by the State of North Carolina to comply with the latest regulations regarding the lower amount of dissolved Oxygen. Essentially, the City of Sanford was told that although their relatively new sewage treatment plant was only utilizing 50% of its capacity, they could not add even one more user without making costly updates. Fortunately, the citizens of Sanford recognized the need for the required improvements and passed a bond referendum for in excess of \$13 million dollars. However, this bond financing increases the debt load for our community and makes citizens reluctant to support other debt financed projects such as schools. Such burdensome costs incurred by the City in their effort to comply with federal mandates clearly limits the future expansion of Sanford's municipal sewer system and therefore prevents more of Lee County's citizens from obtaining clean, safe wastewater

treatment.

While the benefit of securing an enduring safe water supply is not disputed, the costs of mandated regulations are constantly growing. These rules drive state policies which must, in turn, be enforced by local governments. Although federal funds were readily available and utilized to construct Sanford's original wastewater treatment plant, little federal assistance other than a \$750,000 Economic Development Administration Grant was available when the costly updates in the system were completed. The mandated improvements were concluded in 1992 with a total cost of \$10.8 million dollars. The capacity of the system was increased to 6.8 million gallons per day even though the additional capacity was not immediately necessary. Even today, only approximately 4 million gallons of wastewater per day is being treated by Sanford's treatment plant. Using an average cost of \$30 per linear foot as the cost of new sanitary sewer line, the same \$10.8 million dollars could have provided an additional 68 miles of sewer line and have enabled thousands of additional Lee County citizens affordable access to sanitary sewer.

The payment of the costs of federally mandated wastewater treatment improvements is not always so obviously borne by the citizens of a municipality. Most municipalities, including the City of Sanford in Lee County, have resorted to supplementing "user rates". User rates allow for only those citizens who actually use

the municipal sewer system to pay for its maintenance; however, user rates usually do not fully refund a municipality the administrative and economic opportunity costs associated with capital projects of this magnitude, nor do they provide enough money to allow for the steady expansion of the system. Steady increases in municipal user rates are common in the municipality's attempt to fund the rising cost of maintenance. The City of Sanford has been forced to increase their sewer user fees 124% over five years. Although financially necessary, such increases greatly impact all the users of the system, in particularly those users who are already economically disadvantaged.

The "pay only for your usage" policy is also not conducive to the needs of the rural sewer user. Typically, rural residential users cannot afford to pay the full cost associated with their utilization of such systems. This means that in order for a municipality to provide sanitary sewer to rural residential users, the municipality must look to industrial and commercial users, as well as to ad valorem taxes, to subsidize the costs. Essentially, without federal and state assistance, rural residential users of municipal sewer must have the cost of their usage subsidized locally; otherwise, they cannot afford the full costs associated with usage of the municipal sanitary sewer system. Unfortunately, we live in a world where local municipalities as well as industrial and commercial development can no longer afford the cost of subsidizing rural citizens. In our county, waste producing

industries have been forced to instigate costly pretreatment of their waste before it is transferred to the municipal sewer system. Many of Lee County's industries are not as fortunate as Praxis Biologics, a local pharmaceutical industry, which is an extremely low waste producer. Overall, the cost of their wastewater management is becoming increasingly high. Guest, Keen, Nettlefold (GKN), a local automotive component manufacturer, has experienced similar financial problems due to rapidly changing federal regulations. Dennis Donovan, GKN's plant manager, cites the pressing need for long term EPA regulations. GKN recently purchased an expensive piece of industrial equipment which was rendered obsolete long before the equipment was depreciated due to rapidly changing EPA regulations.

The burden to provide safe sewage disposal systems as mandated by the Clean Water Act weighs heavily on local governments. Federal programs related to rural residential wastewater treatment facilities must be adequately funded with federal dollars using the national economies of scale, which will allow smaller, rural areas the same opportunities to obtain safe wastewater treatment mandated by this body as is offered to larger metropolitan areas. In addition to these direct economic costs, the related socioeconomic price of lacking adequate wastewater treatment facilities is high. Increasing urban sprawl, facility and service problems related to education, sanitation, recreation, law enforcement, and health services are all products of the growing problem in Lee County, as

well as in other similarly rural areas throughout the country. There would seem to be serious equal protection concerns arising from the schism rural citizens face regarding affordability and sustainability of Clean Water Act standards. Additionally, the natural environment suffers because land preservation and conservation efforts are compromised in areas of better soils due to the homesteading effect of subdividing large tracts two to three acres at a time. Ultimately, a rural unit of government becomes unable to plan for proper service delivery resulting from these effects. It is imperative that the federal government assist rural units of government, such as Lee County, today to mitigate tomorrow's ever-growing consequences. In the 1930s, rural electrification assisted non-urban areas to grow. Today, wastewater treatment assistance is needed to help stop the cycle of poverty in rural areas, and to help rural citizens realize the benefits of the "American Dream".

The Clean Water Act has accomplished much good throughout the nation's urban areas; however, the focus of the Clean Water Act must be broadened to recognize the limited fiscal capacity, as well as the sewage treatment needs, of rural areas as well as of urban areas. Sufficient federal monies should back both urban and rural oriented programs with long-term solutions for the problems of both point and non-point source pollution, and should strive to fulfill the original intent of the Act -- to ensure the safety and cleanliness of our nation's waters -- by providing federal funds

for the implementation of federally mandated programs aimed at providing safe sewage treatment alternatives to all Americans. Such action will allow us all to reach a level of sustainability with regard to mandates as well as economic competitiveness.

I thank you for your invitation, your time, and your willingness to hear from rural America. If you have any questions, please feel free to ask.

Dear Congressman Applegate:

I am enclosing a summary of issues I requested from the state agency in South Carolina which administers the State Revolving Fund loan program. This summary was requested while your subcommittee conducted its Clean Water Act reauthorization hearings in February.

Thank you for the opportunity to provide this input from an agency directly involved in this important program. If I may provide additional information, please do not hesitate to contact me.

With kindest regards, I am

Sincerely,

  
James E. Clyburn

Re: Sewage Treatment Needs of Rural and Small Communities

Dear Danny,

Enclosed is a summary of my thoughts on addressing sewage treatment needs of small, rural areas.

Thank you for allowing me to input some thoughts on this important matter.

Sincerely,

*Mike*

G. Michael Caughman

cc: Mike Gulledge

GMC/edm

## SEWAGE TREATMENT NEEDS OF RURAL AND SMALL COMMUNITIES

Small communities, which serve the needs of rural areas in our country, face special problems in dealing with existing requirements as well as new mandates in the environmental arena. The discussion below will deal with those problems germane to the provision of wastewater services to the public.

- Small communities lack expertise to deal with new requirements and technologies. Government at Federal level should focus on providing technical assistance monies to the State governments to assist in this area.
- Small communities often are saddled with technologies too complex and costly to operate and maintain. The Federal government should direct that State agencies with environmental oversight responsibilities utilize special review criteria prior to construction permitting that emphasizes inexpensive, simple, low-cost technologies for small, rural community water and wastewater projects.
- Small communities are faced with an Economies of Scale problem. To address this, the Federal government should reemphasize the area wide planning intent of the Clean Water Act to reflect regionalization where possible.
- The Federal government, with numerous sources of grant and loan money, should simplify and standardize eligibility application formats and environmental assessment formats associated with assistance applications. Water conservation should be emphasized with a discount on interest rates.
- The Federal government should assess not only the wastewater impacts on small communities, but also the overall impact of all environmental requirements. Based on some developed criteria which indicates "financial incapability", there should be an "interim status" afforded under a compliance plan arrangement, similar to proposed H.R. 3246 and S. 1226. The effect of a compliance plan (which must be approved by State regulatory agencies) would be to prioritize consistent with both environmental and financial constraints at the local level.
- Small communities often are not assessing adequate user charges to cover operation, maintenance, and replacement. The Federal government should require that adequate user charges be recovered for all environmental programs, and that these be subject to yearly audits by State governments. Funds should not be co-mingled with others, or otherwise used outside of the program from which funds originated.
- The discharge permits require more and more. States should continue to have latitude for site specific water quality environmental criteria to be developed, and Federal government should provide moneys for the State governments to do so.
- Civil penalty assessment matrices should iterate more leniency toward small communities who are unable to pay. Federal emphasis should also be to insist on utilization of civil penalty moneys in environmental/environmental remediation programs only.
- Economic variances should be emphasized at Federal level and exercised at state level when appropriate.

- Federal emphasis should be toward a policy of extended compliance periods for small communities who illustrate financial incapability.

- The Federal government should research and promote better construction methods to preclude Infiltration/Inflow (wastewater) and outflow (potable water)..

- The Federal government should provide special moneys earmarked only for small communities to be utilized in low interest grants and a loan program such as the existing State Revolving Fund program. These moneys should also allow grants in some financially disadvantaged communities, but only in combination with low interest loans and an ability to pay index. In the case of small communities, the Title II requirements currently associated with the EPA's SRF program (Title VI) should be waived, therefore meeting the same requirements as non-SRF projects. This should accrue to short-term supplemental, job creation money as well as the Clean Water Act reauthorization.

- The State should have the latitude in the SRF to extend amortization periods beyond 20 years at their discretion based on useful life expectation of segmented project. At the same time, the Federal government should rethink its 40 year loan policy that Farmers Home Administration currently has in that this exceeds the useful life of some portion of a project. Not addressing this will compound debt on future generations as replacement becomes necessary prior to this 40 year period.

## Wastewater Treatment Needs in Unsewered Areas

Twenty-seven percent of the housing units in Minnesota are not connected to a public sewer; most of these homes are located in small cities, rural subdivisions and lakeshore areas across the state. County officials estimate that 70 percent of the on-site treatment systems (septic systems) serving homes and other establishments do not conform to minimum treatment and/or design standards. These nonconforming systems discharge raw or inadequately treated sewage to surface and ground waters, which can result in serious health and environmental consequences.

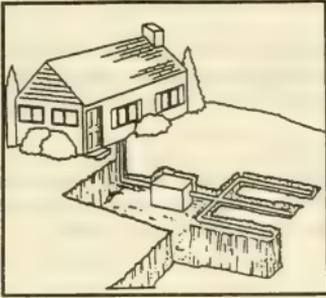

In 1991, the Legislative Water Commission directed the Minnesota Pollution Control Agency and the Department of Trade and Economic Development to study issues related to the future of wastewater treatment financing in Minnesota. The agencies made several recommendations in February 1992, one of which was to form a committee that would study and develop approaches for addressing the growing health, environmental and financial needs of unsewered areas. In March 1992, the Unsewered Area Advisory Committee (UAAC) was formed. The UAAC includes representatives from watershed districts, counties, cities, townships, regional development commissions, private contractors and state agencies.

The UAAC has issued a report entitled Wastewater Treatment Needs in Unsewered Areas - Report to the Legislative Water Commission. The report will be presented to the Legislative Water Commission in January 1993. The report describes the scope of the problem, lists related issues, discusses existing programs, and makes recommendations on how to resolve the wastewater treatment problems in unsewered areas.

Recommendations include:

- Implement Individual Sewage Treatment Standards (Mn. Rules Chapter 7080) on a statewide basis to ensure consistent standards regarding on-site systems.
- Require a mandatory certification program for professionals involved in the construction, inspection and maintenance or design of on-site systems.
- Institute a statewide enforcement program to maintain standards.
- Provide maintenance guidance to municipalities for the oversight of on-site systems within their jurisdictions.
- Continue support for the current Individual On-Site Wastewater Treatment Systems Grant Program and support revisions based on environmental criteria.
- Educate the public and others on the benefits and importance of conforming treatment systems.
- Provide funding for research in technology improvements.
- Assist municipalities in wastewater planning efforts.

If you have questions or would like to receive a copy of the report, call Vicky Cook of the MPCA at (612)296-7248 in the metro area or toll-free at 1-800-657-3864.

# RECOMMENDATION SUMMARY

**WASTEWATER TREATMENT  
NEEDS IN UNSEWERED AREAS**

---

**WASTEWATER TREATMENT NEEDS IN UNSEWERED AREAS**

January, 1993

**REPORT RECOMMENDATION SUMMARY**

The Unsewered Area Advisory established and prioritized the following recommendations. The first two recommendations need to be implemented immediately in order to provide structure and statewide consistency for addressing on-site sewage treatment problems.

**RECOMMENDATION #1 - STATEWIDE STANDARDS**

Legislation should be enacted that requires Minnesota Rules Chapter 7080 (Individual Sewage Treatment Standards) be implemented statewide to provide consistent standards for the design, location, installation and maintenance of individual on-site sewage treatment systems.

**Target Implementation Date:** January 1, 1995

**Estimated Costs:**

**Local Governments:** \$300 - \$600 (Ordinance adoption), \$unknown (administration)

**Possible Funding Sources:** Self-supported by fees.

**RECOMMENDATION #2 - MANDATORY CERTIFICATION PROGRAM**

Legislation should be enacted requiring a mandatory certification program for on-site professionals. This will prevent underbidding by unqualified contractors, and greatly reduce the number of inadequate on-site systems designed, installed, inspected and maintained by unqualified individuals.

**Target Implementation Date:** July 1, 1994

**Estimated Costs:**

**Local Governments and Private Contractors:** \$100 per yr per person (Staff certification/training, expenses)

**State Agency (MPCA):** \$180,000 per year (3 agency staff, salaries, supplies, expenses)

**Possible Funding Sources:** Self-supported by fees.

**RECOMMENDATION #3 - STATEWIDE ENFORCEMENT**

Legislation should also be enacted for a statewide enforcement program to provide a mechanism for bringing all on-site systems in the state up to code by the year 2005.

**Target Implementation Date:** January 1, 1995

**Estimated Costs:**

**Local Governments (Counties):** \$10 - \$15 per system (Survey of nonconforming systems), \$50 - \$100 per system (Inspection), \$60 - \$100 per system (Enforcement)

**Individuals:** \$2,000-\$10,000 (Nonconforming system replacement)

**Possible Funding Sources:**

System permit, inspection fees, enforcement penalties, DNR Shoreland Management Grants, MPCA/PFA On-site Grants Program, State Revolving Fund, home improvement & other private loans

**RECOMMENDATION #4 - MAINTENANCE PROGRAM**

Maintenance guidance should be provided to municipalities\* for the oversight of the on-site treatment systems within their jurisdictions. Municipalities should track system maintenance by using a reporting system, or contract to have the systems maintained and bill the residents for the service.

**Target Implementation Date:** January 1, 1996

**Estimated Costs:**

**State Agencies** (University of MN Extension, MPCA & DNR): \$10,000 (Guidance development, publication & distribution)

**Local Governments:** \$1,000 (Start-up costs, Education), \$100 - \$500 per year (Tracking, administration)

**Individuals:** \$25 - \$50 per year (Maintenance every 3 years)

**Possible Funding Sources:** Fees from pumpers, U.S Environmental Protection Agency [EPA], Legislative Commission on Minnesota Resources [LCMR] (educational programs)

**RECOMMENDATION #5 - CONTINUATION OF CURRENT FUNDING PROGRAM**

The Legislature should continue to support the current Individual On-Site Wastewater Treatment Systems Grant Program until a revised program, using environmental priorities, can replace it. Funding is necessary to provide incentives and direction for municipalities without sufficient financial resources in order to bring all systems into conformance.

**Target Implementation Date:** July 1, 1993

**Estimated Costs:**

**State Agencies** (MPCA, PFA): \$1,000,000 per year (Grants to municipalities @ \$100,000 per project) , \$80,000 per year (1 1/4 staff, salaries, supplies & expenses)

**Local Governments:** \$1,000 - \$5,000 per project (Administration)

**Individuals:** \$1,000 - \$5,000 per system (50 percent not covered by the grant)

**Possible Funding Sources:** State Legislature, municipal bonds, home improvement, other loans.

**RECOMMENDATION #6 - EDUCATION**

For many of the recommended solutions to be effective, education on the benefits and importance of conforming systems is necessary. People must be made aware that they are ultimately responsible for the wastes they generate.

**Target Implementation Date:** January 1, 1995

**Estimated Costs:**

**State Agencies** (University of MN Extension, MPCA): \$10,000 (Education program development), \$20,000 (Video, copying, distribution), \$20,000 (Public outreach)

**Possible Funding Sources:** EPA, LCMR (educational programs), video rental fees

**RECOMENDATION #7 - RESEARCH**

Legislation should include funding for research to support investigation of innovative on-site systems, foster technological improvements and maximize the effectiveness of systems in Minnesota's soil and climate.

**Target Implementation Date:** April 1, 1995

**Estimated Costs:**

**University of Minnesota Extension:** \$250,000 per year (Research development, staff, start-up and projects)

**Possible Funding Sources:** LCMR, EPA and private industry

#### **RECOMMENDATION #8 - PLANNING ASSISTANCE**

Planning assistance to local governments is crucial if they are to develop adequate plans to address current and future wastewater treatment needs. Determining whether on-site systems are the best environmental and most cost-effective solution for wastewater treatment is a difficult problem for many municipalities. Planning for new development is especially critical to preventing new problems.

**Target Implementation Date:** January 1, 1995

**Estimated Costs:**

**State Agencies** (University of Minnesota, MPCA): \$60,000 (Guidance development, publication)

**Other** (League of MN Cities, Association of MN Counties): \$50,000 (Workshops, guidance distribution)

**Local Government:** Costs for staff and local officials, to attend workshops

**Possible Funding Sources:** EPA, LCMR, workshop registration fees

#### **RECOMMENDATION #9 - TECHNICAL APPROVAL METHODOLOGY**

A methodology should be developed to facilitate the use of promising innovative alternative on-site treatment systems. Revisions to Chapter 7080 should include a performance standard for the level of treatment required from an onsite treatment system. Systems that consistently meet performance standards would then be allowed under the code.

**Target Implementation Date:** January 1, 1994

**Estimated Costs:** COVERED THROUGH CURRENT ACTIVITIES

#### **RECOMMENDATION #10 - MUNICIPAL FINANCIAL ASSISTANCE**

Efforts to fund on-site systems should be concentrated on municipalities. Although all on-site systems in the state need to be brought into conformance with Chapter 7080, the greatest environmental benefit will be derived from concentrating limited funding sources on problem areas.

**Target Implementation Date:** January 1, 1996

**Estimated Costs:**

**State Agency** (MPCA): \$10,000.00 (Statute and Rule Revisions, corresponding program changes)

*See Recommendation #5.*

*\*Municipalities in this report are defined as cities, counties, townships, watershed districts and sewer districts. Unincorporated areas and other rural areas can all be placed within this definition.*

## THE INDIVIDUAL ONSITE WASTEWATER TREATMENT SYSTEMS GRANT PROGRAM

### PROGRAM PURPOSE

The individual onsite wastewater treatment system grants program provides grants to municipalities to assist owners of individual onsite systems in upgrading or replacing their failed systems. The rules of the program have been changed to: 1.) incorporate the statutory changes made during the 1990 Legislative Session; 2.) reduce the financial risk for municipalities seeking funding; 3.) streamline the application process; and 4.) clarify requirements for alternative planning areas. These new rules became effective in January of 1992.

### GENERAL ELIGIBILITY REQUIREMENTS

#### **Municipality**

- Projects are within the official boundaries of the municipality, OR an alternate planning area has been approved.

*Note: Both municipal and individual eligibility requirements must be met.*

#### **Individual Systems**

##### The system

- is a failed system,
- was constructed before January 1, 1977,
- does not serve a seasonal residence,
- was not constructed with state or federal water pollution control funds, and
- the system is located within the project area.

### APPLICATION PROCESS

#### Requests to be Placed on the Onsite Funding List

Public notice will be made in the State Register when municipalities can submit requests to be placed on the onsite funding list. Further instructions will be published at the time the submittal period is opened.

#### Funding List Ranking

Projects which meet requirements will be ranked in priority order based on the median household income of the municipality or alternate planning area. Once projects are ranked, a determination of fundable projects will be made based on the amount of money available. **Approximately \$313,300 is currently available** for new projects and project amendments. When projects that can be funded are identified, all projects submitting a request for placement on the funding list will be notified.

#### Application

Only municipalities who have been notified that their project is fundable are eligible to submit an application.

### ELIGIBLE COSTS

The Individual Onsite Grants Program will cover **50% of construction costs** per dwelling or other establishment up to a maximum amount of \$2,500 for a trench or bed system, and \$3,750 for a mound system. Cluster systems serving 5 or fewer dwellings are also eligible for grant participation. **Site evaluation and systems design costs** are also **50% eligible** up to a maximum of \$150 per dwelling or other establishment.

### FOR MORE INFORMATION

The program is governed by Minnesota Statutes, section 116.18, subd. 3c and Minnesota Rules sections 7077.0700 to 7077.0765. For additional information on the program please contact:

Victoria Cook	Phone: (612)296-7248 or

520 Lafayette Road, St. Paul, Minnesota 55155	

**INDIVIDUAL ONSITE GRANTS PROGRAM  
APPLICATION CYCLE**

**ONSITE FUNDING LIST** (MN Rules Part 7077.0713)

The onsite funding list will be compiled prior to a grant application period. The list will be used to determine what projects can be funded with the money available. Only these projects will be eligible to submit an application. Requirements for new projects to be placed on the list include:

1. Submission of a **written request** to the commissioner for placement on the onsite funding list;
2. A **resolution** from the municipalities' governing body that (a) designates the municipality as the responsible party for submitting the placement request and future application, (b) authorizes filing the request and future application, and (c) designates the municipal official authorized to sign documents relating to the project;
3. A **map** of the municipal jurisdiction or approved alternate planning area;
4. A **preliminary list** identifying the addresses of the individual systems suspected of failure (or noncompliance) that meet the individual eligibility requirements;
5. **Median household income data** or alternative data that includes income data and computation methodology for municipalities or planning areas not included in the decennial census;
6. An **estimated schedule** of site evaluation, design and construction for all eligible systems;
7. A copy of a **draft ordinance** adopting the requirements of 7080 and establishing a maintenance plan; and
8. The **total estimated eligible cost** for the project.

**PROJECT RANKING** (MN Rules Part 7077.0713, subp. 4)

Project ranking for funding will be based on the approved median household income for the project planning area. Certain project types shall be grouped and prioritized according to the following:

1. **Partial award projects** will be ranked before project increase amendments and new projects;
2. **Project grant increase amendments** will be ranked before new projects; and
3. **New projects.**

**GRANT APPLICATION** (MN Rules Part 7077.0725)

Once projects are notified that they are fundable, a complete application must be submitted, and include:

1. A **wastewater treatment plan** adopted by the municipality's governing body that identifies needs and proposes long-term solutions for a planning area including: (a) a planning area survey prepared by an inspector identifying all systems in the area as failed or in compliance with 7080, (b) site evaluations including all soils work (investigations, borings, and percolation tests for failed systems) prepared by a site evaluator and with a determination on the feasibility of replacing or upgrading the failed systems, (c) a proposed system summary including sizing, location and design, prepared by a designer, (d) a list of the failed systems including names and addresses of property owners who meet the individual eligibility requirements and copies of the abatement notices, (e) an analysis of the overall treatment needs in the planning area including specific actions and a proposed timetable for addressing treatment needs, (f) documentation approving site inspectors evaluator(s), designer and installer, (g) a certification of the wastewater treatment plans adoption;
2. A copy of the **enacted ordinance** that adopts the requirements of Chapter 7080, a maintenance plan for the onsite systems within the municipality's jurisdiction, and certification that the ordinance is being enforced;
3. **Signed statements of compliance** with the individual eligibility requirements from the individual owners;
4. The **amount of grant funding requested** for site evaluation, system design, and construction and a certification stating that only eligible costs have been requested;
5. The **estimated date of completion** of all construction and final request for grant eligible system payment;
6. A statement from the municipality that it has an **inspector on staff or under contract** for services;
7. An assurance from the municipality that **all owners connected to a cluster system agree to be participate** in the project and in financing future operation, maintenance and replacement of the system.

INDIVIDUAL ON-SITE WASTEWATER TREATMENT SYSTEMS  
GRANT PROGRAM

PROGRAM FUNDING STATUS

**A. FUNDING SUMMARY**

Initial program appropriation (1988)	+ \$1,000,000
Additional General Fund appropriation (1990)	+ \$250,000
Governor's state budget reductions (1991)	- \$250,000

<b>SUBTOTAL</b>	<b>\$1,000,000</b>
-----------------	--------------------

Project Grant Awards (both funding cycles)	- \$472,100
--	-------------

<b>SUBTOTAL</b>	<b>\$527,900</b>
-----------------	------------------

Additional Funding (1991 Legis. Session)	+ \$160,000
--	-------------

Proposed General Fund Cuts (biennium)	- \$60,000
---------------------------------------	------------

<b>TOTAL FUNDING AVAILABLE FOR 1992</b>	<b>\$627,900</b>
---	------------------

WLSSD Demonstration Project	- \$40,000
-----------------------------	------------

<b>TOTAL FUNDING FOR 1992 APPLICATIONS</b>	<b>\$587,900</b>
--	------------------

**B. 1992 APPLICATION PERIODS**

**ROUND 1 (Opened 2/18/92)**

Amendment Requests (Lastrup, Rice County)	- \$10,200
---	------------

New Grants

City of Bruno	- \$172,303
---------------	-------------

Hubbard Village	- \$8,108
-----------------	-----------

Nicollet Co. (Klossner)	- \$73,750
-------------------------	------------

<b>TOTAL AVAILABLE FOR ROUND 2</b>	<b>\$323,539</b>
------------------------------------	------------------

**ROUND 2 (Opened 10/19/92)**

New Grants

City of Donaldson	- \$64,000
-------------------	------------

City of West Union	- \$53,878
--------------------	------------

City of Crosslake	- \$97,050
-------------------	------------

Hubbard Twnshp. (So. Long Lake)	- \$22,050
---------------------------------	------------

Chisago Co. (Almelund)	- \$86,561 (Partial Grant)
------------------------	----------------------------

<b>PROGRAM BALANCE</b>	<b>\$0</b>
------------------------	------------

## INDIVIDUAL ON-SITE WASTEWATER TREATMENT SYSTEMS GRANT PROGRAM

### C. PROJECT SUMMARY

**1. RICE COUNTY (Webster Township Planning Area)**

Grant amount **\$156,740**, Approved Budget Period 4/90 - 12/92

Number of systems being replaced - 47

**2. CITY OF BROOK PARK**

Grant Amount **\$108,500**, Approved Budget Period 12/90 - 10/93

Number of systems being replaced - 48

**3. CITY OF BURTRUM**

Grant Amount **\$100,700**, Approved Budget Period 12/90 - 10/93

Number of systems being replaced - 53

**4. CITY OF LASTRUP**

Grant Amount **\$74,000**, Approved Budget Period 5/90 - 6/93

Number of systems being replaced - 51

**5. MILLE LACS COUNTY (Bradbury Township and Section 6 of Onamia Township)**

Grant Amount **\$41,400**, Approved Budget Period 5/90 - 6/92

Number of systems replaced - 32

**6. CITY OF BRUNO**

Grant Amount **\$172,303**, Approved Budget Period 8/92 - 1/95

Number of systems being replaced - 47

**7. HUBBARD TOWNSHIP (Hubbard Village)**

Grant Amount **\$8,108**, Approved Budget Period 8/92 - 7/93

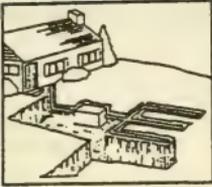

Number of systems being replaced - 5

**8. NICOLLET COUNTY (Klossner Village)**

Grant Amount **\$73,750**, Approved Budget Period 8/92 - 9/93

Number of systems being replaced - 21

## EXECUTIVE SUMMARY

Twenty-seven percent of the housing units in Minnesota are not connected to a public sewer; most of these homes are located in small cities, rural subdivisions and lakeshore areas across the state. The vast majority of the homes have on-site sewage treatment systems (septic systems) which do not conform to minimum standards of treatment and/or design. These nonconforming systems discharge raw or inadequately treated sewage to surface and ground waters, resulting in potentially serious health and environmental consequences.

In 1991, the Legislative Water Commission directed the Minnesota Pollution Control Agency and the Department of Trade and Economic Development to study issues related to the future of wastewater treatment financing in Minnesota. The agencies made several recommendations in February 1992, one of which was to form a committee that would develop approaches for addressing the growing health, environmental and financial needs of unsewered areas. In March of 1992, the Unsewered Area Advisory Committee (UAAC) was formed. The UAAC includes representatives from watershed districts, counties, cities, townships, regional development commissions, private contractors and state agencies.

Through months of research and meetings, the UAAC has attempted to take a comprehensive view of the wastewater treatment needs and related issues faced by unsewered areas. The recommendations contained in this report reflect this comprehensive viewpoint.

Recommendations contained in this report include:

- Implement Individual Sewage Treatment Standards (Mn. Rules Chapter 7080) on a statewide basis to ensure consistent standards regarding on-site systems.
- Require a mandatory certification program for professionals involved in the construction, inspection and maintenance or design of on-site systems.

- Institute a statewide enforcement program to maintain standards.
- Provide maintenance guidance to municipalities for the oversight of on-site systems within their jurisdictions.
- Continue funding the current Individual On-Site Wastewater Treatment Systems Grant Program and support program revisions based on environmental criteria.
- Provide public education on the benefits and importance of conforming on-site systems.
- Provide funding for research.
- Assist municipalities in wastewater planning efforts.

Legislative initiatives covering the first two recommendations have already been drafted, but implementation of all the recommendations is pivotal to addressing the environmental, administrative and financial needs that exist. It is hoped that the coordination between state government, local governments and the private sector that was fostered by the UAAC in making these recommendations will continue in their implementation.

## INTRODUCTION

The Legislative Water Commission reviewed municipal wastewater treatment system financing in Minnesota and made several recommendations during the 1991 legislative session. The Commission then directed the Minnesota Pollution Control Agency (MPCA) and the Public Facilities Authority (PFA) to study the issues that were raised and submit a report of their findings. The report, *Municipal Wastewater Treatment Financing*, was presented to the Legislative Water Commission in February 1992.

One of the issues the Commission directed the MPCA and the PFA to address was the wastewater treatment needs in unsewered areas served by on-site sewage treatment systems. Given the time available and the scope of the problem, only two recommendations regarding unsewered areas were made to the Commission in the *Municipal Wastewater Treatment Financing* report. These were:

1. Individual Sewage Treatment System Standards (Minnesota Rules Chapter 7080) should be implemented statewide; and
2. A task force should be formed to determine the most effective methods to provide technical, administrative and financial assistance to unsewered areas.

In March 1992, the Unsewered Area Advisory Committee (UAAC) was formed. Representatives from local governments (cities, counties, townships, watershed districts), regional development commissions, private firms and state agencies were selected for their backgrounds and interests in resolving problems in unsewered areas (see Appendix 1 for a listing of members). This report is the result of the findings and recommendations of this committee.

## SCOPE OF THE PROBLEM

### Description of the Problem

Twenty-seven percent or 491,925 of the housing units in Minnesota are not connected to a public sewer (unsewered). These figures reflect a 22 percent increase in the number of unsewered housing units between the 1980 and the 1990 census. (A 13 percent increase in the total number of housing units occurred during this time period.) The majority of these unsewered housing units are located in small cities, rural subdivisions and unincorporated areas of the state. In addition, numerous on-site sewage treatment systems are used for seasonal cabins, primarily concentrated in lakeshore areas; other systems are being built on urban lots located within cities.

An informal survey of county planning and zoning administrators conducted by the MPCA indicated that 70 percent of the on-site systems used by households are failing to provide adequate treatment or do not meet minimum state design and treatment standards. This large percentage is due, in part, to the lack of a mandated state standard and the lack of administrative and enforcement initiatives by local governments. Most of these systems were installed without the guidance of environmental protection policies.

Systems not properly treating sewage are described as "nonconforming" in Minnesota Rules Chapter 7080 (Individual Sewage Treatment System Standards). Nonconforming systems are classified as:

1. Failing systems having a surface discharge or backup;
2. Cesspools, drywells, leaching pits or seepage pits;
3. Systems with inadequate depth of soil above limiting soil characteristics (such as bedrock or a seasonally high water table); and/or
4. systems not installed according to all applicable local standards adopted and in effect at the time of the installation.

Nonconforming systems discharge raw or inadequately treated sewage to surface and ground waters, which can result in serious health and environmental consequences.

The effluent (discharge) from an on-site system septic tank contains solids, biological oxygen demand, chemical oxygen demand, phosphorus, nitrogen, chloride, bacteria, pathogens, viruses and organic chemicals. Effluent can also contain volatile organic compounds and other pollutants, which often get flushed down the drain. If wastes are not adequately treated, diseases can be transmitted and ground and surface waters can be contaminated.

## Description of the Need

Issues that typically need to be addressed in unsewered areas include:

1. Public health hazards
2. Ground and surface water pollution
3. Planning and zoning decisions
4. Technical requirements for conforming on-site systems
5. Education
6. Finances

These needs are reflected by the numerous phone calls to MPCA staff requesting assistance in these areas. Phone logs indicate that as many as 300 calls per month have been received. The issues are often further complicated by the presence of geologically sensitive areas, small or otherwise inadequate lots and limited knowledge of on-site sewage treatment by local officials and the public.

Municipalities which have recently requested assistance from the Individual On-Site Wastewater Treatment Systems Grants Program are used to illustrate the problems that exist in unsewered areas (see Appendix 2). These case studies are examples of the problems faced by many small communities throughout the state. There are a few programs that provide assistance to these communities, but they fall short of the needs that exist in the areas of administrative, technical and financial assistance.

## EXISTING PROGRAMS

### Technical and Administrative Programs

#### *Technical Programs*

Minnesota Rules Chapter 7080 (Individual Sewage Treatment System Standards) are the technical standards for the siting, design, construction and maintenance of on-site systems. Counties, or other local governments, voluntarily adopt and enforce these standards. Currently, 33 counties have adopted Chapter 7080 by reference and an additional 15 counties have adopted a similar ordinance county-wide.

In addition, land within 1000 feet of a lake or 300 feet from a river has been designated as "shoreland" by the Minnesota Department of Natural Resources (DNR). Existing on-site treatment systems within these areas are required to meet the provisions of Chapter 7080. These regulations are administered by local governments. All counties, with the exception of Hennepin and Ramsey, have been instructed by the DNR to adopt and implement the shoreland regulations.

#### *Training*

The University of Minnesota and the MPCA jointly provide workshops based on Chapter 7080 for on-site professionals on the proper siting, design, construction, inspection and maintenance of on-site systems. Over 900 professionals attended these workshops in 1992.

The MPCA administers a voluntary certification program for these on-site professionals. Certification criteria include attendance at a training workshop, passing a written examination and fulfilling practical field experience. Recertification is required every three years by fulfilling minimum attendance hours at applicable training programs. The MPCA has certified over 2,000 on-site professionals in the state.

Some local governments, including 25 counties, require MPCA certification for individual on-site system professionals. There is an overwhelming concurrence that requiring certification greatly reduces the number of complaints and the amount of time local governments need to spend addressing nonconforming systems.

Many local governments review, inspect and approve on-site systems. This is typically done by a county planning and zoning or environmental health office, but may be conducted by city or township officials. The range and scope of the local programs differ greatly.

For example, Olmsted County has a comprehensive program wherein it has adopted (and is enforcing) regulations that require:

1. permits for the installation, repair and use of all on-site systems;
2. licensing, bonding and MPCA certification of on-site system professionals; and
3. inspections and approvals of all new construction and repairs to on-site systems.

Other counties do not have county-wide regulations and perform little or no permitting or enforcement activities.

The MPCA reviews plans and specifications and issues permits for on-site systems that receive an average daily flow in excess of 10,000 gallons per day. The Minnesota Department of Health reviews plans and specifications for on-site systems that they regulate (state licensed facilities, buildings serving the public, etc.) with flows of less than 10,000 gallons per day.

#### *Administrative*

The Shoreland Management Grants Program administered by the DNR has made funding available for the implementation of shoreland ordinances. The funding may be used for administrative planning purposes such as doing surveys to locate nonconforming septic systems in a county. Funding for this program may not be available in the future, because of proposed state agency funding cuts. The Board of Water and Soil Resources has a funding program for implementing approved local water plans that could be used for some planning activities, if it relates to the priorities in the local plan.

## **Financial Programs**

### *Individual Programs*

Currently, a variety of programs exist that provide some form of financial assistance (usually loans) to individual homeowners and small businesses to upgrade or replace their

nonconforming on-site systems. The major emphasis of these programs is general property improvement. Income guidelines for many of these programs are strict, only providing assistance to homeowners with extremely low incomes.

These individual programs include two programs offered by the Farmers Home Administration, and three programs offered by the Minnesota Housing Finance Agency. The Housing Finance Agency also offers a loan program for rental property owners that covers multiple family dwellings, and the Minnesota Department of Trade and Economic Development offers a loan program for some tourism-related businesses.

### *Municipal Programs*

Many municipalities that need financial assistance to fund construction of on-site treatment systems have limited resources. Application processes and administrative requirements for some programs are difficult hurdles for many small municipalities. Planning assistance may be directly available through local Regional Development Commissions or Community Action Programs. (See Administrative section above.)

At this time, only one program exists solely for the purpose of funding on-site systems. The Individual On-Site Wastewater Treatment Systems Grants Program administered by the MPCA and the PFA provides approximately 50 percent grants to municipalities for site evaluation, design and construction of on-site treatment systems.

The State Revolving Loan Program offers low-interest loans for planning, design and/or construction of wastewater treatment facilities. State legislation was passed in 1992 establishing the Wastewater Infrastructure Fund (WIF) to provide supplemental financial assistance to the existing State Revolving Loan Program.

Rules governing the WIF are currently being written by the MPCA and the PFA. The proposed rules governing the fund will increase the chances for funding projects in unsewered areas by making such projects more competitive with projects in sewered areas. These rules create a new environmentally based criteria for ranking projects on a needs list that takes into account the specific problems in unsewered areas. The fund

will be jointly administered by the MPCA and the PFA.

Please refer to Appendix 3, "Financial Assistance Programs for Individual and Municipal Sewage Treatment Needs," for a summary of available programs in Minnesota.

## RECOMMENDATIONS

When asked "Who should administer programs to provide assistance in unsewered areas?" the general consensus from the UAAC members was that it should be the unit of government closest to the problem. Many of the following recommendations could be administered by local governments, especially at a county level. At present, a number of counties already have programs that cover some of these activities.

Another point that was agreed upon by a majority of the UAAC members, especially the ones representing local governments, was that if the state delegates any environment programs or mandates any new activities to be performed by local governments, then the state should provide financial support to administer the activities. To support even the administrative part of a county-based financial assistance program to unsewered areas would cost the state in excess of \$1 million per year (based on 1/4 staff person per county).

In order to provide the necessary guidance and support to local units of government, the legislature needs to support state government activities. State guidance, technical support and administrative support will also be needed for local government programs.

The UAAC established and prioritized the following recommendations. The first two recommendations need to be implemented immediately in order to provide overall structure and statewide consistency which will set the framework for addressing on-site sewage treatment problems.

### 1. Statewide Standards (Chapter 7080)

Legislation should be enacted that requires Minnesota Rules Chapter 7080 be implemented statewide to provide consistent standards for the design, location, installation

and maintenance of individual on-site systems.

### 2. Mandatory Certification Program

Legislation should be enacted requiring a mandatory certification program for on-site professionals. This will greatly reduce the number of inadequate on-site systems located, installed, designed, inspected and maintained by unqualified individuals. This will also prevent underbidding by unqualified contractors.

### 3. Statewide Enforcement

Legislation should also be enacted for a statewide enforcement program to provide a mechanism for bringing all on-site systems in the state up to code by the year 2005. On-site systems should, at a minimum, be inspected whenever there is a property transfer, before a building permit is issued, and if there is a complaint or nuisance condition. Nonconforming on-site systems would then be upgraded or replaced within a specified period of time in order to protect public health and the environment.

### 4. Maintenance Programs

Maintenance guidance should be provided to municipalities for the oversight of the on-site treatment systems within their jurisdictions. Municipalities should be required to track system maintenance by using a reporting system, or the municipalities could contract to have the systems maintained and bill the residents for the service.

### 5. Continuation of Current Funding Program

The Legislature should continue to support the current Individual On-Site Wastewater Treatment Systems Grant Program until a revised program, using environmental priorities, can replace it.

(See Related Issues)

## 6. Education

For many of the recommended solutions to be effective, education on the benefits and importance of conforming systems is necessary. People must be made aware that they are ultimately responsible for all the wastes they generate. Unlike the recycling of household wastes, on-site system problems haven't had the benefit of advertising campaigns and mass marketing. It's more difficult to illustrate the detrimental effects of pathogens (microscopic organisms that cause disease) than to show how our garbage is filling up the landfills.

There are three primary target groups that must be reached.

### a. Decision-makers

County commissioners, township boards, city councils and other local government decision-makers need to be educated due to their important role in resolving on-site system problems. Planning and zoning considerations, permitting, enforcement and incentive strategies are some of the key issues.

### b. General public

Educational materials need to be developed that target the public in unsewered areas so they understand the importance of these issues. For example, Mayor Douglas Blechinger of the City of Bruno had attempted over several years to convince the city of the need to resolve on-site system problems. Most of the city residents could not be convinced, until information about a homeowner who was ill as a result of a contaminated well became known. The attitude of many homeowners regarding on-site systems is that if sewage is not backing up in their basements or flowing in their yards, then there is no problem.

The University of Minnesota Extension Service could use their large information network to distribute educational materials such as fact sheets, videos or other media. Information could also be developed by state agencies and provided to local municipalities for distribution.

Providing information to the general public on the availability of financial assistance programs is also needed. This information could be provided by municipalities that are enforcing on-site system ordinances. Agencies that administer these programs should coordinate their public information activities to provide this information.

### c. Special groups

The banking and real estate communities need to be targeted as special groups. Mortgage/lending institutions need to understand how on-site treatment systems work, what a nonconforming system is, and who can inspect and approve systems. This education is especially important if on-site systems are to be brought into conformance at point of sale.

## 7. Research

Legislation should include funding for research in on-site wastewater treatment. Research would include investigation of alternative and possibly lower cost designs; and provide better data regarding siting, design and proper management of on-site systems in Minnesota's soils and climatic conditions.

A progressive research program is necessary to update the on-site training workshops and to provide the basis for additional education and technology improvements. Research is critical to verify decisions, identify potential problems and maximize the effectiveness of on-site systems. For this type of program to be effective, it must be coordinated and specific to the on-site industry. Funding must be provided to ensure that long-term testing and ongoing research occur.

Research should be coordinated by the University of Minnesota which is already involved in national on-site treatment research. Maintaining a primary focus, coordinating with the on-site industry and assimilating the information into the workshops for on-site professionals are key to the implementation of research results.

## 8. Planning Assistance

Planning assistance is also needed for municipalities. Determining whether on-site systems are the best environmental and most cost-effective solution for wastewater treatment is a difficult problem for the numerous municipalities which lack expertise in this area.

Planning for new development is especially critical to prevent new problems and to keep existing problems from getting worse.

New development planning should include site evaluation and subdivision review requirements to minimize the pollution threat from a high density of on-site systems and the disturbance of identified system locations. Requirements for new development will ensure successful treatment can take place before construction begins.

In order to provide effective treatment, on-site systems must be built on original soils. This means that treatment system locations must be identified and undisturbed prior to construction. Heavy equipment used during construction compacts the soil and can ruin its treatment capabilities.

A correctly built, operated and maintained on-site treatment system will last 20 or more years. Requiring two sites will allow adequate room for system replacement in the future.

Ideally, new development requirements should include:

- a. Minimum lot sizes and housing density;
- b. Two undisturbed suitable on-site system sites per lot;
- c. Site and grading plans which identify on-site systems; and
- d. Staking for on-site system areas.

## 9. Technical Approval Methodology

The MPCA, the University of Minnesota, and the Individual Sewage Treatment Systems Committee should develop a methodology to facilitate the use of promising innovative alternative on-site treatment systems.

Revisions to Minnesota Rules Chapter 7080 should include a performance standard for the level of treatment required from an individual sewage treatment system. Systems that consistently meet these performance standards would then be allowed under the code.

Alternative technology systems that provide a greater removal of nitrogen (denitrification), handle problem soil conditions and that work for small lots are technical priorities.

Coordination with local governments will be of primary importance in any approval of innovative alternative systems. The University of Minnesota Extension Service and the MPCA have the technical expertise, but local governments have the permitting authority. Responsibility and liability issues, such as who is responsible when a system fails to provide adequate treatment, must also be considered.

## 10. Municipal Financial Assistance

For the purpose of this report, municipalities are defined as cities, counties, townships, watershed districts and sewer districts. Unincorporated areas and other rural areas can all be placed within this definition.

Efforts to fund on-site systems should be concentrated on municipalities. Although all on-site systems in the state need to be brought into conformance with Minnesota Rules Chapter 7080, the greatest environmental benefit will be derived from concentrating limited funding sources on problem areas. Municipality-based projects will do the best job of resolving on-site system pollution problems, because all nonconforming systems within an area can be corrected and maintained with direct municipal oversight. The local municipality is also best able to determine problem areas.

MPCA's existing Individual On-site Wastewater Treatment Systems Grants Program provides grants to municipalities to assist in the replacement or upgrade of nonconforming individual on-site systems and small cluster systems (up to five

connections). The program funds up to 50 percent of the construction, site evaluation and design costs.

We recommend that a municipality-based program be offered that makes revisions to the present program as follows:

- a. Rank projects based first on environmental priority, and then on the financial capability of the community;
- b. Provide eligibility for seasonal residences (50 percent grant for permanent residences, 25 percent for seasonal residences);
- c. Allow up to five percent of total grant funding for municipal administrative costs; and
- d. Provide eligibility for the use of holding tanks as a last resort with the development of a maintenance plan.

## RELATED ISSUES

### Environmental Priority System

A priority system should be developed to concentrate on the most severe environmental problems. This system could be used to evaluate the environmental need in specific areas so that financial, technical and administrative assistance could first be provided in the areas with the greatest need. A priority system should evaluate and rank the following factors in the area to be served:

1. Percentage of nonconforming on-site systems;
2. System density (lot sizes);
3. Drinking water well setback (distance from the on-site system) problems;
4. Percentage of systems with surface discharges;
5. Depth to the high water table;
6. Other soil limiting factors such as fractured bedrock, dense clay, sugar sand, etc.;
7. Distance to a public sewer system with

capacity to accept the municipality's waste;

8. Resource value of the impacted water(s) of concern;
9. Impacted waters with identified water quality violations;
10. Priority of the project in county's Local Water Plan; and
11. Priority of the impacted waters as identified in future MPCA basin planning efforts.

### Injection Wells

The technical subcommittee of the UAAC addressed a related issue that is currently under federal scrutiny: underground injection (disposal) wells (Class IV and Class V wells). Any type of underground disposal device (drywell, cesspool, on-site system, french drain, etc.) which receives industrial/commercial wastewater, stormwater or domestic waste from more than 20 persons per day is classified by the U.S. Environmental Protection Agency (EPA) as an injection well. Concerns have been raised because on-site systems effectively treat individual domestic waste, but cannot treat most non-domestic and hazardous contaminants.

Any type of underground disposal device which receives hazardous waste is defined as a Class IV well and is banned under both the hazardous waste regulations and the underground injection control regulations. Most other underground disposal devices in Minnesota are considered Class V wells. Class V wells include large, domestic-only systems and individual on-site systems that discharge non-domestic waste. Cessation of the discharge, either by modifying building plumbing or installation of a holding tank, is required if contamination is likely. Some types of discharges may be allowed, but require approval (usually in the form of permits) from both EPA and MPCA.

Many rural communities have facilities which dispose of wastewater into Class V wells, and possibly into Class IV wells. These can be found in school bus barns, county highway garages, small manufacturing facilities, beauty shops, medical clinics and apartment buildings. Technical guidance and education are needed to promote use of wastewater management

alternatives which have less environmental impact.

### Water Conservation

Water conservation measures need to be encouraged. Water conservation measures are difficult to instill in Minnesota residents because water is perceived as abundant. Education is necessary to inform the general public how excess water affects the construction costs and life of an on-site system.

Other agencies have seen the need for water conservation measures. The plumbing code has been modified effective July 1, 1993, requiring all new homes that are constructed to install 1.6 gallon low-flow, floor-mounted toilets. The State Energy Code (MS 216C.19) requires 2.5 gallons per minute shower and kitchen faucets to be installed.

Olmsted County has adopted a progressive county-wide program endorsing a four step approach to wastewater: reduce, recycle/reuse, treat and dispose. These are further described by the county as follows:

1. Reduce—Minimize the volume of wastewater through water conservation and diversion of household hazardous waste;
2. Recycle/Reuse—Recover nutrients through the composting of kitchen and toilet wastes, applying septage and sludge as fertilizer, and the collection and product exchange of household hazardous wastes;
3. Treat—Treating the remaining wastewater through community and individual treatment systems that maximize nutrient recovery and minimize pollutant discharge to surface and ground water; and
4. Dispose—Disposing of the remaining wastewater products through dilution or isolation.

For water conservation purposes, incentives to install low-flow water-saving devices could be used and state guidance and education could be implemented to encourage a program similar to Olmsted County's.

### Septage

The proper maintenance of on-site treatment systems requires the removal, by pumping, of the solids that have accumulated in the septic tank. The product of this pumping is termed septage. It is estimated that 164 million gallons of septage would be generated per year if all systems in the state were properly maintained. Improper disposal of this material can result in contamination to ground and surface waters and soils.

The majority of septage is land applied to agricultural fields. The second most common disposal method is treatment at the local wastewater treatment plant. In many areas, the local treatment plant does not have the capacity to accept the extra-strength wastes contained in septage. Currently, there are no state rules and few local ordinances regulating the proper land application of septage. However, the MPCA and University of Minnesota have a training and certification program for pumpers. Some counties require that pumpers be certified to work within their jurisdictions.

The EPA has recently issued the revised regulations dealing with land application of municipal sewage sludge. These regulations now include the disposal of septage. Currently, the MPCA regulates the land application of sewage sludge. A decision has not yet been made on how the MPCA will deal with these revised regulations with regard to septage.

It is generally felt that there are no serious problems with how the majority of pumpers currently spread septage; however, the MPCA does receive complaints concerning improper land application methods. The proper disposal of septage needs to be addressed in dealing with wastewater treatment needs in unsewered areas.

### Other Financial Issues

As noted previously, there are several programs that provide financial assistance directly to individual homeowners and small businesses to upgrade or replace their nonconforming on-site systems. However, many of these home improvement programs have waiting lists of up to four years.

Because of the variety of individual assistance programs available, the UAAC is not recommending the creation of a separate program for funding individual on-site systems. However, through state and local agency coordination, having a certain percentage of funding set-aside for on-site systems should be investigated further. Continued state and federal support of these programs are necessary.

Another option would be to provide tax incentives for individuals that have upgraded or replaced their on-site systems with a conforming system. For example, 10 percent of the cost of the system could be used as a tax deduction.

## IMPLEMENTATION STRATEGIES

Many activities that are required for implementation of some of the recommendations that follow can be self-supporting. User fees are the most common source of revenue for local governments currently administering on-site system programs.

For example, Isanti County has adopted Minnesota Rules Chapter 7080. The county has a self-supporting program in which all on-site systems in shoreland areas must be brought up to code when property is transferred or whenever property improvements that require a building permit are needed. When these activities occur,

the county performs an on-site system inspection. Inspection fees from the property owners cover these costs.

Isanti County also licenses on-site system professionals. These professionals must be certified by the MPCA and obtain a \$5,000 bond. Fees vary from \$25 for site evaluators to \$100 per year for system installers. The program administered by Isanti County has been self-supporting for three years. This year, fees collected have generated excess revenue.

### ■ Recommendation #1—Require Statewide Standards (Chapter 7080)

Legislation would require counties to adopt and administer state standards for design, location, installation and maintenance (Minnesota Rules, Chapter 7080).

Target Implementation Date: January 1, 1995

Estimated Costs:

- Local Governments  
\$300 - \$600 (Ordinance adoption)  
unknown (Ordinance administration)

Possible Funding Sources: System permit fees could cover all costs, making this a self-supporting program.

### ■ Recommendation #2—Mandatory Certification Program

Legislation would require MPCA certification of all site evaluators, designers, installers, inspectors and pumpers. After initial certification, individuals would be recertified every three years.

Target Implementation Date: July 1, 1994

Estimated Costs:

- Local Governments  
\$60 per year per person (Staff certification/training)  
\$40 per year per person (Travel, lodging, miscellaneous expenses while attending training)
- Private Contractors  
\$60 per year per person (Staff certification/training)  
\$40 per year per person (Travel, lodging, miscellaneous expenses while attending training)
- State Agency (MPCA)  
\$180,000 per year (3 agency staff, salaries, supplies and expenses)

## Recommendation #2—Mandatory Certification cont.

### Possible Funding Sources:

- System permit, inspection and contractor licensing fees (local government)
- Contractor billings to clients
- Certification fees (MPCA)

The various fees above could cover all costs, making this a self-supporting program.

## ■ Recommendation #3—Statewide Enforcement

Legislation would require local governments to implement an enforcement program that would require all nonconforming systems be brought up to code.

**Target Implementation Date:** January 1, 1995

**Target Completion Date:** January 1, 2005 (All systems up to code)

### Estimated Costs:

- Local Governments (Counties)
  - \$50 - \$100 per system (Inspection)
  - \$10 - \$15 per system (Survey of nonconforming systems)
  - \$60 - \$100 per system (Enforcement action)
- Individuals (Homeowners, small businesses, etc.)
  - \$2,000 to \$10,000 (Replacement of nonconforming systems)

### Possible Funding Sources:

- System permit, inspection fees (local government)
- Enforcement penalties
- DNR Shoreland Management Grants (surveys, other planning)
- MPCA/PFA Individual On-site Wastewater Treatment System Grant Program
- MPCA/PFA State Revolving Loan Funds
- Home improvement loans
- Other private loans

#### ■ Recommendation #4 - Maintenance Program

Overall guidance is needed for municipalities to oversee proper maintenance of on-site systems.

Target Implementation Date: January 1, 1996

##### Estimated Costs:

- State Agencies (University of Minnesota Extension, MPCA and DNR)  
\$10,000 (Guidance development, publication and distribution)
- Local Governments  
\$1,000 (Start-up costs, education)  
\$100 - \$500 per year (Ongoing tracking, administration)
- Individuals  
\$25 - \$50 per year (Septic tank pumping and maintenance every three years)

##### Possible Funding Sources:

- Fees from pumpers (local governments)
- U.S. Environmental Protection Agency (educational programs)
- Legislative Commission on Minnesota Resources (educational programs)

#### ■ Recommendation #5—Continuation of Current Funding Program

Continuation of the Individual Wastewater Treatment Systems Grants Program will provide the best resolution of problems in an area. Funding is necessary to provide incentives and direction for municipalities to bring all systems into conformance.

Target Implementation Date: July 1, 1993 (1993/1994 Biennium)

##### Estimated Costs:

- State Agencies (MPCA, PFA)  
\$1,000,000 per year (Grants to municipalities - based on average cost of \$100,000 per project)  
\$80,000 per year (1 1/4 staff, salaries, supplies and expenses)
- Local Governments  
\$1,000 - \$5,000 per project (Administration)
- Individuals  
\$1,000 - \$5,000 per system (50 percent for the amount the grant doesn't cover.)

##### Possible Funding Sources:

- State Legislature (grants program)
- Municipal bonds
- Home improvement loans
- Other private loans (costs grant doesn't cover.)

### ■ Recommendation #6 —Education

Education is the key to success in attaining the goal of conforming on-site systems statewide.

**Target Implementation Date:** January 1, 1995

**Estimated Costs:**

- State Agencies (University of Minnesota Extension, MPCA)  
\$10,000 (Education program development)
- \$20,000 (Video, copying, distribution)
- \$20,000 (Public outreach to target groups)

**Possible Funding Sources:**

- U.S. Environmental Protection Agency
- Legislative Commission on Minnesota Resources (educational programs)
- video rental fees

### ■ Recommendation #7—Research

Legislation should include funding for research to support investigation of innovative on-site systems and maximize effectiveness of systems in Minnesota's soil and climate.

**Target Implementation Date:** April 1, 1995

**Estimated Costs:**

- University of Minnesota Extension  
\$250,000 per year (Research development, start-up and ongoing projects)

**Possible Funding Sources:**

- Legislative Commission on Minnesota Resources
- U.S. Environmental Protection Agency
- private industry

### ■ Recommendation #8 —Planning Assistance

Planning assistance to local governments is crucial if they are to develop adequate plans to address current and future wastewater treatment needs.

**Target Implementation Date:** January 1, 1995

**Estimated Costs:**

- State Agencies (University of Minnesota, MPCA)  
\$60,000 (3 agency staff, guidance development, publication)
- Other (League of Minnesota Cities, Association of Minnesota Counties)  
\$50,000 (Workshops, distribution)

**Recommendation # 8 cont.**

- Local Government  
Costs for staff and local officials, to attend workshops

**Possible Funding Sources:**

- Legislative Commission on Minnesota Resources
- Workshop registration fees

**■ Recommendation #9 — Technical Approval Methodology**

A technical approval methodology should be created that will review innovative systems. Performance standards should be added to Minnesota Rules Chapter 7080, and used as the basic criteria for this review.

**Target Implementation Date:** January 1, 1994

**Estimated Costs:** Costs can be covered through current activities.

**■ Recommendation #10 — Municipal Financial Assistance**

The greatest environmental benefits will be reached by concentrating on resolving problems on a municipality-wide basis. Revisions to the Individual On-site Wastewater Treatment Systems Grant Program will make environmental priorities the major focus.

**Target Implementation Date:** January 1, 1996

**Estimated Costs:**

- State Agency (MPCA)  
\$10,000 (Statute and rule revisions, corresponding program changes)  
See Recommendation #5

**Possible Funding Sources:**

- State Legislature

## CONCLUSION

Like many nonpoint source pollution issues, wastewater from individual on-site sewage treatment systems is generated from many diffuse sources. Each individual source may not be generating large amounts of pollution, but the cumulative effect of over 340,000 nonconforming on-site systems in Minnesota is a major concern.

Conforming on-site sewage treatment systems that adequately treat wastes is the ultimate goal of the recommendations contained in this report. In order for this to be accomplished, we need a multi-faceted, comprehensive approach to deal with the wastewater treatment needs in unsewered areas. Support and coordination at all levels of government is necessary to implement these recommendations and make this goal a reality.

## Appendix 2

## UNSEWERED AREA CASE STUDIES

**City of Bruno**

The City of Bruno, population 130, is located in north central Pine County. Bruno consists of 45 single family homes, three churches, three small businesses (gas station, hair salon, bar), a post office, an elementary school and a senior citizen's center. Individual on-site systems service the entire City. All of these systems are nonconforming and need to be replaced.

Drinking water is obtained from individual wells. One homeowner has been diagnosed as having health problems directly related to the contamination of her well by her on-site system, and other homeowners have complained of odors and scum appearing in their water. The City is participating in the On-site Grants Program to resolve their on-site problems by constructing new, conforming on-site treatment systems.

**Klossner**

The community of Klossner, population 62, is part of Lafayette Township and located in Nicollet County. Klossner consists of 21 single family homes, six small businesses and two government buildings. Of the 28 on-site systems that serve the community, 25 are nonconforming. Of these nonconforming systems, nine have septic tanks that are piped to the county tile and ditch system allowing inadequately treated sewage to flow into the Minnesota River.

Nicollet County is sponsoring a project to construct new, conforming on-site systems through the On-site Grants Program to resolve the problems in Klossner. County staff have informed the MPCA that there are several other areas like Klossner in the county that need assistance.

**Middleville Township**

Middleville Township is adjacent to the City of Howard Lake in Wright County. The Town Board requested assistance through the On-site Grants Program for a portion of the Township that consists of 40 single family homes on the southeast shore of Howard Lake.

All of these homes have nonconforming systems. Of the 40 homes, 25 have septic tanks that are piped to a tile line or ditch, both of which flow into Howard Lake. The other 15 are piped directly to the lake. According to the Town Board, no septic tank maintenance has been done by the homeowners. Subsequently, untreated (raw) sewage is being discharged directly or indirectly into Howard Lake.

The Middleville Town Board approached the MPCA for financial assistance to replace the existing nonconforming systems with new on-site cluster systems; however, proposed annexation by the City of Howard Lake has halted the project. A majority of Township residents signed petitions in favor of the annexation. In a December 1992 ruling, the annexation of this area of Howard Lake was approved.

The City of Howard Lake intends to run sewer and water lines around much of the lake. The sewage will be transported and treated at the City's Class B wastewater treatment plant if the City can obtain financial assistance for the construction of the sewer and water lines.

**FINANCIAL  
ASSISTANCE  
PROGRAMS**

**for**

**Individual and  
municipal sewage  
treatment needs**

## FINANCIAL ASSISTANCE PROGRAMS

## INTRODUCTION

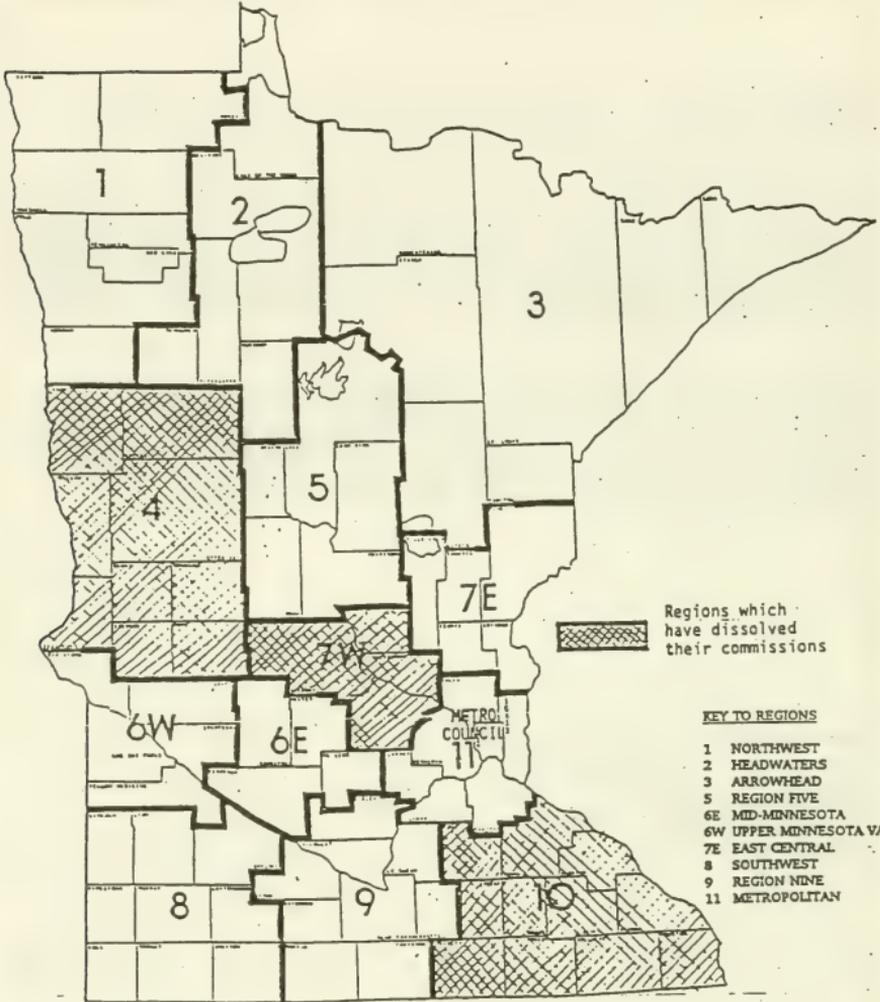

The financial assistance programs listed in this pamphlet will fund either municipal wastewater treatment type projects or individual on-site treatment system type projects, although these projects will not be the primary purpose of some programs. The intention of compiling this pamphlet was to provide general information on a variety of possible funding sources for interested parties to pursue on their own.

There may be other financial assistance programs available in your area. Regional Development Commissions, Community Action Councils, local counties, watershed districts and/or rural cooperatives may have information on additional funding sources. Listings of Regional Development Commissions and Community Action Councils (including Community Action Programs, Housing and Regional Development Agencies, etc.) follow this introduction.

## FINANCIAL ASSISTANCE PROGRAMS

TOURISM LOAN PROGRAM  
Minnesota Department of Trade & Economic Development

- PURPOSE/DESCRIPTION:** To provide low-interest financing to existing tourism-related businesses that provide overnight lodging.
- ELIGIBLE APPLICANTS:** Corporations, sole proprietorships or partnerships who are engaged in an existing tourism-related business providing overnight lodging, including: resorts, bed and breakfast inns, cabins or cottages, hotels, motels, ski lodges and ski resorts, campgrounds and recreational vehicle parks.
- PROJECT ELIGIBILITY:** New building construction and renovation, site preparation, and other construction that will enhance property value and increase customer satisfaction, and equipment. The program does cover septic systems.
- FINANCIAL ASSISTANCE:** Two types of assistance are available.
- Participation Loans - State funds are used in conjunction with loaned funds from financial institutions.
- Direct Loans - Only proposed projects of under \$10,000 may receive a direct loan. The borrower must fund 50% of the project with private financing.
- The base interest rate for the state's loan is fixed at the average yield rate for U.S. Treasury notes of comparable maturity. The actual interest rate is two percentage points less than the base rate. The state's interest rate is fixed for the term of the loan.
- The interest rate for the bank's loan is negotiated between the bank and the borrower. All loans are secured by collateral and personal guarantee.
- CURRENT FUNDING:**
- FUNDING SOURCE:** Department of Trade and Economic Development
- ASSISTANCE AMOUNT:** The maximum direct loan is \$5,000. The maximum state loan may not be for more than 50% of the total project cost or \$50,000, whichever is less.
- APPLICATION DATES:** Open on a year-round basis through the Community Development Division's single application process.
- CONTACT:** Department of Trade & Economic Development

## FINANCIAL ASSISTANCE PROGRAMS

RENTAL REHABILITATION LOAN PROGRAM  
Minnesota Housing Finance Agency

- PURPOSE/DESCRIPTION: Property improvement loans for residential rental property.
- ELIGIBLE APPLICANTS: Residential rental property owners whose property is occupied primarily by low to moderate income tenants.
- PROJECT ELIGIBILITY: Most basic improvements are eligible to be financed. Conversion from nonresidential use to residential use is not permitted, nor is the construction of additional dwelling units. This loan is AVAILABLE only in CERTAIN SELECTED AREAS OF THE STATE.
- FINANCIAL ASSISTANCE: Installment loans are available at the simple interest rate of 7.45%. Maximum loan term is 15 years. Loans over \$5,000 are secured with a mortgage.
- CURRENT FUNDING: \$1,500,000 per year
- FUNDING SOURCE: Minnesota Housing Finance Agency
- ASSISTANCE AMOUNT: Up to \$15,000 in financing may be available per single family structure. Up to \$8,000 per unit may be available for multiple family structures, up to a maximum of \$40,000 per structure. Loans are not assumable and are due upon sale of the property.
- APPLICATION DATES: Open
- CONTACT: Greg Baron  
Minnesota Housing Finance Agency  
400 Sibley Street, Suite 300  
St. Paul, Minnesota 55101  
(612)297-3123

## FINANCIAL ASSISTANCE PROGRAMS

DEFERRED LOAN PROGRAM  
Minnesota Housing Finance Agency

- PURPOSE/DESCRIPTION:** To assist low-income homeowners in financing home improvements which directly affect the safety, habitability, energy efficiency, and accessibility of their homes.
- ELIGIBLE APPLICANTS:** Borrower's total household income after adjustments may not exceed \$8,500 per year. The value of the borrower's assets, after certain exclusions, cannot exceed \$25,000.
- PROJECT ELIGIBILITY:** Owner-occupied properties that contain no more than two dwelling units and will be reasonably safe, habitable, and energy efficient for the term of the loan. Most basic and necessary improvements may be financed.
- FINANCIAL ASSISTANCE:** Zero interest, deferred loans which are forgiven after ten years, unless the borrower sells, transfer, or ceases to live in the property during that ten year period.
- CURRENT FUNDING:** \$8,600,000 (1992-1993)
- FUNDING SOURCE:** Minnesota Housing Finance Agency
- ASSISTANCE AMOUNT:** Up to \$9,000 may be borrowed.
- APPLICATION DATES:** Open
- CONTACT:** Sue Ude  
Minnesota Housing Finance Agency

REVOLVING LOAN PROGRAM  
Minnesota Housing Finance Agency

PURPOSE/DESCRIPTION: To provide rehabilitation financing to low and moderate income homeowners who are unable to qualify for other types of assistance.

ELIGIBLE APPLICANTS: Owner-occupants with adjusted incomes of \$15,000 or less in the seven-county metro area, or \$12,000 or less in Greater Minnesota. Applicants may not have assets in excess of \$25,000 (certain assets excluded) and cannot be eligible for other housing rehabilitation financing programs.

PROJECT ELIGIBILITY: Owner-occupied housing of no more than two units; manufactured housing may also be eligible.

FINANCIAL ASSISTANCE: Installment loans with an interest rate of 3%. Maximum loan term is 15 years.

CURRENT FUNDING: \$2,500,000

FUNDING SOURCE: Minnesota Housing Finance Agency

ASSISTANCE AMOUNT: Maximum loan is \$9,000. Additional loans may be possible after two years; total to a borrower cannot exceed \$15,000.

APPLICATION DATES: Open

CONTACT: Sue Ude  
Minnesota Housing Finance Agency  
400 Sibley Street, Suite 300

## FINANCIAL ASSISTANCE PROGRAMS

THE GREAT MINNESOTA FIX-UP FUND  
Minnesota Housing Finance Agency

- PURPOSE/DESCRIPTION:** To assist homeowners in increasing the livability and energy efficiency of their existing housing by providing property improvement loans.
- ELIGIBLE APPLICANTS:** Owner who occupies the property to be improved and has an ability to repay the loan. Annual household income cannot exceed \$41,000.
- PROJECT ELIGIBILITY:** Most improvements which increase the livability or energy efficiency of a home are eligible. Ineligible improvements include: swimming pools, patios, decks, fireplaces, and other recreational or entertainment facilities. Home must be owner-occupied and consist of no more than four units. Mobile homes and trailers are not eligible unless they are fixed on a permanent foundation and taxed as real property.
- FINANCIAL ASSISTANCE:** Installment loans with an interest rate of 3%, 5%, 7%, 9%, or 9.75%, based on the projected income of the household at the time of loan application.
- CURRENT FUNDING:** \$18,000,000 per year
- FUNDING SOURCE:** Minnesota Housing Finance Agency
- ASSISTANCE AMOUNT:** Maximum loan amount is \$15,000; maximum term of 15 years. Loans are not assumable and are due upon sale of the property. Loans over \$2,500 must be secured with a mortgage.
- APPLICATION DATES:** Open
- CONTACT:** Kathy Dipprey Aanerud  
Minnesota Housing Finance Agency  
400 Sibley Street, Suite 300  
St. Paul, Minnesota 55101

## FINANCIAL ASSISTANCE PROGRAMS

SINGLE FAMILY HOUSING HOME OWNERSHIP LOANS (502) PROGRAM  
 U.S. Department of Agriculture  
 Farmers Home Administration (FmHA)

PURPOSE/DESCRIPTION: Loan funds may be used to build, buy, improve or repair homes in rural communities.

ELIGIBLE APPLICANTS: Low-to-moderate income families in rural communities with an adjusted income within county limits.

PROJECT ELIGIBILITY: After improvements are made, the home must be structurally sound, functionally adequate, and meet health, safety and energy conservation standards.

FINANCIAL ASSISTANCE: Loans are based upon repayment ability of applicant.

CURRENT FUNDING:

FUNDING SOURCE: U.S. Department of Agriculture

ASSISTANCE AMOUNT: Determined by applicant family affordability.

APPLICATION DATES: On-going.

CONTACT: County FmHA offices

## FINANCIAL ASSISTANCE PROGRAMS

RURAL HOUSING LOANS/GRANTS (504) PROGRAM  
 U.S. Department of Agriculture  
 Farmers Home Administration (FmHA)

PURPOSE/DESCRIPTION: Funds are used to assist very low income homeowners to repair or improve their homes by removing health and safety hazards.

ELIGIBLE APPLICANTS: Owner-occupant of a single-family dwelling located in an FmHA eligible rural area.

PROJECT ELIGIBILITY: Installation/repair of water and sewer systems in addition to code improvements, energy conservation measures and other non-cosmetic rehabilitation activities.

FINANCIAL ASSISTANCE: Loans at 1% interest with maximum 20 year term. Grants to be repaid if property sold within 3 years.

CURRENT FUNDING:

FUNDING SOURCE: U.S. Department of Agriculture

ASSISTANCE AMOUNT: Maximum of \$15,000, grant amount not to exceed \$5,000.

APPLICATION DATES: On-going.

CONTACT: County FmHA offices

## FINANCIAL ASSISTANCE PROGRAMS

TACONITE TAX RELIEF AREA GRANT PROGRAM  
Iron Range Resources and Rehabilitation Board (IRRRB)

- PURPOSE/DESCRIPTION:** To leverage local, state, federal and private funds to support community development and the economic growth of the Taconite Tax Relief Area. Grants will be awarded to eligible local units of government and non-profit organizations to help them address their most critical community/economic development needs.
- ELIGIBLE APPLICANTS:** Cities, Townships, Counties, Indian Tribal Governments, and Non-profit Organizations located within the Taconite Tax Relief Area.
- PROJECT ELIGIBILITY:** All projects will be evaluated on a project-by-project competitive basis, and will be reviewed on the following criteria:
- |                      |   |
|----------------------|---|
| <b>JOBS</b>          | The direct or indirect retention or creation of employment opportunities.                   |
| <b>LEVERAGE</b>      | The leverage of respective funding sources compared to total project costs.                 |
| <b>RELATIVE NEED</b> | The project's degree of need or urgency as compared to total project costs.                 |
| <b>IMPACT</b>        | The impact of the project on the region and the area most directly served by the applicant. |
| <b>VIABILITY</b>     | The financial, economic and technical feasibility of the project.                           |
- FINANCIAL ASSISTANCE:** There is no set percentage for IRRRB grants. Projects are partially evaluated on the combination of funding - local, other state, federal, etc. that will contribute.
- CURRENT FUNDING:**
- FUNDING SOURCE:** IRRRB
- ASSISTANCE AMOUNT:** Grant awards for a single project are limited to a maximum of \$250,000 in a single one-year funding cycle. Projects will receive funding for a maximum of two funding cycles or \$500,000.
- APPLICATION DATES:** A project profile must be submitted and approved before any formal application is made. Project profiles may be submitted January 1 through April 15 each year.
- CONTACT:** Iron Range Resources and Rehabilitation Board  
Community Development Division  
P.O. Box 441  
Highway 53 South  
Eveleth, Minnesota 55734-0441  
(218)744-2993

## FINANCIAL ASSISTANCE PROGRAMS

SMALL CITIES DEVELOPMENT PROGRAM  
Minnesota Department of Trade & Economic Development

- PURPOSE/DESCRIPTION:** To provide decent housing, a suitable living environment and expanded economic opportunities, principally for persons of low-to-moderate income.
- Funds from different categories may be used for housing rehabilitation, wastewater treatment and collection systems, municipal water projects, storm sewers, flood control projects, other municipal and economic development projects (such as downtown rehabilitation).
- ELIGIBLE APPLICANTS:** Cities and townships with populations under 50,000 and counties with populations under 200,000.
- PROJECT ELIGIBILITY:** Proposed projects must meet one of three national objectives:
1. Benefit low-and-moderate income persons;
  2. Eliminate slum or blight conditions; or
  3. Eliminate an urgent threat to health or public safety.
- FINANCIAL ASSISTANCE:** Available funds are subdivided into three general categories:
1. Housing Grants
  2. Public Facility Grants
  3. Comprehensive Grants
- CURRENT FUNDING:** Approximately \$17,000,000 (1993)
- FUNDING SOURCE:** U.S. Department of Housing & Urban Development
- ASSISTANCE AMOUNT:** Maximum grant award for Housing and Public Facility projects is \$600,000. Maximum for Comprehensive projects is \$1.4 million.
- APPLICATION DATES:** Part One of the Community Development Application may be submitted at any time. Complete applications (including Part 2) must be received by September 1.
- CONTACT:** Department of Trade & Economic Development  
Community Development Division  
900 American Center Building  
150 East Kellogg Boulevard  
St. Paul, Minnesota 55101-1421  
(612)296-5005 (Metro area)  
1-800-657-3858 (Outstate)

## FINANCIAL ASSISTANCE PROGRAMS

WATER AND WASTE DISPOSAL LOANS AND GRANTS PROGRAM  
U.S. Department of Agriculture  
Farmers Home Administration (FmHA)

- PURPOSE/DESCRIPTION:** Funds are used for water, sewer, storm sewer and solid waste systems.
- ELIGIBLE APPLICANTS:** Public Entities (Cities, townships, counties or special districts)
- PROJECT ELIGIBILITY:** The project service area must be under 10,000 in population. Three different loan rates are available, and are tied to the median income of the community. Security is G.O. bond, repayment by special assessments and user fees on property taxes.
- FINANCIAL ASSISTANCE:** Combination of loans and grants. Loan terms are 30 years maximum. Grants are dependent upon Minnesota's allocation and the Median Household Income of the service area, and cannot exceed 50% of the project total.
- CURRENT FUNDING:**
- FUNDING SOURCE:** U.S. Department of Agriculture
- ASSISTANCE AMOUNT:** No cap amount on funds per project, but amounts are limited by community size.
- APPLICATION DATES:** On-going.
- CONTACT:** One of seven FmHA offices in:
- Grand Rapids (218)326-0561
  - Crookston (218)281-4815
  - Alexandria (612)762-8147
  - St. Cloud (612)255-9111

  - Marshall (507)532-9671
  - Austin (507)437-8247, and
  - St. Paul (State Office) (612)290-3842

## FINANCIAL ASSISTANCE PROGRAMS

STATE REVOLVING FUND PROGRAM  
Minnesota Pollution Control Agency/Public Facilities Authority

- PURPOSE/DESCRIPTION:** To provide low interest loans to municipalities which need to construct new wastewater facilities or to improve existing wastewater facilities.
- The program is jointly administered by the Minnesota Pollution Control Agency (MPCA) and the Public Facilities Authority (PFA). Loans are available for planning, design, and construction of either wastewater treatment or collection projects.
- ELIGIBLE APPLICANTS:** Any municipality on the MPCA Municipal Needs List.
- ELIGIBLE PROJECTS:** To be eligible for a construction loan the project must have a MPCA approved facilities plan. Proposed projects must address a wastewater collection, transportation, or treatment need; and be technically adequate, environmentally sound, and cost effective.
- FINANCIAL ASSISTANCE:** Loans are available at below market interest rates. A municipality has up to twenty years after project completion to pay back the loan. Most costs associated with an approved project are eligible for loan funding, including administrative and engineering costs.
- CURRENT FUNDING:**
- FUNDING SOURCE:** Federal and State capitalization funds plus repayments from previous loans.
- ASSISTANCE AMOUNT:** The PFA is responsible for determining the amounts, terms and conditions of the loan.
- APPLICATION DATES:** Varies; contact the MPCA for more information.
- CONTACT:** Minnesota Pollution Control Agency  
Water Quality Division  
520 Lafayette Rd.  
St. Paul, Minnesota 55155  
612/296-7162
- Public Facilities Authority  
Department of Trade and Economic Development  
150 East Kellogg Blvd.  
St. Paul, Minnesota 55101  
612/296-5005

## FINANCIAL ASSISTANCE PROGRAMS

INDIVIDUAL ON-SITE WASTEWATER TREATMENT SYSTEM GRANTS PROGRAM  
Minnesota Pollution Control Agency/Public Facilities Authority

- PURPOSE/DESCRIPTION:** To provide funding to local units of government for financial assistance to owners of individual on-site wastewater treatment systems for upgrading or replacing their failed systems.
- ELIGIBLE APPLICANTS:** Local units of government (municipalities)  
Both municipal and individual eligibility requirements must be met. Individual systems to be corrected must be within the official boundaries of the sponsoring municipality.
- PROJECT ELIGIBILITY:** Proposed municipal projects must address all failing on-site systems within their jurisdiction OR or receive an approval to designate an alternate planning area (a contiguous area that contains less than the entire jurisdiction of a municipality).  
  
Individual systems must be failed systems, have been constructed before January 1, 1977, must not serve a seasonal residence, must not have been constructed with state or federal water pollution control funds, and must be located within the approved project area.
- FINANCIAL ASSISTANCE:** Funds can be used to cover construction, site evaluation and design costs for individual and small cluster (up to 5 connections) systems.  
  
Projects requesting placement on the funding list will be ranked by the Median Household Income of the municipality.
- CURRENT FUNDING:** Unknown (Additional funding will be requested from the legislature in 1993.)
- FUNDING SOURCE:** Public Facilities Authority (state funding)
- ASSISTANCE AMOUNT:** Up to fifty percent (50%) of construction, site evaluation and design costs per individual establishment (such as homes, small business and public buildings). Cap amounts of \$2,500 for construction of a bed or trench system; \$3,750 for a mound system, and up to \$150 for both site evaluation and system design.
- APPLICATION DATES:** Notice of application periods opening will be published in the State Register. For direct notification, contact the Minnesota Pollution Control Agency.
- CONTACT:** Victoria Cook  
Minnesota Pollution Control Agency  
Water Quality Division  
520 Lafayette Road  
St. Paul, Minnesota 55155

**NORTH GEORGIA REGIONAL DEVELOPMENT CENTER**

CHEROKEE FANNIN GILMER MURRAY PICKENS WHITFIELD

**ASSESSING WASTEWATER NEEDS IN NORTH GEORGIA**

**Background**

The North Georgia Regional Development Center (NGRDC) serves a six county region located in extreme north-central Georgia. This rural area is a mountainous region. A large portion of the area is contained within the Chattahoochee National Forest, which is the headwaters region for many important rivers and streams that supply water to local governments not only in the six county region but also in adjacent regions in Georgia as well as adjoining states.

Although rural, the area is growing rapidly. Between 1980 and 1990, the population grew by just over 33 percent, from 174,000 to 232,000 people. During the same period, employment in the region grew from 58,000 to 87,000 jobs (a 50% increase). Although growing, the area's per capita and household incomes still fall below that of the State in five of the six counties.

The area contains 20 municipalities with the largest having 22,000 people and the smallest containing 62 persons. Of the 20 municipalities, 7 provide public wastewater collection and treatment services. These 7 communities contain a population of approximately 39,000 persons (17 %) of the total area population.

**Water Quality Concerns/Wastewater Needs**

There are several aspects to NGRDC's concern for addressing wastewater needs and maintaining clean water in the region. The first concern deals with the threat to surface water quality resulting from development activity. As mentioned, much of the North Georgia area is mountainous containing steep slopes and fragile soils. In addition, much of the land area is contained within small watersheds, which provide water supplies for the many public water systems in the area. Development on these steep sloped areas often leads to excessive erosion and sedimentation of the many streams. Other runoff occurs from development activity and likewise contributes to a degradation of water quality in area streams. Much of this problem could be addressed through better administration and enforcement of soil erosion and sediment control and watershed protection ordinances. However, the dilemma for most local governments is that they individually do not have adequate financial resources to hire and maintain qualified staff for this purpose. The challenge is to establish cooperative, multi-

jurisdictional administrative and enforcement arrangements. However, that also requires advanced planning and coordination, and again, there is little financial resources available to local governments for that purpose.

A second problem results in a threat to the area's ground water supplies. When septic tank construction disturbs the soil down to bedrock, bacteria can pass unfiltered into bedrock openings. Once in the bedrock, bacteria can travel hundreds of feet to a well or spring. Improper septic tank installation and maintenance can make this problem worse. In some cases, septic tank effluent rises to the surface and runs off to pollute surface streams. There have been many reported cases within the region whereby tests of springs, small streams and wells have indicated that levels of fecal coliform bacteria counts are 20 times higher than the levels allowed by the state for drinking water that is to be purified by chlorination only.

As mentioned above, most of the urbanizing areas of the region do not have access to public wastewater treatment. Much of the area contains soil types, which present moderate to severe limitations in the use of individual septic tank systems. Many of the problems mentioned can be dealt with through better administration and enforcement of requirements for minimum lot size determination and groundwater protection regulations. Generally, local governments are doing better jobs now than in the past in regards to these tasks, however, it is still often difficult for small, rural governments to find adequate financial resources for maintaining qualified staff for this purpose.

The problems associated with the reliance on individual septic tank systems are magnified among systems that were installed on lot sizes much smaller than those allowed today. There are instances of complete small subdivisions having septic tank affluent creating health risks and a reduction in the quality of life for the residents. The challenge to local governments is finding the resources to retro fit these areas with either public wastewater treatment systems or other alternatives that would correct the problem. Grant resources are limited and very difficult to obtain, and often, if loans are the only source, the benefactors can not afford repayment.

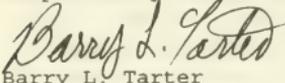

Finally, there is inadequate public wastewater collection and treatment systems capacity in the area to accommodate demand. Of the seven communities providing public wastewater treatment, three communities are either at, or rapidly approaching their capacity. Recently completed comprehensive plans in two counties indicate that there are three municipalities, which are not currently providing public wastewater treatment, but feel that due to growth and development pressures and resultant water quality problems, the need to install such systems is imminent. Of those communities having adequate wastewater treatment capacity, many are in need of installing collector trunk lines to accommodate development demands. In addition, all of the communities having old collection systems are faced with the fact that these systems are

deteriorating. As a result, there is significant infiltration of storm water, which further diminishes wastewater treatment capacity. In some cases, infiltration is so severe as to cause wastewater collection lines to overflow and spill sewage into drainage areas.

Planning is an important element to achieving success in addressing these problems. Although important, small, rural governments simply cannot assemble the resources to address all of their planning needs. The State of Georgia has recently taken the initiative to require local governments to prepare long range comprehensive plans to remain eligible for State grant programs. The State has also provided some grant resources to each Regional Development Center to be used to provide assistance to local governments in meeting the planning requirement. Generally, this initiative has proven to be successful. Infrastructure needs are being identified and long range strategies are being prepared. However, plans call for implementation. If State and Federal resources are not available to assist these communities in addressing needs, little will actually be accomplished.

The bottom line is that there is a considerable need to address wastewater and water quality needs in the six county North Georgia area. The needs range from assistance for planning and technical expertise in managing development activities to assistance with planning, design and construction of collection and treatment infrastructure. Small, rural governments have very limited resources, and because they have a small tax base, they are limited in their ability to raise tax revenues. Generally lower per capita and household incomes likewise limits their abilities to finance these infrastructure needs through user fees. Over the last several years, grant resources available through such programs as the Appalachian Regional Commission, Farmers Home Administration, Economic Development Administration, and Clean Water Act have been diminished to the point whereby the amounts available are too small to fill the financing gap that exists. Individual grants are too small or match requirements are too high to enable small, rural governments to fully address their wastewater needs. The result is that nothing gets done. Needed investments in rural wastewater infrastructure are not being made simply because neither the local communities or state and federal governments have adequate financial resources available for this purpose.

Respectfully Submitted,

Barry L. Tarter  
Executive Director, NGRDC

Committee on Public Works and Transportation  
B-370A Rayburn House Office Building  
Washington, DC 20515

Dear Mr. Chairman:

It is my understanding that the Water Resources and Environment Subcommittee recently held hearings on the hardships faced by small communities in complying with the Clean Water Act. I would like to share a specific example with you for the Committee's consideration.

Numerous publicly owned treatment works (POTW) and private corporations are in the process of renewing wastewater discharge permits. Many of these permits contain effluent limits that will force localities to make major capital investments in new wastewater treatment facilities.

The Henry County Public Service Authority (PSA), a POTW with approximately 15,000 customers, has been informed by the Virginia State Water Control Board that they can expect to receive a discharge permit with a copper effluent limit of .011 mg/L. An environmental engineering firm has advised the PSA that reverse osmosis will have to be utilized in order to achieve this limit, requiring an initial capital investment of \$30 million for both its treatment plants. While the State Water Control Board maintains that this permit was developed in strict accordance with EPA Guidelines, the PSA feels that the limits are unreasonable and that they do not take into account the actual assimilative capacity of the receiving waters.

According to its Executive Director, the PSA will have to triple the rates that they charge their customers if they are required to spend this amount on a new treatment facility. He fears that the increased rates for industrial users will force the closure or relocation of one of the area's largest textile mills and the PSA's largest customer. He is also concerned that the threat of these rate increases may curtail further capital investment by the textile industry in the county.

THIS STATIONERY PRINTED ON PAPER MADE OF RECYCLED FIBER

Honorable Douglas Applegate -- Page 2

Additionally, the Executive Director believes that the PSA will have to abandon its current plans to expand their service area, thereby denying water and sewage treatment to Henry County residents waiting for service, many of whom currently have substandard wells and septic tanks.

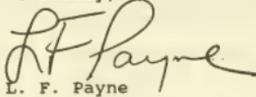

Small communities have a limited customer base, and this severely restricts their ability to spread the cost of capital investments over a large number of users. Revolving loan programs are of limited assistance, since the number of users is too small to absorb the capital cost of the project, regardless of the repayment mechanism and interest rate charged. The practical effect of the regulations is to leave many residents of rural communities unserved by a public water supply.

While protecting the environment should be one of our nation's top priorities, I am concerned that environmental cleanup in this and similar cases might be occurring at the expense of the public's health. I urge the Committee to consider ways to reduce the financial burdens being forced upon localities by these environmental regulations.

Thank you for providing me with the opportunity to comment on this important matter.

With kindest regards, I remain

Sincerely,

L. F. Payne

February 23, 1993

The Honorable Douglas Applegate  
United States Representative  
2183 Rayburn House Office Building  
Washington, DC 20515-3518

Dear Mr. Applegate:

I am submitting this written testimony on behalf of the South Dakota Department of Environment and Natural Resources for the hearings on sewage treatment needs of rural counties and small towns. I request that it be included in the record.

Over 80% of South Dakota's communities have populations under 1,000. We have struggled to develop a program that will meet the needs of all communities and sanitary districts. I hope that this testimony will provide some insights into the difficulties and road blocks facing rural communities.

I appreciate your consideration of this testimony.

Sincerely,

A handwritten signature in dark ink, appearing to read "Robert E. Roberts".

TESTIMONY OF

ROBERT E. ROBERTS

SECRETARY

SOUTH DAKOTA DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

ON RURAL SEWAGE TREATMENT NEEDS

SUBMITTED TO THE

WATER RESOURCES AND ENVIRONMENT SUBCOMMITTEE

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

UNITED STATES HOUSE OF REPRESENTATIVES

FEBRUARY 25, 1993

I am Robert E. Roberts, Secretary, of the South Dakota Department of Environment and Natural Resources. I am submitting this written testimony in an effort to document the wastewater treatment needs of South Dakota's small towns and rural communities, to appeal for your help to extend the SRF program until the year 2000, and to request your assistance in the development of a program for communities with populations under 1,000 people.

South Dakota is a rural state with a population slightly less than 700,000. Of the 310 municipalities in the State, only two, Sioux Falls and Rapid City, have populations greater than 25,000 persons. Only 10 municipalities have populations greater than 10,000. Over 250 communities, or 82% of all the organized municipalities in the State, have populations less than 1,000 people.

As you can see, South Dakota is virtually all rural. This rural nature means significant differences between wastewater treatment needs of cities and that of rural communities. The major differences are in the method of treatment and the costs associated with that treatment. Rural communities most often face a much greater financial burden per capita to satisfy their wastewater treatment needs. Construction costs, mobilization costs, and operation costs are usually much higher on a per capita basis.

Many of the communities in the State are located on shallow aquifers or near a surficial source of water which supply their domestic water. According to the 1991 South Dakota Public Water

Supply Vulnerability Study, 35% of the communities assessed have a public water supply which is vulnerable to contamination based on the local geology. It is vital that these communities have sound wastewater treatment systems to protect their source of drinking water.

South Dakota has invested in excess of \$12 million annually since 1978 in wastewater treatment through the EPA Construction Grants and EPA State Revolving Fund (SRF) Loan programs. The demand for funds is not decreasing nor do we expect it to diminish at anytime in the near future.

Let me also note for the record that the 1992 EPA Needs Survey of wastewater needs in South Dakota documented \$104,768,000 of wastewater needs over the next 20 years, and this represents only the documented need. Our experience in the Department of Environment and Natural Resources has been that the needs of the State's rural communities are significantly higher than reflected on the Needs Survey. We know that very few rural communities have the capabilities to project their long-range infrastructure needs. A perfect example of this occurrence is the town of Harrisburg with a population of 727 people. In July of 1992 Harrisburg responded to the EPA Needs Survey indicating no projected needs (letter attached). Less than 9 months later, Harrisburg has submitted a \$700,000 State Revolving Fund loan application for wastewater treatment efforts.

While there are communities that don't know their needs, there are still others that hesitate to make their wastewater needs known for fear of enforcement actions or the seemingly hopelessness of financing the needed improvements. Generally, only those small communities having a need which they intend to address in the immediate future show up on the Needs Survey.

South Dakota has been a leader in the nation with its State Revolving Fund loan program. Not only was South Dakota one of the first states to provide SRF loan monies for the construction of a wastewater project, but it was also the first state to issue bonds for the state match required for this program. In the four years the program has been operating, 42 loans have been issued totalling \$36.4 million.

Despite the successful implementation and widespread use of the SRF program, shortcomings exist. First and foremost is the amount of money that will be available through the program once it is fully capitalized. As I indicated earlier, South Dakota anticipates needs of \$12 million annually but will have only \$4 million available if funding is not extended beyond 1994. Soon the multi-million dollar mechanical wastewater treatment facilities which were constructed in the mid-1970's and early 1980's will reach their 20-year design life. The cost for a major rehabilitation of just one such facility will exceed the annual \$4 million of SRF monies available, leaving other worthy projects unfunded.

South Dakota has not been able to commit significant funding to communities under 1,000 because of the use of bonds to generate the State match. The structure of the State's bonds has required that 75% of the borrowers be investment grade. Communities with populations under 1,000 are difficult, if not impossible, to rate as investment grade. Additionally, the cash flow requirements to meet the debt service on the bonds precludes the State from providing 0% interest loans for small communities. As a result, the SRF program is often inaccessible to the very small, rural communities. St. Lawrence, a small community in central South Dakota, is a good example. They face upgrade expenses of \$200,000 with a population of 223 people. Despite the fact that no community in South Dakota has ever defaulted on a bond issue of any nature, this is not a loan which our bond holders are rushing to embrace. This is a "no win" situation. South Dakota must protect the integrity of the SRF program in perpetuity, yet South Dakota must assist St. Lawrence in complying with the Clean Water Act.

Currently, those communities unable to access the SRF program must look to other sources of funding for wastewater projects. The most likely sources are the Community Development Block Grant (CDBG) program, Farmer's Home Administration loans, and state loans and grants. These programs do not fund solely wastewater projects, so there is competition for these funds from other areas. These programs can supplement the SRF program but are still not able to fully address the wastewater needs throughout the State.

South Dakota supports the SRF program and we encourage your continued and increased support. We also encourage your support of a funding source to be used specifically by those communities which cannot address their wastewater needs through the SRF program.

In summary, the state of South Dakota and EPA have documented wastewater infrastructure needs over the next 20 years which exceed the capabilities of available funding sources. Coupled with the undocumented wastewater needs, South Dakota rural communities need additional funding sources to supply their citizens with proper wastewater facilities and ensure the integrity of its natural resources. We respectfully request this committee continue funding of the SRF program through the year 2000. Additionally we request that this committee develop a funding program for those communities who are unable to access the SRF program. I hope that this testimony proves useful for the Committee.

July 22, 1992

Department of Environment & Natural Resources  
 Joe Foss Building  
 523 East Capitol  
 Pierre, South Dakota 57501-3181

Subject: Wastewater 1992 Needs Survey

The City of Harrisburg does not have a five-year plan or engineering document addressing our needs for expansion of Wastewater Needs. However, listed below is our expected needs within this area within the next twenty years, and at this time do not have any projected costs or when the project might be completed.

Projected needs are; Monitoring devices, Lift Station and gravity flow sewers, additional Ponds or wet lands, sewer cleaner, and sewer expansion in all directions of Harrisburg.

Some of the needs listed above are subject to the growth of Harrisburg.

Sincerely,

*Rosan Larson*

WRITTEN STATEMENT OF  
JOHN SANDOR, COMMISSIONER  
ALASKA DEPARTMENT OF ENVIRONMENTAL CONSERVATION  
on behalf of  
THE STATE OF ALASKA

SUBMITTED TO  
THE HOUSE PUBLIC WORKS AND TRANSPORTATION  
WATER RESOURCES AND ENVIRONMENTAL SUBCOMMITTEE

**Overview:**

The Clean Water Act has greatly assisted municipalities across the nation in meeting their wastewater treatment needs. However, with the exception of a small, underfunded set-aside grant program, the Act has ignored the sanitation needs of America's rural and indigenous Native population.

Rural Native villages account for nearly three quarters of Alaska's communities. The wastewater facilities in over 190 of these 220 villages have been assessed by the federal government as inadequate. In over half of these communities, five gallon buckets and pit privies are the sole means of sewage disposal and collection. Raw sewage lies in open pits and bunkers throughout residential sites. During seasonal flooding sewage is spread with contaminated water throughout communities. Plastic bags full of human waste accumulate in heaps on the shores of river banks and tundra ponds. Waterborne disease runs rampant.

The Environmental Protection Agency has estimated that it would cost approximately \$468 million to address the wastewater needs in Alaska villages. If drinking water needs were added, this estimate would more than double. Yet, since 1972 less than \$20 million has been made available through the Clean Water Act to help improve these critical conditions. By stark contrast, over \$60 billion has been spent through Clean Water Act programs for piped secondary treatment facilities across the nation. This discrepancy is difficult to understand. The remoteness of Alaska's rural villages may be the reason for this lack of federal awareness in the past. However, it can no longer be an excuse. The residents in rural Alaska deserve a safe drinking water supply in their homes and a sanitary means of sewage disposal just as much as any other American. Yet, while the vast majority of Americans take flush toilets for granted, residents in rural Alaska continue to contend with waterborne disease outbreaks due to third world sanitation conditions.

Alaska is committed to solving these problems and has developed a long-term comprehensive strategy for improving these conditions. It is an ambitious but realistic strategy. The State plans to commit \$25 million per year for system construction; \$1.5 million for planning, design, and management/administration; and \$1.5 million for operator and utility management training. However, in order for the plan to work, an increased federal commitment is necessary. Due to the magnitude of this problem, a State/Federal partnership is essential. The Clean Water Act is the logical vehicle for solidifying this cooperative effort.

Including the following items in the Reauthorization of the Clean Water Act would cement such a partnership: increased funding for Alaska villages under the Indian Set-Aside program; earmarking resources to expand the State's existing operator training and circuit rider programs to provide over-the-shoulder training and assistance for operators and utility managers; including drinking water projects under the Indian Set-Aside program; a State/Federal matching grant program for Alaska village sanitation projects; and increased flexibility within Clean Water Act programs so that they are adaptable to rural Alaska.

### Sanitation Conditions in Rural Alaska

It is doubtful that many Americans understand the dire sanitation conditions which the residents of rural Alaska villages are consigned to on a daily basis. These conditions are not only inferior to those found in the rest of America, they are, in many cases, on a par with third world countries.

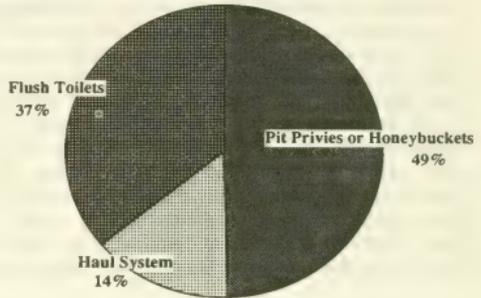

In 135 villages, honeybuckets and pit privies are the sole means of sewage collection and disposal. A honeybucket is the commonly used name for a 5 gallon bucket which is placed in a discrete area of the home and used as a toilet. Sometimes these buckets are lined with plastic trash can bags - often they are not. If a liner is used, when the bucket is filled, the bag is tied off and taken out of the home for disposal. If a liner is not used, the honeybucket itself is simply carried out of the home, its contents dumped, and it is then returned to be used as a toilet again.

In approximately 30 villages, community haul receptacles are available. In these communities, residents carry their honeybuckets to a centrally located receptacle and dump the bucket's contents into the receptacle. When the receptacle fills up, it is hooked to a trailer and carried off to an area outside of the community for final disposal. Due to uneven terrain, spillage from receptacles is frequent during hauling.

37% of Alaska's villages are reported as having flush toilets. This statistic is misleading. In many of these communities over a quarter of the households within the village are not hooked up to the system. Funding simply was not available to extend the system to all residents.

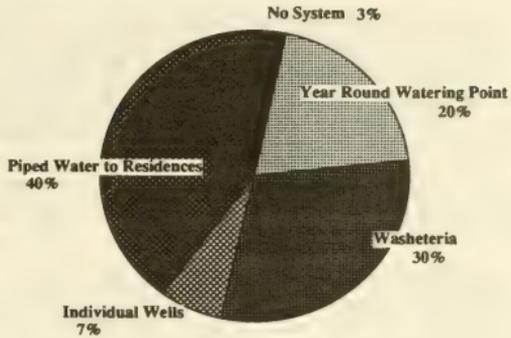

Raw sewage pitched from honeybuckets and uncovered sewage pits and bunkers filled with human waste pose an immediate threat to the health of village residents. Honeybucket wastes and honeybucket bags are dumped into ponds, creeks, rivers, or on the ground directly outside of homes. Unlined sewage pits allow liquid wastes to leach into the groundwater in villages where shallow wells provide the community's drinking water. Children play in close proximity to wastes and can easily trip and fall into sewage pits scattered throughout village sites. When spring flooding occurs, sewage from the pits is spread with contaminated water throughout residential areas.

EXISTING WASTEWATER SERVICE LEVELS IN RURAL ALASKA

Water systems in rural Alaska vary greatly in complexity and service level. In well over half of the 220 villages in the State, water must be hand hauled by residents from washeterias, watering points or from creeks or rivers. Thirty percent of the villages in rural Alaska have a washeteria. A washeteria is a centrally located building within the community where coin operated washing and drying machines are available for residents. In many, showers are also provided at a cost to the customer. Water for hauling to the home is available.

EXISTING WATER SERVICE LEVELS  
IN RURAL ALASKA

Watering points may vary from several spigots located throughout the village to a single building from which potable water is dispensed by a hose and hauled in buckets by residents to their homes.

A single trash can is typically used to store water for drinking, handwashing, and all other household needs. Water containers are frequently left uncovered and water may become contaminated when water is dipped for use. For instance, people may dip water for handwashing immediately after hauling honeybuckets. Once a water container is contaminated, it remains contaminated and disease results.

The following statistics further highlight the magnitude of the sanitation problems in rural Alaska:

- Ninety-two percent of the sewerage systems in Alaska villages have been assessed by the federal government as inadequate;
- According to a 1990 Report to Congress on "Indian Wastewater Needs" written by the Environmental Protection Agency, Alaska not only has the highest concentration of Native sewage treatment needs in the nation, it accounts for seventy-four percent of the nation's Native wastewater needs;
- State and federal agencies have estimated that \$1.2 to \$1.3 billion is needed to address the water and sewer problems in rural Alaska.

### **Why the Construction Grants and State Revolving Fund programs have not helped Native Villages in Rural Alaska:**

To date the Clean Water Act has provided two major programs for financing publicly owned wastewater treatment facilities - the Construction Grants Program and the State Revolving fund program. The design of these programs has resulted in an enormous inequity. The Construction Grants program was developed with an eye toward large scale projects in highly populated municipalities and the State Revolving Fund program is designed for cities with the population and economic base to repay a loan. Because they lack a sizable population with a healthy income and a large local government infrastructure, the pressing sanitation needs of small, poorer communities such as Alaska Native villages have been neglected by the Clean Water Act.

A multitude of requirements and regulations made it impossible for villages to take part in the Construction Grant program. Applicants had to sign an assurance certification that they had the legal, institutional, and managerial capability to ensure adequate construction, operation and maintenance of a Construction project. The administrative paperwork alone on a Construction Grant project in Alaska's handful of larger communities has never been less than five file folders which were five inches thick each. Without this minimum of a 25 inch paper trail, the project would fail an EPA audit. In most villages, local government staffing consists of a clerk, a part-time mayor, a council, a health aid, and a village police officer. There is no public works department. The administrative, managerial and institutional levels required to undertake a project under this program simply were not available in rural Alaska villages. Nor did the requirements of this program lend themselves to a non-piped system in a small village.

In 1987, Congress decided to phase out the Construction Grants program and phase in the State Revolving Fund (SRF) programs. SRFs are loan specific and designed for communities with the economic and population base to repay a loan. Alaska rural villages do not have this capability. Most villages have a population of 350 or less. Unemployment is high. Nearly sixty percent of the rural village workforce is classified as "discouraged" meaning they have given up on seeking employment. Which is understandable - there are few cash jobs in these communities because there are typically no employers. The few jobs that are available are typically seasonal in nature - such as fishing and fire fighting. According to the 1990 census, the median household income in 82 of Alaska's 220 Native villages is less than one-half of the national average median household income of \$35,225. In several villages, median household income is less than \$10,000. To further compound the problem, the cost of living in rural Alaska is extreme since there are no roads and all consumer goods must be flown or barged into the community. Almost all village residents depend in part on subsistence hunting and fishing.

Alaska Native villages do not have the financial capability to repay a loan no matter how low the interest rate or how long the amortization period.

### **The Indian Set-Aside program In Rural Alaska:**

For the last five years, EPA has administered a single program which has assisted in improving sanitation conditions in Alaska Native Villages and Indian reservations - the Indian Set-Aside program. Unfortunately, the program is severely underfunded. Only one-half of one percent of all funds appropriated to the State Revolving Loan program were set-aside for this program. In other words, for every \$1 million in funding for SRFs, \$500 was set-aside for urgently needed projects on reservations and in villages.

Throughout the Set-Aside programs six year history, a little over \$46 million was made available for Alaska Native Village and Indian Tribe projects. Competition for grants was so steep that the Environmental Protection Agency quit accepting priority list applications after the program's second funding cycle. In the two short periods during which the agency accepted applications, it received over 194 requests from Alaska Native Villages and Indian Tribes across the nation. Less than twenty percent of the projects on the aged priority list were funded.

Although extremely competitive and severely underfunded, the Indian Set-Aside program has been a success in rural Alaska. When developing the program, staff from EPA took the time to learn how the Indian Health Service (IHS) and the Alaska Department of Environmental Conservation (ADEC) administer sanitation programs in rural Alaska. Over the course of a year, they worked with ADEC staff to find the best methods for implementing the new program in Alaska. They made on-site visits to villages to learn how ADEC and IHS work with rural communities. They worked with ADEC staff to develop a set of procedures adaptable to rural Alaska. As a result, they designed a program which has been proven to work in Alaska Native Villages.

Once grants were awarded through the Environmental Protection Agency, project management and administrative assistance was offered through ADEC or the IHS. Village residents were hired to do actual construction work thereby helping the local economy and nurturing a pride of ownership in the project by residents.

Although it was effective in helping several villages, the set-aside program barely scratched the surface of the sanitation improvements needed in rural Alaska. Since the program originated in 1987, approximately \$18.3 million has been granted to Alaska Native Villages. That averages out to a little over \$3 million per year. In a 1990 Report to Congress, EPA estimated that wastewater needs in Alaska Native Villages totalled \$468 million. Therefore, if the program was to be continued at the same annual funding rates and Alaska Villages continued to compete as well for funding as they had in the past, it would take over one hundred and fifty years for the Set-aside program to address the wastewater needs of Alaska Native Villages.

### The Alaska Rural Sanitation Strategy:

As the nation faces the twenty-first century, the basic sanitation needs in rural Alaska have yet to be addressed. This situation is breeding a health, safety, and environmental crisis in Alaska Native Villages. Waterborne diseases such as Meningitis and Hepatitis A occur at an alarming rate. Hepatitis A is considered endemic in many villages and has been a contributing factor in two deaths this year. Dysentery is so common it is rarely reported. Because the population in these rural communities is projected to double in the next twenty years, the need to bring about improvements to existing sanitation conditions is even more urgent.

With this in mind, the Alaska Sanitation Task Force was formed a year ago. This forty-five member team, with broad public and private sector representation, worked for over six months developing a long term comprehensive plan for tackling this severe problem. Thanks to the time and efforts of these professionals, Alaska now has a Rural Sanitation Strategy.

There are seven underlying principals to the Alaska Rural Sanitation Strategy developed by the task force. These are:

- There are no quick fix solutions. This is a 10-20 year strategy.
- A coordinated, comprehensive, multi-disciplinary approach is essential.
- Technology and capital funding alone will not address the problem. Competent operators, adequate user fees, environmental health education and the support of a well managed community government are equally vital.
- Facilities must meet the unique demographic, economic, and climatic conditions of each village. Alternatives to complex and expensive piped systems will be necessary in many areas.
- Addressing the sanitation problems in rural Alaska will require a joint federal, State, and local partnership with an increased commitment by all involved.
- A single influx of a large sum of federal or State capital funding could be counter productive. Increased funding levels are needed but should be made at reasonable rates and only to communities that will be able to manage completed facilities.
- Community planning, operator and utility management training and assistance must keep pace with capital expenditures.

### **A Federal/State partnership is essential.**

The State of Alaska is committed to implementing the Rural Sanitation Strategy. However, due to the magnitude of the problem, we can not do it alone. A Federal/State partnership is essential. The Clean Water Act is the logical vehicle for solidifying this partnership.

Including the following items in the Reauthorization of the Clean Water Act would allow the Environmental Protection Agency to become a full partner with the State of Alaska in improving the sanitation conditions in rural Alaska:

- **Increase Funding for the Indian Set-Aside program or establish a separate State/federal matching grant program.**

Although severely underfunded, the Indian Set-Aside program has provided some truly needy areas with sewage facilities. Grant funds awarded under the set-aside have provided a small but significant step towards meeting the sanitation needs of Alaska Native Villages. But much remains to be done and far more funding is needed. Funding should continue to be awarded based on health and environmental criteria. Political and regional equity considerations should not override priority needs in determining grant distribution. The programs goal should remain to address the nation's Native populations most pressing sanitation needs regardless of regional location.

Alternatively, a separate State/federal matching grant program could be established within the Clean Water Act specifically for implementing a State/federal rural Alaska sanitation strategy.

- **Project eligibility should be expanded to include water projects.**

Many rural Alaska villages lack adequate water storage in residential housing to support a wastewater facility. Additionally, it is much less expensive to plan, design and construct water and sewer projects at the same time - especially in remote areas of Alaska. Including water projects as grant eligible would expand the wastewater alternatives which could be considered for set-aside projects and would save money.

- **Earmark resources to expand the State's operator training and circuit rider programs to provide over-the-shoulder training and assistance for operators and utility managers.**

Without trained operators and utility managers, sanitation systems would be placed in jeopardy. It is essential that any funds allocated for capital construction costs carry a minimum set-aside of 4% for utility operation and management training and assistance. The State has programs in place to address these needs, but they need to be expanded.

Although village water and sewer systems are typically smaller and less complex than those found in larger communities, skilled operators and utility managers are just as important to their continued success.

- **Provide increased flexibility with Clean Water Act programs so that they are adaptable to rural Alaska.**

During the last twenty years over \$60 billion has been made available through the Clean Water Act to assist municipalities across the nation meet their wastewater treatment needs. By contrast, less than \$20 million has been allocated for improving the sanitation needs in rural Alaska. For the most part, this was because traditional Clean Water Act programs were not designed with rural Alaska villages in mind. They lacked the flexibility to meet the unique demographic, economic, and climatic conditions of Alaska's 220 Native villages. Examples of areas where increased flexibility would assist the State include: (1) Allowing the States to determine whether to use part of its capitalization grants as Indian Set-Aside grants to fund water and sewer projects; (2) Ensuring that any national operator and utility management training effort is delegated to the State for implementation. The training needs in Alaska are too unique for "canned" training. The State has training programs in place that have been tailored to meet Alaska needs - additional funding for these programs is greatly needed, however.

The State of Alaska is prepared to enter into a long-term partnership arrangement with Federal agencies to deal with the serious water and sanitation problems in Alaska's Native villages. With this partnership effort, substantial progress can be achieved in developing and operating these facilities in arctic and subarctic conditions.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, MARCH 31, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER  
RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC  
WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to recess, at 9:38 a.m. in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLEGATE. The Subcommittee on Water Resources and Environment continues its hearings on issues relating to the reauthorization of the Clean Water Act.

In February, we received testimony concerning sewage treatment needs and the associated funding needs of rural and small communities. It was clear from that testimony that the small and rural communities have and will continue to have needs which are not being adequately addressed by existing programs. The per capita resources of small and rural communities are often inadequate to meet the higher per capita costs which often accompany sewage treatment projects in such communities.

I'm confident that Federal financial assistance programs can be altered to accommodate these pressing needs. Beginning today, we will receive testimony for seven days on additional issues concerning the reauthorization of the Clean Water Act. Today and tomorrow, we will receive testimony on issues of concern to State and local governments involved in the implementation of the Clean Water Act. We will continue to hear about unmet financial needs as well as the burdens and responsibilities placed on State and local governments to achieve the water quality required by the Clean Water Act.

Our hearings will resume following the Easter district work period at which time we will hear from various representatives of industry, real estate development, agriculture, environmental advocates, academia and members of Congress. Finally, we will conclude our hearings on May 5 with testimony from EPA Administrator Carol Browner on the Clean Water Act reauthorization generally and also from a representative of the Department of the Army on wetlands protection and the Tennessee Valley Authority on a watershed approach to achieving clean water.

I look forward to the participation of all of our subcommittee members in this very, very complex and important process.

Before we start out with our witnesses, I want to recognize my very distinguished colleague, the ranking Republican member of the subcommittee, Mr. Boehlert of New York.

Mr. BOEHLERT. Thank you very much, Mr. Chairman.

I want to welcome all of you here to the first in a series of comprehensive hearings our subcommittee will be having on the reauthorization of the Clean Water Act. These hearings will set the tone and structure for debate on what I believe to be one of the most important pieces of legislation to be considered by this committee and indeed, this Congress.

The quality of our Nation's waters and the competitiveness of America's industry will be directly linked to our efforts in reauthorizing the Clean Water Act. We must learn from our competitors in the global marketplace, investment in water infrastructure creates jobs in the short time and improves competitiveness in the long-term.

Since 1972, America has made great strides towards the goal of swimmable and fishable waters. During the last two decades, we have invested over \$60 billion in the construction of wastewater treatment facilities. However, the time has come to adjust our clean water policies to the realities of the 1990s. EPA estimates that pollutants from nonpoint sources now constitute over 50 percent of our water quality problems. Data also indicate that the majority of new wastewater treatment construction projects are needed in small, rural communities. Our policies should reflect these facts.

We must pursue a more holistic approach to water quality management and regulation. As the New York City Watershed has shown us, we all live downstream. The wastewater treatment and land use policies of 10,000 people who reside in the district I am privileged to represent are critical to the drinking water needs for 10 million people living in New York City.

The challenges before us are somewhat daunting. The most recent EPA needs survey places the cost of America's near-term wastewater treatment needs in the neighborhood of \$80 billion. The issue of wetlands, combined sewer overflows and nonpoint source pollution have no quick or simple solutions.

To meet these challenges in fiscally austere times, innovative methods of clean water protection, regulation and financing must be pursued. Today's witnesses should shed important light on the direction America's clean water policies need to take.

I look forward to these hearings, Mr. Chairman.

Thank you.

Mr. APPELATE. Thank you very much, Mr. Boehlert.

We're very honored, of course, as always to have the very distinguished Republican ranking member of the full committee, Mr. Bud Shuster of Pennsylvania.

Mr. SHUSTER. Thank you very much, Mr. Chairman.

I believe that these hearings are the beginning of what could well be the most important legislation that this committee writes in this Congress. So I'm looking forward to all working together on this very important legislation.

Our goal is not to completely rewrite and overhaul the Clean Water Act, but rather to improve the various aspects of it and face

the challenges that are confronting this Nation's environmental infrastructure.

Finally, I believe our goal should be and indeed is, to not only create a cleaner environment but also a stronger economy. I think it's enormously important that we're sensitive to the economic implications of the environmental decisions that we make so that we achieve not only cleaner water but more jobs for Americans in the process.

Thank you very much.

Mr. APPLEGATE. Thank you very much, Mr. Shuster.

I have received prepared statements from our colleagues, Ms. Norton of the District of Columbia, and Mr. Zeliff of New Hampshire. These statements will be placed in the record at this point.

[Statements referred to follow:]

STATEMENT OF HON. ELEANOR HOLMES NORTON

Mr. Chairman, I am pleased to join my colleagues today to consider the reauthorization of the Federal Water Pollution Control Act. Today marks the continuation of hearings on one of the most important environmental issues which will come before the 103d Congress.

It is with pleasure that I welcome witnesses from the National Governors Association, Water Quality 2000, Coastal States Organization, and others who are interested in sharing their views in order to promote national policies and goals for the 21st century that will protect and enhance the water quality of our nation.

I am looking forward to hearing from today's witnesses and I welcome them all.

STATEMENT OF HON. WILLIAM H. ZELIFF, JR.

Mr. Chairman, I want to thank you for calling this hearing today as we continue the reauthorization process of the Clean Water Act.

The reauthorization of the Clean Water Act Probably represents the most important piece of legislation that this subcommittee, and the full committee, will consider during the 103d Congress.

The problems and challenges associated with the Clean Water Act have extremely important environmental consequences, and the manner in which we address these challenges will impact this country for years to come. But the Clean Water Act has a very real economic dimension as well, and I am eager to hear the testimony today from the State and local perspective on this pressing issue.

Since 1972 the Federal Government has provided over \$60 billion in grants to municipalities for sewage treatment, and this, coupled with the permit requirements and regulations provided in the Act, has generally succeeded in improving the water quality of our rivers, lakes, and streams.

However, we continue to hear estimates that as much as \$100 billion or more over the next several years will be needed to meet the sewage treatment needs of communities around the country.

We also have other challenges to address, such as the expensive problem of combined sewer overflows, a major problem in one of the cities in my district, Manchester, NH. Other obstacles to overcome include the problem of nonpoint source pollution, as well as the controversy surrounding the issue of wetlands protection.

Mr. Chairman, I am eager and willing to work with you and the other members of this subcommittee to solve these and many of the other problems surrounding the debate over clean water, and I look forward to hearing what will no doubt be very valuable testimony presented today.

Thank you, Mr. Chairman.

Mr. APPLEGATE. We will call to the witness table the four witnesses and have them come to the table as a panel, which would include: first, the National Governors' Association, the Association of State and Interstate Water Pollution Control Administrators; Council of Infrastructure Financing Authorities, and Coastal States

Organization. We will have one additional panel after this which will be the Water Quality 2000. We will hear from them later.

I believe we will begin with Mr. Hemmer.

**TESTIMONY OF DENNIS HEMMER, COMMITTEE ON NATURAL RESOURCES, NATIONAL GOVERNORS' ASSOCIATION; ROBERTA SAVAGE, EXECUTIVE DIRECTOR, ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS; TERRY AGRISS, PRESIDENT, NEW YORK STATE'S ENVIRONMENTAL FACILITIES CORPORATION, AND PRESIDENT, COUNCIL OF INFRASTRUCTURE FINANCING AUTHORITIES; AND DAVID C. SLADE, DIRECTOR, COASTAL STATES ORGANIZATION**

Mr. HEMMER. Good morning, Chairman Applegate and members of the subcommittee.

I am Dennis Hemmer, Director of the Wyoming Department of Environmental Quality. I'm here today on behalf of both the National Governors' Association and the State of Wyoming.

The National Governors' Association has adopted extensive policy on the Clean Water Act. In light of the limited time, I will discuss only the priority recommendations concerning State revolving funds, non-point source pollution control, stormwater and wetlands protection. However, I have attached a copy of the complete NGA Water Resources Policy to my testimony and request that it be included in the hearing record.

The challenge that you have before you in reauthorizing the Clean Water Act is to craft a law that addresses the problems of the Nation while allowing the flexibility for each State to address its specific concerns. Before I discuss the Governors' recommendations, I want to make a general plea for attention to State resource constraints and allowance for flexibility to use our limited resources in the most cost effective manner.

I represent the least populous State in the Nation. While we share many of the problems of other States, we have also been spared many of their problems. Today, Wyoming, like most States—and indeed, this Nation—is struggling to find the resources to support essential programs. As you've no doubt heard repeatedly, we do not need more unfunded mandates.

We do need to focus on areas that pose the greatest risk to the public health and environment. Allow States to target priority concerns and don't require States to expend resources where they are not needed.

I'll start with the State revolving fund. The Governors' recommendation concerning funding is perhaps the most important element of the NGA position. Continued progress toward meeting the goals of the Clean Water Act depends on adequate funding for the water programs. The current funding levels are clearly inadequate in face of the projected needs.

The Governors adopted a policy in February recommending increased funding to \$5 billion per year through the year 2000 in Federal capitalization grants to the State revolving loan funds. The Governors have recently communicated to the President and the Appropriations Committee that in no case should appropriations fall under \$2 billion for wastewater and \$1 billion for drinking

water. I have attached a copy of the NGA letter as ask that you include it in the hearing record.

Note that \$5 billion per year was the sum originally authorized and appropriated for wastewater treatment infrastructure under the Clean Water Act of 1972 prior to the introduction of costly new mandates imposed on States by the 1987 Clean Water Act amendments.

Considering the effects of inflation, the annual Federal commitment has been reduced by more than half over the last 20 years. At the same time, the program is much more expensive than it was 20 years ago. The Governors support continued use of the State revolving loan funds as a primary source of wastewater infrastructure financing. NGA opposes financing through direct Federal construction grants.

The SRF Program is an excellent example of efficient government investment. SRF provides sustainable, long-term funding and has a rapid payout rate. Through bonding, you can leverage the money even further.

While recommending the SRF as the primary source of wastewater infrastructure, the Governors recognize the special problems of small communities and that the low interest loans currently available through the SRFs do not provide adequate assistance to some small communities. However, the Governors believe that small communities should be addressed through special allowances in the SRF program rather than through a separate grant program.

NGS recommends four provisions to facilitate small community participation in the SRF Program: special assistance through principal subsidy programs in which States use SRF interest earnings to subsidize small community projects; 40-year loan repayment periods; inclusion of expenses associated with the purchase of land, easements and right-of-ways as eligible expenses; allowance for the use of SRF administration funds for technical assistance to small communities.

I've read recently of the debates over whether the State revolving loans or funds for safe drinking water should be included in the current SRF or established as a separate fund. While the Governors have not taken a position on this issue, on behalf of the State of Wyoming, I urge you to combine the two. While I recognize the difficulty of combining funds addressing two separate acts, each State needs the flexibility to address its own specific problems. In Wyoming, we have addressed our wastewater needs for the future. However, we have drinking water needs projected to cost as much as \$250 million.

I urge you to overcome jurisdictional difficulties and to ignore protectionists cries from individual programs and take a comprehensive approach that delivers the most needed services to our citizens.

Reducing nonpoint source pollution control demands, in essence, a societal change. Nonpoint source pollution is cumulative and difficult to quantify. A successful nonpoint source program is a pollution prevention program that must involve convincing the public to change the ways of doing things that may date back generations.

Therefore, the program must be more educational than prescriptive.

A major part of nonpoint control revolves around managing land uses. Land use decisions must account for local, geographic and demographic situations. The problems we are trying to address in the plains of Wyoming are necessarily different from those in more populous areas. The Governors stress that States must retain the flexibility to tailor nonpoint management measures to local conditions and oppose prescriptive Federal definitions of specific management measures.

The Governors believe the current reauthorization should build on the existing 319 Program and offer suggestions concerning funding, achieving management goals, and consistency of Federal activities with State management plans.

First, insufficient funding is really a critical problem facing State programs. Since 1987, only \$190 million has been made available to support the Section 319 Program. To put this into perspective, consider, for example, the joint EPA-USA Rural Clean Water Project. This demonstration project spent \$70 million to treat only 21 local watersheds. Although no one knows the extent of the Nation's nonpoint source pollution problem, there are probably thousands of watersheds requiring similar levels of treatment.

Program funding must be stable as many projects will involve multiyear efforts. The States and project participants must be able to depend on a consistent level of funding. We have too many examples in Wyoming of good projects that failed because they weren't carried to fruition due to lack of funding. Worse yet, we have too many individuals and groups that become jaded because they were involved in a project that wasn't completed.

Second, the program needs more structure. Note that I say structure, not proscription. Currently the guidance in the Nonpoint Source Program is extremely vague. Other than informing us that we are supposed to prevent nonpoint source pollution, the guidance is of little help in achieving our goals.

NGA policy recommends development of a framework involving more clearly articulated management goals, a process to define progress and some mechanism to rework plans that do not meet expressed goals. States should establish more clearly defined goals for NPS plans based on either measure of water quality or measures of program administration such as number of best management practices in place. States should identify benchmarks to measure progress towards meeting specified goals.

If State programs do not produce results, States should be required to adjust Section 319 plans. States need help from EPA in defining a clear direction for the program. EPA should assist the States in defining goals and measuring progress. However, I emphasize that EPA should not mandate the use of specific best management practices. BMPs must be tailored to local conditions. In many instances, they will, in large part, be a compilation of practices already developed by Federal, State and local agencies.

Finally, the Governors recommend a certification process to ensure that Federal activities are consistent with State NPS plans. Appropriate Federal agencies should have input into the develop-

ment of the BMPs and should be required to implement them as part of their land use planning.

With regard to stormwater, the Governors agree that reducing stormwater contamination is important in achieving the fishable, swimmable goal of the Clean Water Act. The Governors stress, however, the law must recognize the differences between stormwater and typical point source pollution, and the difficulty in using the NPS Program in addressing stormwater.

Although it is discharged at discrete outfills, stormwater is really nonpoint pollution. The regulation of point source discharge is based on known flows, processes, plant performances and technologies not available for stormwater.

The Governors believe the Clean Water Act should clearly authorize the use of site specific, best management practices to control stormwater. Because stormwater is generated from a variety of sources and activities, BMPs are the most effective controls.

The Governors also believe the Clean Water Act should allow States authority to use enforceable nonpermit approaches to control stormwater. The magnitude of the burden that stormwater permitting programs can have on a State cannot be overstated. In Wyoming, we calculated that issuing individual NPDS permits to all stormwater sources would multiply the number of permits we issued tenfold. We would need ten times as many staff and the additional funding that goes along with it. Using general permits and BMPs, we were able to do it with existing staff. The Governors believe that States must have the authority prioritize stormwater controls based on risk.

Finally, NGA recommends a three-year extension of the municipal stormwater compliance deadline.

With regard to wetlands, wetlands in their natural state serve important ecological and socioeconomic functions that are difficult to replace. Development of a workable national policy to promote conservation and wise management of these resources is of great concern to the Governors.

NGA policy suggests that the national policy should reflect several important principles. Today, I would like to draw attention to six of those principles.

First, the Governors believe that land use regulations such as wetlands programs are effectively administered at the State and local level and that the Wetlands Regulatory Program should facilitate State involvement through the full State assumption or State program and general permits. The Governors suggest several measures to encourage States to assume the programs. They believe that options could be partial assumption that we could negotiate with the Government for appropriate pieces that would fit our State and the Federal Government should establish clear goals for the protection of the wetlands and design the programs accordingly.

The Governors also support an amendment to the Clean Water Act to clearly authorize the use of Corps of Engineers-issued State Program General Permits that substitute State program authority for the Federal Program. State Program General Permits are an alternative method for States to assume partial responsibility for wetlands regulation.

Second, wetlands regulatory programs must recognize regional variance in wetlands. The nature of the wetland resource and of land use varies dramatically in different parts of the country and management policies should be tailored to these variations.

Third, the Governors believe the definition of wetlands and delineation criteria that are scientifically valid, legally defensible, and workable in the field is a foundation of a practicable protection and management program.

Fourth, the Governors assert that regulatory practices should include a sequential approach to mitigation that begins with avoidance of adverse effects on wetlands and minimization of unavoidable adverse effects and lousy use of compensatory mitigation as a last result.

At the same time, however, the policy must allow regulators the flexibility to act rationally weighing socioeconomic factors.

Federal programs should involve a substantial research component targeted in particular toward developing improved methods creating and restoring wetlands and accurate methods of assessing wetland functions and values. We need better science on these important questions.

Sixth, the regulatory program should be complemented with a nonregulatory program. The Governors emphasize the value of wetlands, restoration and creation through cooperative initiatives between Government and the private sector. The North American Waterfowl Management Plan administered by the Fish and Wildlife Service and wetlands conservation provisions of the 1994 Food Securities Act are successful examples of such initiatives.

In addition, NGA policy addresses some specific management issues, including wetland classification, mitigation banking, regulation of managed wetlands and compensation of private propertyowners. NGA opposes the imposition of a National Classification System, but classification systems tailored to individual watersheds could be useful in developing regional and local resource management plans.

The Governors believe in mitigation banking as a useful tool, given careful management. In Wyoming, we have approached wetland banking and we believe we have the technical expertise and the resources to administer such a program. However, at this point, our efforts have been frustrated by a lack of coordinated, consistent Federal policy. Federal policy on banking could allow infrastructure improvements to proceed while providing effective and efficient wetlands mitigation.

NGA policy states that wetlands created and maintained solely for the use in resource management—for example, stormwater abatement or water fowl production—should be exempt from regulation under Section 404.

Finally, the Governors oppose mandatory compensation of propertyowners for wetlands regulation. This issue is appropriately addressed in the courts which have established sound criteria for determining when a regulatory taking has occurred.

This concludes my written testimony. Mr. Chairman and members of the subcommittee, thank you for the opportunity to testify today. I'd be happy to answer any questions.

Mr. APPLGATE. Thank you very much for your testimony.

I want to depart at this moment from going through the witnesses because we are all so privileged to have with us the Chairman of the full committee, Norman Mineta of California. I will yield to him at this point.

The CHAIR. Thank you very much, Mr. Chairman.

I appreciate this chance to interrupt the proceedings at this point.

First of all, I'd like to thank you, Mr. Chairman, and Mr. Boehlert, for your continuing leadership in holding this series of hearings dedicated to the reauthorization of the Federal Water Pollution Control Act, better known as the Clean Water Act.

Without a doubt, the reauthorization of the Clean Water Act is a task that Congress has not only performed three times since 1972, but in this Congress, really becomes the most important piece of legislation that the Public Works and Transportation Committee will be handling, and the stakes are very, very high.

One essential challenge before this Committee is to reverse the idea now in law that fiscal year 1994 is to be the last year of Federal participation in addressing the national problems of wastewater treatment.

Another essential challenge is to refocus clean water policy so that it does not focus on one polluter or a few polluters, but on what can be done most cost effectively to reduce pollution on a watershed basis. We have had the help of a number of wonderful groups represented by many of those in this room in establishing our past water policy. You have seen how past law has worked and we expect that you will help us during these hearings to improve where we want to go in order to make this a workable piece of legislation.

Again, I want to thank all the witnesses who will be before the Committee, and Robbi, it's good to see you.

Ms. SAVAGE. It's good to see you, Mr. Mineta.

The CHAIR. We've had a long relationship here through your expertise and my local government experience.

Again, I appreciate all of you being here and helping us to understand where we ought to be going in the future.

Thank you, again, Mr. Applegate and to Mr. Boehlert as well, for your leadership.

Mr. APPLGATE. Thank you very much, Chairman Mineta. We appreciate your being here. We appreciate your words and we know that you'll be in there in full support of the directions that we have to take in order to accomplish our goals. That will be extremely important as we move along the process.

I would like to mention to the witnesses, we would like to keep this as short as possible and if we could keep it down to 5 minutes, I would appreciate that because we want to leave adequate time for the committee to be able to toss out some questions to you.

At this point, let's have Robbi Savage.

Ms. SAVAGE. Thank you very much, Mr. Chairman. Thank you, Mr. Boehlert for being here, and of course, Mr. Mineta, thank you very much, not only for being here for the hearing but also for the work that you've done on the stimulus package. To go to the President and ask for money for this program, I know, is something you feel very strongly about. We wish there had been more in the Presi-

dents' Request but I certainly thank you for all that you did to make sure our clean water program was incorporated in the President's package.

Mr. Shuster, thank you very much for being here. I appreciate it.

The CHAIR. Very importantly, if I might interrupt, part of that was the 20 percent waiver.

Ms. SAVAGE. Thank you so much for that. We really appreciate it very much.

As indicated, my name is Robbi Savage. I'm the Executive Director and Secretary-Treasurer of the Association of State and Interstate Water Pollution Control Administrators, otherwise known as the State guys.

Our association was created in 1961 as the professional forum of State Administrators of the Clean Water Program. My office was established in January of 1979. Fortunately for me, at least, at this point, I am the first and only Director of the Association.

The Clean Water Act, we believe, is fundamentally sound and I think, for the most part, we share that philosophy with the members of the committee. We've worked long and hard since 1972 to put a framework into place that is effective and we feel fairly comfortable that we're moving in the right direction, and that the waters, in fact, are becoming cleaner as we speak.

Our association is putting together a 20-year status and trends analysis that we will have before this committee in early May to let you know just what has been accomplished in the 50 States with the money and the guidance that you've provided. We're very enthusiastic that the 50 States have participated.

There are a number of issues, however that we do need to look at as we evaluate our clean water program and ways to make our law even more effective than it currently is. Of course you wouldn't expect me to come before you without talking about two very important things on behalf of the States and that, of course, is money and State flexibility, so I won't let you down.

We have also shared our views on this issue with the President in a letter that I've provided for the committee to talk about the opportunities under the stimulus package for flexibility, the elimination of the State match, and so on, and of course, adequate funding for this program.

We have also had, Mr. Chairman, significant delays in the issuance of guidance. When, in fact, members of this committee and the Congress pass laws and have them out for the States, we need the Federal agencies to act swiftly to get that guidance and those regulations out to the States. Ultimately, State and local governments are held accountable for meeting the Act's requirements and the deadlines, and yet if we don't get the kind of leadership from the Federal agencies that we need to do the job, especially in the time frames necessary, it makes it very, very difficult for us.

Again, we do need adequate time to carry out the requirements of the 1987 amendments. Many of you were involved in the development of that statutory language and we are just beginning to see the fruits of that labor. Most of you also know that the major requirements for toxics, nonpoint, stormwater and so on did not receive funding through the Clean Water Act, so that's an area where

the States have had to tread very lightly without the assistance of funding.

To add to these concerns, ASIWPCA would call on the House to reinforce that States must continue to have the lead role in development and management of the Clean Water Program. New Federal mandates must be accompanied by increased State flexibility in funding.

The Governors, as Dennis said, have taken a fairly strong position that new mandates coming from the Congress, not only on environment, but on any legislative mandate, must be accompanied by appropriate funding. States are just not in a position to take on new responsibility absent funding.

We need to define what the continuing Federal role is, not only in the State Revolving Loan Fund, but in our other programs.

Following up on Mr. Applegate's suggestion that we be swift in our discussions, you have our testimony and our positions that were developed by the 50 States, so I'd just like to touch on seven points and I'll be very brief in them.

State management of the national program under Section 106 is something, of course, very near and dear to our heart. It's not very much money. When you look at \$70 or \$80 million and you divide that by 50 States and interstate commissions, it can be less than \$1 million for a State to do their work. On the other hand, what you ask the States to do with that money is to issue permits, to monitor, to enforce, to manage their sludge programs, to do pretreatment, and on and on—toxics, stormwater and whatnot. A million dollars doesn't go very far in a State with those kinds of mandates.

We'd like for you to really evaluate what you're asking the States to do and see if in fact the commensurate funding is made available which, of course, we believe that it is not.

As regards the State Revolving Loan Fund, Mr. Mineta and Mr. Roe, who is always smiling up at us now from the top of the rafters here, were very, very instrumental in the development of the State Revolving Loan Fund. In the early days, we did talk about the potential to have some kind of setaside for small and hardship communities. So if you go back, and I know Errol, Gabe and the staff have done this, to some of the original language you will see that we did have a small grants program for hardship communities that we might want to follow at this point.

We do, as an association of the 50 States and as the Governors, oppose the reinstatement of the Construction Grants Program. The reason for this is that all 50 States now have incorporated the State revolving loan fund as a part of their program. It's working, it's providing the necessary funding, and we're very concerned that if we reestablish a grants program, any sane human being would wait for a grant instead of proceeding with a loan. We think the result of that would be that we'll have delayed compliance and that we will have an undermining of the State Revolving Loan Fund that we've all worked so hard to put into place.

We also want to ask that you eliminate the crosscutters. There are some 28 separate Federal statutes that apply under the State Revolving Loan Fund, for example, historic preservation and on and on. There are all these extemporaneous laws that have social

goals attached to them, but when you're trying to build sewage treatment plants and clean up the water, it's very difficult for a small community to administer.

There are also a number of Title II requirements that are hold-overs from the Grants Program. Those would be the 20 percent set aside that Mr. Mineta indicated. Governors are limited to spending only 20 percent of their funds on such things as nonpoint source, wetlands, watersheds and so on. We would like to see you lift that.

Also, the requirements for innovative and alternative technologies. We are pushing the envelope on this issue already and we certainly don't need it incorporated in the law.

We need to see some streamlining from the EPA. This is not a grants program, it's a loan program. When you buy a house, you go to the lender and they give you a loan. They don't tell you what kind of drapes to put in your house and they don't tell you what kind of furniture, and they don't tell you when to clean the house and have the cleaning people come or do it yourself, which I refuse to do, but nevertheless, in this program that's exactly what we're getting.

The Inspector General is telling those local governments what kind of furniture to put in their offices, what kind of specific details need to be incorporated in the development of their sewer plant. This is just unacceptable under a loan setting. So we need to go back and do some housecleaning in the State Revolving Loan Fund and get rid of some of those unnecessary oversight positions.

We, of course, want to see the States have the continuing lead role in this, whether it be the Drinking Water Program or the Clean Water Program. If, in fact, that is through legislation, we hope that you will work very closely with the existing Clean Water SRF to develop the drinking water SRF. The last thing we need is two separate tracks of these programs coming together and coming apart while the States have to administer both programs.

I won't spend too much time on pollution prevention. I'd like to see you incorporate that theme. It's a philosophy of management. It's not something that we simply do, it's something that should be throughout the course of the entire Clean Water Program.

Nonpoint sources are a real frustration for the States. We don't look very good in the Nonpoint Source Program and there's a reason for that. Section 319 is a demonstration program. It puts the States at odds with one another under a beauty contest or an ugly puppy contest, whichever you choose, to debate one another, to write grants and, in fact, be at a competitive situation with one another.

What we need to do is build a national, comprehensive, nonpoint source program by increasing the capabilities of the States to manage nonpoint sources. If you give them a one-time project grant, they can't keep those professional staff people onboard, they can't manage an effective program, and they can't lobby their own legislatures for additional funding. So we really want to see funding, stability and a long-term commitment of the Congress to do a good job on nonpoint sources because we're not looking good, as I said, in that program.

Regarding Watershed protection, and then I will summarize. We must have the States in the lead role. We would oppose any legisla-

tion that would call for a new level of government. We can't even afford the level of governments we have, let alone putting on a whole new layer to manage watersheds.

The Constitution of the United States puts the States in the role of managing the health and welfare of the people of that State. That to me would include managing the watersheds and the basins. We don't need new legislation. The original authors of the Clean Water under Section 303(e) already dealt with watershed and basin planning. We might want to do a little tweaking there but we don't need a whole new program, especially if we're not going to get any new money for it, which I assume there isn't much left in the pot for these kinds of things anyway. So we would oppose any new level of government being created.

Last, for stormwater, the guidance was late, the money is not there. A number States—I'll give you Vermont as an indicator—Vermont says that their Stormwater Program will be ten times their existing NPDES Permit Program. With no money attached to the Stormwater Program, that is an impossible task for a State to achieve. So we would say we need to go back and look at our Stormwater Program, see what the deadlines are, if we can meet them and put a realistic stormwater program in place.

We need stormwater programs, States are doing a good job where they can, but it needs a "real look" see as we go through reauthorization.

Finally, I would say, Mr. Chairman, 100 percent we support the National Governors' position on small and hardship communities. Many of these small communities cannot find their way to the Loan Program. Within the context of SRF, we would support some funding for small and hardship communities. We definitely do not want to see a whole new structure created for management of such a program, however.

I'll summarize with that and again, thank you, Mr. Chairman, for holding these hearings and compliment you both, minority and majority, for having outstanding staff. We enjoy working with them.

Thank you.

Mr. APPLGATE. Thank you very much for your testimony.

Next we will hear from Terry Agriss.

Ms. AGRISS. Thank you, Mr. Chairman and members of the committee.

My name is Terry Agriss. I'm president of New York State's Environmental Facilities Corporation and, as such, administer the New York State Revolving Fund. I'm pleased to appear before you today to testify both in my capacity as a New York State official and also as President of the Council of Infrastructure Financing Authorities, known as CIFFA.

CIFFA is a national organization of State and local authorities whose mission is to finance public infrastructure facilities. Most of our State members manage at least the financial component of the State revolving funds for wastewater treatment and, as such, we're vitally involved in the current and future success of the SRF Program. My testimony today will address Title VI of the Clean Water Act and the SRF provisions.

CIFFA supports reauthorization of this program which, from our experience as State managers, is working extremely well as an efficient and economic mechanism to provide low cost financing for public wastewater treatment needs. The SRFs have fulfilled the vision which Congress had when it created the loan funding mechanism in 1987. We urge the committee and the Congress to extend the programmatic and financing authority for Title VI which, with some minor legislative adjustments, can address the Nation's major needs for wastewater funding well into the next century.

In support of this assertion, there are several points I would like to make to the committee. I'd like to summarize these. I believe you have my written testimony.

As both NGA and ASIWPCA have noted, all 50 States, plus Puerto Rico, now have implemented the State Revolving Fund Program. We had a survey done by the State of Ohio for CIFFA which indicated that as of June of last year, we had received in the State, \$6 billion in Federal grants and we had matched that with our 20 percent State share.

Including leveraging which is perhaps a unique factor in this program, the total loan pool as of June 1992 was \$10.7 billion. Out of that, as of June, 1,363 project loans had already been made. We think this is enormous testimony to the effectiveness of the SRF Program.

In addition to traditional sewage treatment plants, projects that had been funded included combined sewer overflow projects, stormwater and nonpoint source control projects. We think that the SRF allows us tremendous flexibility and we've been very creative in how we use them.

One of the things we would like to note is we are very encouraged about the suggestions by the Administration regarding adding drinking water as an eligible activity under an SRF Program. We would strongly encourage you to include drinking water in the existing SRFs. While we recognize the jurisdictional questions here, we do believe that it would be far more efficient to include both types of activities, drinking water and wastewater, under a single SRF.

There are significant credit issues that would enhance the drinking activities if these programs could be combined, particularly for those States that are leveraging their SRF monies.

You have heard from your constituents, and perhaps some of your colleagues that local governments would prefer to return to a grant program rather than the SRFs. I'd like to expand a little bit on what my colleagues have said this morning.

We think that returning to a grant program really is not the way to go. There are some local governments that have been appearing regularly in Washington recommending a return to grants or asking for specific authorization for grant programs for those projects. Some of those are local governments that had opportunities under the old Construction Grants Program, did not take advantage of them, while others proceeded to meet the criteria and to participate in the Grants Program or, in fact, to go ahead on their own. We think it would be unfair to now reward those communities that had not participated previously.

Let me give you a few examples of why we think the Loan Program is the right decision. It has been terribly effective and we would like to ask that it be continued.

Loans provide assistance to more projects. If, in fact, the SRFs were financed say at \$2 billion a year for 12 years, you would fully capitalize the SRFs. What that means is that you would be able to finance on an annual basis at least the same amount of projects that you could finance with the first year's capitalization so that over a 20-year period, even with just 12 years of capitalization, you would be able to finance \$133 billion worth of projects. With a grant program over that same period, you would have \$4 billion in projects, less than one-third, that are possible under the SRFs.

As you know, EPA has estimated the current needs of wastewater treatment to be in excess of \$100 billion. We think the SRFs clearly are the way to meet this.

Also, when fully capitalized, the SRFs can assist you to reduce the structural deficit that we have been facing in that you can, in fact, reduce the amount of money or, in fact, eliminate it, other than perhaps small contributions to keep pace with inflation after the funds are fully capitalized.

Further, loans are more efficient. Municipalities, when they are in fact receiving loans as opposed to grants, look at the types of projects that they are building and determine how to do the project least expensively. We've had experience in New York State where communities that had initially expected to come in under the Construction Grants Program had designed projects that were able to meet all of the Grant criteria and because the community really was paying only a very small share of those projects, tended to be what we call Cadillacs. Under a loan program, some of those communities are now building Chevies.

We have experience where communities have built projects that literally cost about half of what the cost of a project would have been under the grants program. Communities care about what their projects are like when they have to pay for them.

Also, projects are built faster under the loan program in that communities can start construction on their projects as soon as they are ready. Under a grant program, communities had to wait, get in line for a grant, and then have to receive approval before they could begin construction.

If a community, in fact, went ahead and started a project prior to having grant approval, they jeopardized the entire grant. The SRFs are able to refinance projects so that a community can start at any time and come in when they are ready for an SRF loan. In fact, many States have taken what we call a no-wait policy and will finance projects as soon as that project is ready to go.

Because the States are able to leverage their funds, that is to issue bonds in the public bond markets, we can expand the amount of capital that is available under the loan program and therefore, we can make the loans whenever communities are ready. Communities don't have to stand in line, they can come get their financing when they are ready to go.

A very significant issue that has been raised—I know, Mr. Chairman, you are particularly interested in this, and Mr. Boehlert—regards small communities. Many people have asked the question of

small communities and loans, how can they participate. As Robbi indicated, one of the ways of doing this is through technical assistance.

In New York State, we have a program called Self Help where we do provide technical assistance to small communities to help them design their projects and look for the least costly way of achieving water pollution control objectives. This is a program that EPA has allowed us to fund under our administrative monies in the SRF, but it is something that I would suggest you might want to look carefully at and use as a model and encourage EPA to allow us to provide this kind of technical assistance, particularly for small communities.

Another point that is frequently overlooked is the Rural Development Administration has monies to provide grants for small communities. In fact, under the President's proposals, those monies would be significantly enhanced. While I recognize that many States have had problems working with their local RDA offices, we believe it can be done and, in fact, in New York we have worked closely with RDA to combine the programs so that a small community has, in many cases, received an RDA grant, in some case an RDA loan, and also an SRF loan. These programs can work together.

There are other instances where not only have we participated with RDA, but also with HUD under the CDBG Program so that funding can go to a small community from at least three sources and we believe that this is the way to go. Our goal in New York and what we would recommend elsewhere is that the agencies work together to provide the best deal for the communities. We believe this can be done.

The other issue under the State Revolving Fund Program is if you have done everything you can, you've provided technical assistance to the small communities, you've worked with RDA, you've worked with HUD and there are still problems in getting an affordable project to a community, what else can you do?

We believe what we call a principal subsidy is the way to go. A principal subsidy works very similarly to a leveraged loan under the SRF Program in that we would take capitalization monies from the SRF, the Federal dollars with the associated State match, set those monies aside in a reserve account for an economically disadvantaged community. We would make a zero interest loan to the community under the SRF, and then we would take the interest earnings off that reserve account and provide the interest earnings as part of the principal payment that the community would have to make.

Some people say it sounds an awful lot like a grant because the amount of money that the community must repay under a principal subsidy program is reduced. However, there is a very important distinction between a principal subsidy and a grant. That is, because the principal subsidy comes from interest earnings on a reserve, you're never actually invading what we call the corpus or the capital that is in the State Revolving Fund.

So if the State Revolving Fund started out as a \$50 million fund and it made a loan to a small community, and made a principal subsidy payment, because you're only using interest earnings, your

fund is still going to remain at \$50 million. You have not reduced the size of the fund and we believe very strongly that your intent was that the SRFs are inviolate, that we should maintain their value over time, and this is a way to do it and still provide the assistance to the small communities that they so desperately need.

We have greater detail on all the points that I've made in my written testimony and I would be very pleased to answer any questions.

Thank you very much for the opportunity to appear before you. Mr. APPLGATE. Thank you very much, Ms. Agriss.

Mr. Slade.

Mr. SLADE. Thank you, Chairman Applegate.

I'm David Slade. I'm Director of the Coastal States Organization.

First, let me extend my regrets, Gail Shaffer, the Secretary of State of the State of New York, wanted to come down and testify. This is a topic that is near and dear to her heart and strongly in her interest but she couldn't make it today, so I am here to do that.

The Coastal States Organization is a representative association of the Governors of the 30 coastal States on the Atlantic, Gulf of Mexico, Pacific and the Great Lakes, plus the five commonwealths and territories of the United States.

We've wrestled with the many questions involved with the reauthorization of the Clean Water Act for a long time. As of November, we came up with the consensus of my organization on five topics: contaminated sediments, combined sewer overflows, the National Estuary Program, nonpoint source pollution control, and finally, wetlands. I will summarize them, Chairman Applegate as quickly as I can. You have my full statement and I request that be incorporate into the record.

As we've gone through, we've had three principles in mind. One, we'd like to better coordinate the existing Federal programs that are already out there. Many Federal programs have responsibilities under the umbrella of the Clean Water Act. Second, we'd like to best utilize scarce Federal dollars. I think everyone is in agreement on that. Third, we want maximum flexibility of the States to address these many problems.

On contaminated sediments, we believe the Clean Water Act should be amended to clarify that the State water quality standards approved by EPA in accordance with Section 303 be binding on the Army Corps as well as on any other person who is seeking a permit.

In 1988, the Army Corps enacted regulations for their operation and maintenance dredging. Under those regulations, they set a "Federal standard" but through those regulations, the Army Corps does not incorporate Federally-approved State water quality standards into their Federal standard. By doing that, the Corps supercedes Federally-approved State water quality standards, which guts both the letter and the spirit of the Clean Water Act.

We also believe that much stronger effort should be made on prevention of the contamination of sediments, obviously, the least costly route and again, coordinating the existing Federal programs. I think Congress should look at developing new or enhancing the existing programs such as nonpoint pollution control, the industrial pretreatment and stormwater management programs in order to

provide the assistance to States for preventing sediment contamination.

Finally, I'd like to note that the recent amendments to the Ocean Dumping Act that were done by the Water Resources Development Act of 1992, which addressed the contaminated sediments, only apply to those ocean waters beyond the low water mark. They do not apply to many bays and estuaries, nor in the Great Lakes. We believe that they should.

On combined sewer overflows, we think that the variety of factors ought to be looked at before the abatement program is put into place. These factors are the degree of water quality improvement that would be the result of a combined sewer overflow upgrade, the amount of benefit to natural resources and the wildlife habitat, the feasibility of elimination of any combined sewer overflow, what alternatives there are to just upgrading the combined sewers, a comparison of the elimination versus alternative costs, and of course, a look at the financial resources of the responsible government entity and the financial resources available from the Federal Government.

In these tight budgetary times, at every level of government, remedial measures should be undertaken in priority. Focusing first on those combined sewer overflows which cause the most environmental damage, the best strategy with such limited funding is to first implement those combined sewer overflow abatement measures which deliver the maximum benefits in water quality, natural resource and wildlife habitat.

We believe the precise mix of the control measures will vary depending upon local conditions and for this reason, the Federal assistance should include a full range of alternatives available to the States, including but not limited to enhancing industrial pretreatment, implementing best management practices and stormwater and watershed management.

The third topic is the National Estuary Program. We'd like to see better coordination between the National Estuary Program, which is established under the Clean Water Act, and the State Coastal Zone Management Program established under the Coastal Zone Management Act. Again, this is not only good management, it's better for budget planning and you get better results for both programs combined.

A significant shortcoming, in our view, of the National Estuary Program is its failure to institutionalize the management plans. That is, these plans contain recommendations but don't have the teeth of enforceable policies. One way to give the management plans more teeth is for them to be incorporated into the State Coastal Zone Management Plans which are statutorily required to contain enforceable policies.

If you look at the legislative history of the 1987 Clean Water Act amendments, it suggests that these management plans are supposed to be incorporated into the State CZM plans but to the extent that this has happened really varies State by State. We believe that a legislative directive is needed to ensure the full coordination between the National Estuary Program and the State Coastal Zone Management Program.

Under the former Administration, the U.S. EPA's policy was not to provide funding for implementation of the NEP management plans but they would provide money only for the development of those plans. We think after the development of the management plans, the Federal Government cannot walk away and say that its participation is finished. If the NEP Program is to be successful, there must be Federal assistance to the implementation of the National Estuary Program plans.

One way to do this is to make States eligible which have approved management plans, make them eligible for SRF funding. Finally, because of the unlikelihood of any additional Federal funding, we believe that we should concentrate on ensuring the success of the 17 existing management plans rather than trying to expand this already stretched program even further.

Nonpoint source pollution, since 1987 when Section 319 of the Clean Water Act was enacted, nonpoint pollution has gained even greater attention as a contributor to water quality degradation. While Section 319 programs are being developed, at the same time, Congress retooled the nonpoint source control effort in the Nation's coastal areas by enacting what is commonly known as Section 6217 of the Coastal Zone Management Act which is the Coastal Nonpoint Pollution Control Program.

The Coastal Nonpoint Pollution Control Program, under the CZMA, requires State nonpoint source and coastal management programs to utilize both the best available technology that is economically achievable and water quality standards in coastal areas for controlling nonpoint source.

The problem arises in that the CZM Coastal Nonpoint Pollution Program provides for sanctions against both that program and the Clean Water Act Section 319 funding in the effect that a coastal State has not developed an "approvable" coastal nonpoint source pollution program.

For fiscal year 1992 and fiscal year 1993, the Federal appropriations for the development of the Coastal Nonpoint Program under the CZMA was only \$2 million in each year which breaks down to \$70,000 a State which really doesn't pass the giggle test when you look at it. It's a setup for failure. If the mandatory Coastal Nonpoint Pollution Program under the CZMA is so drastically underfunded, it's doomed to fail and when it does fail, it has a 30 percent sanction against the funding not only for the coastal program but a 30 percent sanction against funding for Section 319 under the Clean Water Act, which doesn't make much sense to us.

We believe that Congress should amend the sanction provisions against 319 and the CZMA Coastal Nonpoint Source Pollution Control Program and allow the administrators of EPA and NOAA to have the discretion to limit the use of sanctions only to situations of last resort. Good faith efforts on the part of States to meet the Section 6217 requirements shouldn't be penalized, especially when adequate Federal support for this mandated program has been so lacking.

Finally, the fifth topic, the least controversial of them all, wetlands, we believe, as a matter of philosophy, that if Congress is going to define or delineate wetlands, that should be on a sound,

scientific base and we're talking about science science and not political science.

We also take a look at approaching wetlands preservation through the 404 Program alone. The 404 Program was a water quality program and of course water quality is important to wetlands preservation, but, as you've heard today, wetlands are also important for many other things such as wildlife habitat, recharging of aquifers, flood control and so on.

Although we believe Congress should provide for greater protection of wetlands, perhaps the Clean Water Act should have its own standalone section dedicated to wetland protection rather than trying to retool the 404 Program.

Another problem in this area is the effect of the Army Corps' nationwide permits on wetlands. Nationwide permits are only authorized for activities which have a "de minimis" impact on the aquatic environment. The Army Corps, however, reasons that because the impacts are minimal, there is no need for any monitoring or reporting, but these unreported and unmonitored activities number in the tens if not hundreds of thousands all around the United States.

Although the assessment of cumulative impacts is required under the Clean Water Act, to our knowledge, the Army Corps has never considered the cumulative impacts in the administration of the nationwide permit program. Reporting and monitoring requirements need to be statutorily mandated by the Clean Water Act.

Finally, the Army Corps refuses to comply with a State's denial of a nationwide permit based on its federally approved water quality standards or its federally approved coastal management program. The Clean Water Act should be amended to clarify that it is solely the prerogative of the State to determine which discharges are subject to water quality certification authority and that no nationwide permit should be available where a State has been denied certification or found the nationwide permit to be inconsistent.

Mr. Chairman, that concludes my remarks and I will try to answer any questions you or the subcommittee may have.

Mr. APPLGATE. I thank you very much for all of your statements. It's obvious that you are very well versed. As you had stated, each of your statements will be included in the record in full.

Incidentally, we want to try to restrict the questioning to five minutes each and if we run out of time, which I'm sure we will, we will be asking you to answer questions that will be submitted to you from time to time because it will be invaluable in the assistance that we need to come to the conclusions that we hope we can reach.

I noticed that most are interested in including drinking water in the State Revolving Fund in some kind of a method. I would suggest I would have no objection. As a matter of fact, it would probably be a pretty good idea to put that in.

There are problems, one of which is not the least, and that is there is a jurisdictional problem within the Halls of Congress. Whether or not we would be able to do something about that in this session of Congress is highly unlikely. However, I think down the road, it's something that should be addressed and I think that it will. That remains to be seen.

Also, I noticed that most do take an opposing view of the "old grants program" that we had and something that I had looked upon somewhat favorably. We will address that as we go along and there would be no intentions of having a drag on the existing amounts of money that the State Revolving Funds already receive. I think it was addressed by Ms. Agriss to some degree on how that can be accomplished through certain formula that you were talking about for technical assistance, and we will see.

First of all, I have a question for Mr. Hemmer. We've been looking for ways to improve the existing nonpoint pollution program and as you know, many States have identified nonpoint pollution as the largest remaining water quality problem. In 1990, Congress required EPA and NOAA to develop guidance for States to use in developing enforceable nonpoint pollution control programs in the coastal States.

While I recognize that Wyoming is not a coastal State, does the National Governors' Association have a position on a coastal zone nonpoint program and whether it could be expanded to apply nationwide?

Mr. HEMMER. Mr. Chairman, as you note, Wyoming does not have any coasts and I'm going to have to plead ignorance as to whether or not the NGA has a position on the coastal portion of it. I believe it is our position that we would not like to see the Nonpoint Source Program become an enforcement program because I think at that point it takes already scarce resources and probably isn't as effective, if we can, through education and other measures, affect the societal changes we need to in essence prevent the pollution.

Mr. APPLGATE. You don't know whether the NGA has a position on that?

Mr. HEMMER. We do not.

Mr. APPLGATE. You do not.

Robbi Savage, many Clean Water Act interests have been advocating a watershed approach to addressing water quality and I guess that will be addressed by the TVA when they come in on May 5. Your organization advocates States taking the lead role in developing and implementing this approach. Other than the usual funding concerns, can you identify impediments in the present law which restrict the ability of the States to address the water quality programs on a watershed basis?

Ms. SAVAGE. Well, I'd like to spend a little time with the philosophies incorporated in the Basin Planning Program under section 303 that's currently in the law. Basically, what we said in the early days, or you all said, was look at the entire watershed and basin within the context of your State and plan for how you want your community and your State to grow and develop.

Sadly, in the early 1970s, with the 208 areawide planning and section 303, the planning sections got left behind as we were in such a hurry to get all those big construction grants out to local communities. Now we're in the position of going back and saying, now we have all this hardware and we have all these decisions that have been made, maybe we should have done some planning in the beginning and now let's call it watershed. It is not new. It is some-

thing that we should have been doing and many States have been doing from the outset.

The concern that we have with some of the watershed proposals that are circulating is that it provides the opportunity, one, for communities to focus only on nonpoint sources. Quite frankly, this is one of the suggestions of a couple of organizations that, all right, we've done our job in the point source area, most of us are at secondary treatment, so leave us alone for a while and focus on nonpoint, get those farmers, get those other guys, and let us do our thing. Some of the industry folks would like to see us do that as well.

We're very concerned that a watershed proposal has to be balanced in such a way as to provide for a nonpoint source focus which we sorely need but also to maintain the integrity of the Point Source Discharge Program. To take one over the other is simply not an efficient way to manage the money and a waste of the money that we put in if we ignore our Point Source Program. If we use watersheds as a diversionary tactic away from point sources, then we're not doing our job.

The second issue that some of our friends are promoting with the watershed proposal is to have an opportunity to downgrade standards and designated uses. There are times when science becomes more effective, when we learn more, that this may be necessary, but certainly not on a wholesale basis.

We don't want to turn the focus away from good science, but we want to maintain the integrity of our water quality standards. There are areas where they need to be more stringent and there are areas of our country where perhaps we can look at downgrading standards, but I don't want to use, and our association doesn't want to use, watersheds as the mechanism to go around the country downgrading water quality standards, though I wouldn't suggest that is the intent of any of the organizations, but in fact, that might be an opportunity.

While watersheds should be focused on at the State level, it's a very good opportunity to bring all the interests together to look at how you manage the water of your State, to focus on those priority programs within your State that are not being dealt with, to look at how the pollution sources are affecting the streams in your community and the States and then to make comprehensive decisions. It's about time that we do that, the initial authors of the Clean Water Act told us to do it, and now we need to get back to doing what we were supposed to do in the first place.

Sadly, planning does not have a very good reputation but it's the very important component that was missing while we were building all these sewer plants.

As we talk about nonpoint source, Mr. Chairman, I think it's important that we balance the issues of enforcement and voluntary programs. We'd like to look at an opportunity to develop some language that would say, let the States and the communities and the farmers have an opportunity to do it right the first time under a voluntary program. Perhaps if they are not doing it right under a voluntary program, we should develop other ways of dealing with the Nonpoint Source Program to solve our nonpoint source problems.

There is no way we can get around the fact that we have major nonpoint source problems in this country and we have to do something other than talk about it. A demonstration program under Section 319 is not the only way to deal with this. We need something far more comprehensive than that.

We would suggest that on the CZMA language, we need a little more education and a little more implementation of that program before we wholesale put it in the Clean Water Act. So we're very concerned about just taking that piece of legislation and flopping it into clean water without having some time to know if it works effectively and what the glitches are in that program.

Mr. APPLGATE. Thank you. I'll get one more question in and I'll let the committee ask.

To Terry Agriss, getting back to what we were talking about before, in your testimony you urge the continuation of the State Revolving Fund Program and oppose the return to grants. I'm not sure we want to say we're just going to cut off loan programs and go to grants, I was looking for a combination.

In February, we did hear testimony from the small rural communities which indicates that even no interest loans can't meet the needs of certain communities. I know that to be a fact in my own area. You advocate using a set aside to earn interest to assist communities with principal subsidies. In today's economic climate marked by low interest rates, do you believe that such an arrangement can generate such an income to adequately assist these communities and what about the possibility of developing a repayment schedule which would generate enough income to subsidize economically-disadvantaged communities?

Ms. AGRISS. The low interest rate environment has some interesting repercussions obviously on the running of a loan program but we do believe that we could, in fact, invest the reserve funds at a return that would be adequate to provide sufficient interest earnings. Obviously, you can also change the amount of the set aside that you provide for a specific community so that you can generate the particular amount of income.

The tradeoff there is how much money you have working in a reserve as opposed to really going out and building more projects. Some people have, in fact, suggested that what we can do is dedicate the interest earnings off certain of what we call the direct loans that we make to wealthier, if you will, communities and use those interest earnings to provide the principal subsidy for the disadvantaged communities.

We don't believe that the investment of funds will be a problem. We believe that we can, in fact, develop mechanisms to do that and there would be adequate return on those investments to provide the necessary subsidies. There are some tax questions that come into this which we've looked at and don't believe will be problematic in achieving the intended result.

Mr. APPLGATE. But you do agree that these small and rural communities do need additional assistance to help them?

Ms. AGRISS. Again, we believe that small communities, in many instances, do require special assistance. We would start with technical assistance, zero interest loans, RDA and then to the extent

necessary, the principal subsidy where you can reduce the necessary repayment.

We would not advise that you reduce that repayment to zero. As I indicated in my testimony, communities really are much more cautious about the way they construct their facilities if, in fact, they are responsible for the payment of at least a portion of it. So you could perhaps come up with a number, either write down the principal repayment 75 percent, even 90 percent, but at least leave some amount that the community would be required to repay.

Mr. APPLGATE. Thank you all for your answers.

Mr. Boehlert.

Mr. BOEHLERT. Thank you, Mr. Chairman.

Ms. AGRISS, I really want to welcome you here as a fellow New Yorker because I'm proud of what you're doing. You do an outstanding job.

Tell me a little bit about the principal subsidy program. The Chairman and I are really concerned about the poorest of the poor communities and they just can't come up with two nickels to rub together. How do you determine how much of the principal you would subsidize? Do you have a formula basis in New York? Talk us through that a little bit, if you will.

Ms. AGRISS. In New York, what we currently have is a program that I think many of you know is primarily an SRF that is what we call a leveraged program. We issue bonds in the bond market and loan the proceeds of those bonds to communities at a subsidized interest rate.

However, for poor communities in New York, what we are also able to do is to provide what we call direct loans where we take the capitalization monies, the Federal grants, and the State match and loan some of that directly to municipalities. We can do that currently at zero interest. That's as much as we can do under the current program.

In determining what communities really qualify for zero interest loans, we have developed a mechanism where we look primarily at median household income, compared to the sewer and water fees that are charged in that community, and look at the ratio of those numbers. So those that are below a certain point would qualify for zero interest loans in our program.

We would strongly recommend that a similar type of formula be used in determining what communities are eligible for principal subsidies. We would strongly recommend that you leave to the States the flexibility to determine which communities would qualify because some States have very different needs than others. Median household income might be appropriate in New York; it might be something else elsewhere.

We do believe that the formulas can be developed. One of the benefits of doing that is you may have situations where over time, a community initially could afford only a particular amount as an annual repayment, but if they have an industry come in, some development, they could afford more over the 20-year life of a loan.

You can, under a principal subsidy mechanism, go back and revisit the issue and determine on a periodic basis, after 2 years or 5 years, for instance, what the affordability is and you can adjust that as necessary by the amount of money in a reserve fund.

Mr. BOEHLERT. I know the word flexibility comes up in all of your testimony. I'm one, as a former county executive in beautiful upstate New York, I know how important that is. I know also how important it is that money follow mandates or accompany mandates.

If we give you the flexibility to have the principal subsidy program, which I'm enamored with, I like the concept, how do we have it as objective as possible rather than having it subjective? I think that's important.

Ms. AGRISS. That's an excellent question because one of the concerns is to maintain the integrity of the fund and to make it as efficient as possible. We believe that by having a set formula where we can look at hard, factual information, that you can have an objective system.

The way New York State has worked this in the past is that in our regulations that govern our State Revolving Fund Program, we have included the formulas that we use in making those determinations on zero interest loans. I would encourage the Congress to direct States that if you go ahead with this, those formulas be set in some type of formal basis so that you avoid some of the subjective determinations that otherwise might go on.

Mr. BOEHLERT. One other question. You're well aware of the problem we're having in New York with the watershed in places like Delaware County. Should there be special consideration for communities in an area like Delaware County as we approach this overall problem of the New York City water?

Ms. AGRISS. Again, I think the best way of approaching this is on a need basis, looking at affordability of a project in a community and providing the assistance that is required to make the project affordable, be that through zero interest loans or principal subsidies, or working with the other agencies that I had suggested in my testimony.

In the New York City watershed, there are many, many complex issues. We have been actually working closely with New York City and some of the upstate communities as well on how to use the existing SRFs to make projects more affordable.

There are many things that can be done under existing statute. Some people have said, well, how do you fund a nonpoint source project with a loan. We think there are a lot of ways to do that. It may not be feasible in every instance but we think the States can be very creative in developing ways to use a loan mechanism.

Mr. BOEHLERT. New York State has been exceptionally creative under your leadership and just let me commend you for that.

Ms. AGRISS. Thank you very much.

Mr. BOEHLERT. I look forward to working more with you and my staff, which that's brain power right over here.

Ms. AGRISS. We've met with Gabe and we certainly appreciate your assistance.

Mr. BOEHLERT. One further question if I may, Ms. Savage. As one of the three Republicans in the House who supported the President's economic stimulus program, I can speak with some authority about it. But one of the things that bothers me on that program is moving up to \$845 million from 1994 to 1993 and the matching requirement for the States, the 20 percent match I can understand,

you don't look a gift horse in the mouth, but the fact of the matter is we're going to have fewer projects under construction by waiving that 20 percent than we would if we continued to require it. Have you taken a position on that?

Ms. SAVAGE. We would like to see it waived. When we were asked by the Administration how this would affect the States, and whether or not to move the money forward, we didn't understand at first. We were very happy, we thought \$845 million of new money, hurrray.

Mr. BOEHLERT. It's creative accounting.

Ms. SAVAGE. Yes. Then we saw the charts and in the long term, it wasn't a big hurrray after that. Basically, what the President is suggesting, as we understand it, is to just move 1994 money forward to 1993. To do that and get any kind of work done in the time frame that they are requiring, you couldn't go back to your State legislatures and ask for an additional match. There simply would not be time.

That's why when they asked us, if we were to do this, what would you need out of the way? We said, certainly the States can't go back to the legislatures, many of them have already gone home to ask for additional funding for a State match for \$845 million. So we're supportive of it if, in fact, the \$845 million is going to be there, but the end result is we're asking the States to hurry up to slow down. We're moving \$845 to 1993 and disrupting the program and then going down to \$1.2 for 1994. So, it is \$3.5 million in 1993 down to \$1.2 million and back up to \$2 billion.

Mr. BOEHLERT. That's creative accounting. On one side of the ledger, they're saying we're cutting unnecessary spending and they use that \$845 million reduction for 1994 as an example, which I think is disingenuous at best because that's certainly not unnecessary Federal spending. Then would you suggest we increase the match for 1994 or no?

Ms. SAVAGE. As I understood the waiver of the match, it would be only for the \$845 million stimulus. Definitely for us, we don't want to see it go down to 1.2 because as you well know, watching the budget process, once it goes down there and they give that \$800 million to some other program, it's going to be darned difficult for us to get \$800 million back in our program if not impossible.

Mr. BOEHLERT. Well, we're going to help you.

Ms. SAVAGE. So we appreciate it and we're going to need all the help from this committee we can get.

Of course NGA and ASIWPCA have written to the President saying, please don't take it down to 1.2 because you'll devastate our program.

Mr. APPLEGATE. Thank you, Mr. Boehlert.

\$845 million from 1994 but it was necessary spending, not unnecessary reduction in spending.

Mr. BOEHLERT. Well, I was just observing that this Administration is no different than any other Administration. I'm not being partisan in this respect, but it is creative accounting when you list all the money you're allegedly saving the taxpayers by cutting out unnecessary spending and this \$845 million reduction in fiscal year 1994 is in that category.

When you talk about the stimulus program, you take that same \$845 million on the plus side of the ledger and you say, look what we're doing to stimulate the economy. I think it's disingenuous. Of course it's not unnecessary spending. I think the spending is very necessary for wastewater treatment and like you, I agree that the one should not be reduced in 1994 to 1.2. I'd like to get it up considerably over \$2 billion.

Ms. SAVAGE. So would we.

Mr. BOEHLERT. Thank you.

Mr. APPLGATE. Mr. Menendez.

Mr. MENENDEZ. Thank you, Mr. Chairman.

Several of you have raised the issue of funding and I would like to know if the funding issue has created a situation in which local taxpayers ultimately have to face increased local taxes to make up the shortfall. Are communities who have to comply under the law facing the possibility of sanctions or is that not in play in terms of the funding issue?

Does the low level of funding put any of the municipalities, who have to comply under the law, in the position of choosing between raising dollars on their own from taxpayers and sanctions if they don't move because the local tax bases can't afford it? I'm interested as a former municipal official.

Mr. HEMMER. I believe that's exactly the problem that many of our communities have right now. They are faced with compliance and in facing that compliance under programs much broader than what we're talking about here today, they are faced with trying to come up with those resources. That was exactly the point I was getting at when I said if we're going to pass on the mandate to them, we need to be cognizant of the funding, we need to keep the funding levels up in the programs and we also need to give flexibility such that we can prioritize the limited funding they have towards the greatest risk to the citizens of those communities.

Ms. SAVAGE. Mr. Menendez, under the Clean Water Act, particularly in the beginning, there was a philosophy that if funds were not made available under the grant programs, then compliance could linger. In the mid-1980s, the States and EPA worked together on what is known as the National Municipal Policy. For the first time, the word that was used was, we de-coupled compliance from funding and basically said, you've had almost 20 years now to meet the requirements of the Clean Water Act and thereby, if you don't get a grant or you do get a grant, that's not the big issue here. You've got to meet the requirements of the law.

Since that time, the municipalities have been moving expeditiously forward, and they were in advance of that, to meet the secondary treatment levels that were required by 1972.

So in the eyes of the law and certainly, EPA, whether or not a community is funded or not, is not the issue. They are required to meet secondary treatment levels as required by law.

Mr. MENENDEZ. Which then means that local taxpayers, if their communities are not fortunate enough to receive any assistance from the Federal Government, are paying to meet the federally-enacted statute?

Ms. SAVAGE. That's correct but that's why we wanted to move to the SRF, as Terry indicated, to provide the opportunity to get more

money out to local communities on a very specific, strategic program that States could anticipate year after year instead of having to worry about one year we've got \$5 billion worth of funding and the next year, we have \$2 billion, or exactly what we're seeing in the stimulus. We need a specific stream of funding that is out there and predictable for local governments to build these plants with.

Of course now with a 20-year life under the Clean Water Act, most sewer plants that were built with the early grants are up for rehabilitation and reconstruction. So we're not just looking at those who haven't done what needs to be done, we're looking at a whole new group of folks that did what they were supposed to, but now their sewer plants are outdated. So it's a big field out there that we need to deal with.

Mr. MENENDEZ. And they have to upgrade to meet the standard?

Ms. SAVAGE. Exactly.

Mr. MENENDEZ. In line with that, Mr. Hemmer raised a point on page three, "No one knows the extent of the Nation's NPS pollution problem, there are probably thousands of watersheds requiring similar levels of treatment." Isn't that a call for having some type of inventory or needs assessment survey so that we will know, as we try to fund these programs the number of continuous programs that have a long range funding mechanism so that there will be a steady stream? You say here, "We have too many examples in Wyoming of good projects that failed because they weren't carried to fruition due to the lack of funding."

Mr. HEMMER. You have to assess your watersheds now, so I think you have one tool you can look at in terms of what our status is and where our impaired watersheds are. We've suggested in here that there does need to be a sequencing and an evaluation such that if you have put the plant in place and the plan isn't working, in fact you have to go back and look at the plan again.

I think there also needs to be a priority approach to the watershed such that through that evaluation, you're addressing those in greatest need.

Mr. MENENDEZ. Mr. Slade, in your written testimony, when you talk about clarifying the State water quality standards which are more stringent than Federal requirements—do these apply to the dredging of sediments? For example, at a seaport or a marine port if there is dredging that has to be done in order for ships to come in and to meet its depth, is that part of what you're suggesting take place?

Mr. SLADE. The ports are already complying with State water quality standards, federally-approved State water quality standards. Our problem lies with the Army Corps.

Mr. MENENDEZ. But, it's the Army Corps that issues permits to allow that dredging.

Mr. SLADE. But the Army Corps conducts an awful lot of operation and maintenance dredging by itself to the tune of 800 million to 1 billion cubic yards of dredging. When the Corps issues a permit to a port or to a company or an individual entity, all of them would have to comply with federally-approved State water quality standards before the Corps could issue that permit. When the Corps does its own operation and maintenance dredging, it's in its 1988 regulations, it sets a Federal standard and that Federal

standard is the least costly, environmentally-acceptable manner for conducting this dredging.

That is also a budget vehicle. What the Federal standard is for any dredging project is how much the Corps allocates of its budget to do that. What the Corps has been doing is not incorporating federally-approved, State water quality standards that are more stringent than a federal standard that EPA has promulgated alone.

So if a State's federally-approved water quality standard is more stringent, it's not incorporated into the Army Corps Federal standard and the Corps says, State, you have to pay for that.

Mr. MENENDEZ. I'm confused. Give me a definition of what their own projects means.

Mr. SLADE. The Army Corps does an awful lot of dredging.

Mr. MENENDEZ. Themselves?

Mr. SLADE. Themselves.

Mr. MENENDEZ. Of what?

Mr. SLADE. Of ports and navigation channels. They dredge about a billion cubic yards a year and they are not issuing themselves a permit. The Corps doesn't issue the Corps a permit; the Corps just goes and dredges under its own regulations. It's those regulations which do not incorporate the water quality standards federally-approved by EPA that the States have set through the Clean Water Act.

Mr. MENENDEZ. Thank you, Mr. Chairman.

I have some other questions I'd like to submit to the panel.

Mr. APPLGATE. You may do that and they have agreed to answer additional questions that we will submit to them.

Mr. Gilchrest.

Mr. GILCHREST. Thank you, Mr. Chairman.

Ms. Agriss, could you give us a copy of the principal subsidy proposal? Is it written down in policy form?

Ms. AGRISS. Certainly. We can provide that to the committee. I'd be happy to do that.

Mr. GILCHREST. It sounds fascinating. I think it's something that we ought to closely consider to be incorporated into the Act. I have communities in my district with whole towns that have failing septic systems and they must comply with State regulations, but they have no money to fix them.

Ms. Savage, I think you were referring to nonpoint source pollution when you said we should push for voluntary compliance first in that particular area. I agree with that, but suppose the voluntary compliance isn't working, is there a suggestion that you have for some mechanism or some criteria upon which they would then be subject to a mandate?

I don't necessarily agree with this, but the Federal Government, in order to get compliance from some States as far as highway speed or when someone should be allowed to legally drink, you get highway transportation funds dependent upon if you raise the drinking age from 18 to 21 and the States have that. It's called voluntary compliance but there's a little hammer behind the carrot approach.

Is there something you have in mind for voluntary compliance with nonpoint source pollution?

Ms. SAVAGE. The position of the States has always been that a voluntary program for nonpoint source is the appropriate direction for us to take, but as we've looked at developing watershed protection programs as the concept of trading between point and nonpoint has been discussed as we do in the air program, we realize that it all comes back to the point source discharger because if farmers do not do what they are supposed to in a negotiated watershed protection program, who are you going to hold accountable in a trading situation? The farmer doesn't have a permit, there's nothing legally binding, so you have to come back to the entity that does have a permit and hold them accountable.

That doesn't seem fair in the long term when we keep saying that anywhere from 50 to 80 percent of our problems that remain are of the nonpoint type. So our association just this year has developed a more extensive program that says, voluntary education development programs should be the first line of defense, but after a period of time, if in fact that entity—that farmer or that community—is not doing the kind of nonpoint source controls to ring in the water quality to a level of acceptability, then we need to look at a more formal regulatory program with mandates. I would be pleased, sir, to share that with you.

I am concerned though about the philosophy of holding money hostage in one program for another. We did that in the air program—if you don't do A, B and C, we're going to hold up your sewer money. Well, good, then we have dirty water and dirty air. That makes absolutely no sense.

So, yes, there should be other ways of sanctioning but diminishing and degrading two environmental programs for the price of one makes no sense to me.

Mr. GILCREST. I guess in the voluntary approach, which I also agree with, in order for a farmer to comply with the established best management practices, then there needs to be some incentive for him to do that or there has to be some funding in order for him to comply with the regulations?

Ms. SAVAGE. Exactly. That's why, as Terry indicated, the States are promoting expanded use of nonpoint source programs within the body of the State Revolving Loan Fund and to have the flexibility, as they do in Wyoming. If you don't have a lot of sewer plants to build, but you've got a lot of nonpoint source problems, then put your money there within the context of the SRF.

We'd like to work with the committee to make sure that we can develop a strategy that makes sense and a program that we can work where these guys who have to make these decisions every day can put their money where the most important water quality problems are.

Thank you very much for meeting with our president when he was in and testified last in Merchant Marine and Fisheries Committee. We appreciate your taking time.

Mr. GILCREST. You're welcome.

Mr. Slade, I'm not sure if I caught what you said exactly but you made some mention that when you have coastal zone management programs to develop and estuary programs to develop that it always cost the State some money. I thought I heard you say that

a management plan should be eligible for SRF funding. Was that correct?

Mr. SLADE. Yes.

Mr. GILCREST. Who would get the funding for developing a plan such as that through the State?

Mr. SLADE. The management plans are to be implemented both at the State and local level. It would vary.

Mr. GILCREST. So a community that was right on the bay, or a community that was right on the ocean that was mandated through some measure by the State to comply with State regulations, thereby, they would have to come up with their own particular management plan which might cost a great deal of money. That municipality or town would be eligible for an State Revolving Loan Fund to pay an engineer to come up with the plan?

Mr. SLADE. No, the plans are already developed and approved. What we're saying is, once they are approved—let me back up. Under the former Administrations, the U.S. EPA would not allow any of the available money for the implementation of the plan. The plans are management plans; they are not mandatory to develop. This is a voluntary program, but once they are approved, once they're developed and have been approved, then the former Administration, through the U.S. EPA, prohibited any Federal money for the implementation of them. The implementation fell on the budgetary shoulders of the States and local governments.

Those shoulders are pretty narrow these days and what we are saying is one idea is perhaps making State and local governments eligible for funding the implementation of those plans through the SRF.

Mr. GILCREST. I thank Mr. Slade for his suggestion on implementation of the management plan which sounds right on target with what we ought to do. You made mention in your testimony that the EPA, being the final arbiter in allowing a permit to go through for a wetlands permit, should be optional under certain conditions. I think I have that correct. In other words, the State should have more say in issuing the permits, which I think is correct. I guess someday that is going to be a possibility for the States to be able to do that.

You also mentioned in your testimony that education has to come first. It's been my experience that an awful lot of people, even State officials, believe it or not, don't have all of the broad understanding of the importance of the use of wetlands. Should they be solely responsible for issuing those permits without any EPA oversight? I'd just like you to comment on that.

Mr. HEMMER. Mr. Gilcrest, I think the States have a lot of abilities for the wetlands program and for taking it over. Our position is that what we ought to get into is a situation where you do delegate the wetlands program to the States and then you have an EPA oversight in your annual review just like you do in many other programs.

I think one of the things the States need is the ability to be more active and I think also, as you go through wetlands, the other thing you can provide all parties to help them a lot is a concise wetlands approach for all agencies. One of the problems you have right now with wetlands is you have a whole bunch of vehicles that address

wetlands and they have differing definitions, differing approaches. Consequently, as we get into trying to work through that, particularly in our instance in Wyoming of trying to develop the Mitigation Bank, it's very difficult when you're going different ways.

I think to the extent that you can put wetlands in one place, that would be very beneficial and then I think to the extent you can put it in place such that the States can take it over with the correct framework and implement the plan as it benefits their wetlands, would be very beneficial.

Mr. GILCHREST. I think putting it that way, you're again very accurate.

I also appreciated the fact that I think everybody up there made the recommendation that wetlands, and all of the issues that we're dealing with, stormwater and point pollution, be dealt with by using in a scientific method, not a political manner.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Gilchrest.

Mr. Poshard.

Mr. POSHARD. Thank you, Mr. Chairman.

The previous gentleman just basically articulated one of the concerns that I have. I represent a large, rural area that is bounded on both sides by the Ohio and Mississippi Rivers. We have a lot of wetlands problems in the lowlands surrounding those rivers, but we have a lot all through the agricultural area that I represent.

I think you're right, Mr. Hemmer, in that the States have an appreciation for the value of wetlands. I think they recognize true wetlands as the kidneys of this country in the value they perform for us. It's the maze of jurisdictional authorities that we just cannot wade through. Every day, it's one problem after another—the Corps permitting fee, EPA oversight, the Fish and Wildlife commenting which usually throws everything into a tizzy because then the environmentalists pick up on that and they file suits and this just goes on and on.

It's not that either side is right or wrong, it's just that you can't wade through the maze to ever get to an actual solution to the problem. So I guess the question that I would ask you is whether the Governors have expressed an opinion on this: if you had your choice at the Federal level, which agency ought to have sole consideration of this issue, and second, do the Governors support the idea of a scientific study to try to resolve this question of what a real wetland really is and what should be protected and what should be let go with regard to this jurisdictional situation?

Mr. HEMMER. If I could start with the last one first, the Governors very strongly support a scientific component where you go with wetlands is such that we get into science-based wetlands of how we approach and protect those valuable pieces. I don't believe that the Governors have taken a position on which agency should do it. From my own perspective, it's less important which agency does it than that one agency does it.

Mr. POSHARD. Ms. Savage, if I can ask you a question. One of the largest communities I represent in my district has a nonpoint source pollution problem in their city lake. It may be the runoff from farm chemicals, I don't know. It's in the middle of a large agricultural area.

Only for a few days during the year do they exceed the compliance standard for nitrate level in the lake, but that community right now is facing—because of EPA standards—maybe a \$25 million facility that they're going to have to build to treat the nitrates in the lake. They are trying to access monies for a study to see where the nitrates are coming from in terms of nonpoint.

Are we a little too strict here? I can understand if the nitrate level is excessive 365 days of the year or even 50 days of the year, but what if it's only excessive 10 days of the year or 20 days of the year? Are we grappling with some standards there somewhere to try to bring some balance to this thing or what are we doing? What should we do?

Ms. SAVAGE. Well, sir, one of the things I learned very early in my career was not to second-guess a member of my association in public. That's perhaps why I have some longevity, especially without the information to make some judgments about why they would have come down on the position they did.

If you would like, I will go back to the member in your State and ask why they developed the position and are taking the enforcement mode that they are and get back with you on it, but it's not a good idea to talk when you don't have the facts.

Mr. POSHARD. Let's talk about it individually. Can you contact my office then and we'll share some information on the particulars of that. I'd just like to get some opinions.

Ms. SAVAGE. Absolutely. We'll do that, sir.

Mr. POSHARD. Thank you.

Mr. APPLGATE. Thank you, Mr. Poshard.

Mr. Horn.

Mr. HORN. Thank you very much, Mr. Chairman.

Let me ask a question to all of you since you're grappling with these problems at the grassroots and most members of the committee appreciate that, that you're living on the firing line. You've now heard all the comments and basic thrust of your colleagues that appeared today, are there any points where you disagree as local administrators with what you've heard concerning the Governors' view, local administrators' view that you'd want the committee to understand your perspective? Does anything come to mind or are you all in agreement, as you see it?

Mr. HEMMER. I'm not aware of anything that the other members have said that I'm in disagreement with.

Ms. SAVAGE. It's not by accident, sir, that our testimonies are very consistent. It's also not a good idea to be inconsistent with the Governors. We work very hard 365 days a year to develop our positions as State administrators, as representatives of the Governors and the financial associations to make sure that we work well together. So before we come here, we do a lot of work to make sure that we are consistent.

The only thing that I would suggest is within the CZMA, again, we do have some concerns that taking that legislation and wholesale putting it into the Clean Water Act at this point is a little early to make that judgment, but that would be the only issue I would take even the smallest concern with.

Mr. HORN. Okay. Any other comments?

Mr. SLADE. Yes. I think you focused on what I was nervous about coming here this morning, whether we would sit up here and disagree. I've been pleasantly surprised that we haven't. The Coastal States Organization does work very closely with both ASIWPCA and NGA. I know that we independently developed this testimony.

What I heard, if I may venture out here, was three points of agreement. One, we need better coordination between Federal programs that are existing now. We have lots of Federal programs that are out there being independent and doing their own thing. We don't have the money for that luxury anymore. I don't care about Federal agency turf battles. I couldn't care less. I want them to get together, I want their science, I want their technical assistance coordinated. I think that point would be shared.

The second thing is we need to best utilize the scarce Federal dollars. I don't think there is any argument with that.

The third point I think you heard from at least the three of us on this end of the table was whether it's voluntary or mandatory programs, give the States the maximum amount of flexibility to address these problems locally. Combined sewer overflow problems in Alaska are not the same as combined sewer overflow problems in Florida. Louisiana wetlands are different than New Jersey wetlands.

Mr. HORN. Very good.

Ms. AGRISS. I would simply add that we do work closely together but we also have strong beliefs in what we're agreeing to. The States do feel that you have developed a mechanism through the State Revolving Fund that really is working exceptionally well. We applaud Congress for having the foresight to have implemented that.

I think where you may hear some disagreement unfortunately is your hearings tomorrow.

Mr. HORN. Ms. Savage, I have one question on which I need clarification on your watershed pollution comment where you said you think they can be best dealt with at the State level. When you have a watershed that overlaps State boundaries, is your thinking that the States involved would enter into a special compact for coordination and management of that watershed or how do you see handling the situation that goes beyond the State boundary?

Ms. SAVAGE. More than half of the States currently have interstate commissions and compacts. For example, here it's the Potomac Interstate Commission where the States of Pennsylvania, Maryland, D.C. and Virginia work regularly on the Potomac watershed and parts of the Chesapeake Bay. So in many States, those mechanisms already exist.

In areas, Wyoming would be one, where an interstate compact necessarily doesn't exist, there are organizations that do exist where States can get together. Ours is one. The point of our association is to bring the States together to build commonalities between the way they manage their programs.

Within the 1972 law, there were calls for conferences between States that had differing positions on water quality standards and so on. So mechanisms exist. We don't have to create a new one.

Interstate issues arise all the time that have to be dealt with and they are dealt with. In some instances, it's loud yelling in the back room, but they come out of the room and they get their jobs done.

Mr. HORN. Thank you.

Let me just make one last comment. Mr. Slade, I enjoyed your comment that we need sound science, not political science. Now, I am a political scientist by profession, so I assume you did not mean the profession.

I am reminded in your comment on science that when my daughter was one year old, she was asked, what did her daddy do and she put her hands on her hips and said, he's a pitiful scientist. [Laughter.]

I think what we're talking about is pitiful science not being in some of these debates, but the problem what gets admitted in court. Indeed, the Supreme Court is grappling with that, perhaps has grappled and I just haven't read the opinion.

Do you have any words of wisdom when you've got these competing expert witnesses that say one thing and the other, and never the two do meet?

Mr. SLADE. Sometimes I don't think the scientists are anymore cohesive than political scientists. One detail that I could put on the record is that the National Academy of Science is in charge of developing a study which has gone underfunded, if not unfunded. The NAS study is supposed to be out December of this year and because of lack of funding, I don't think that's going to happen.

We are all fairly eagerly awaiting the National Academy of Science's report which hopefully will be based on science as to the wetlands issues.

You mentioned the courts wrestling with this and I know Mr. Hemmer touched upon this in his testimony and we agree with it. That is legislation, congressional legislation shouldn't define statutorily what is or is not a taking. We think for better or worse, that is a constitutional question, both the Federal and State Constitutions to be determined in court. We need an awful lot more flexibility there. That's just a flat out legal approach to which branch of the Federal Government should be determining what is or is not a taking in violation of the 1st or 14th Amendment. Again, I say for better or worse, that is more properly the role of the courts.

Mr. HORN. Thank you, witnesses. I think you've all given splendid testimony.

Thank you, Mr. Chairman.

Mr. APPLEGATE. Thank you, Mr. Horn.

Chairman Mineta.

The CHAIR. I apologize for not being here for the time of all the testimony but I'd like to ask Mr. Hemmer a question. Mr. Hemmer, in your testimony you're talking about the SRF as it relates to the Water Treatment Program to be expanded into an SRF for the clean drinking water issues. I'm wondering in that regard, how do you think we can best maximize, or how would you structure it so we can maximize the ability to get a good program if we go the approach of the SRF on the clean drinking water issue, given the existing structure for SRF on the wastewater treatment side?

Mr. HEMMER. Mr. Mineta, my suggestion would be quite simple, add funding to it and expand the breadth for which it can be used

to include drinking water and simply allow the State to use that funding mechanism to cover either one of them.

The CHAIR. Would States be able to utilize the same funding mechanism whether it's for clean water purposes or safe drinking water purposes?

Mr. HEMMER. I'm unaware of any impediment to doing that. It seems to me the SRF works well for wastewater and it should work similarly well for drinking water.

The CHAIR. Ms. Agriss.

Ms. AGRISS. I think it's a very interesting question. One of the things that the committee may want to consider is that there really is in many instances a fuzzy line between what is a wastewater project and what is a drinking water project. Recently, EPA came out with an advisory that allows us, for instance, to fund under the existing SRF's, the treatment of sludges from water treatment facilities or backwash from those facilities on a standalone basis. That could either qualify as a water project or wastewater project. Similarly, many nonpoint source projects might come under either wastewater or drinking water.

So you have a kind of fuzzy situation in those cases. ASIWPCA very strongly feels that by combining the two programs you will have a much stronger program at the end and that it is perhaps a little complex. You may want to continue having separate appropriations in order to preserve the likelihood that we will get adequate funding for both types of activities but that the monies ought to be able to be combined in a single fund for those States that are leveraging their program to maximize the benefit of the Federal contribution.

We feel very strongly that the credit benefits of combining the two funds are really extraordinary.

The CHAIR. Robbi.

Ms. SAVAGE. One of the concerns that we would have is the undermining of the current SRF under clean water by simply plopping something into clean water without really thinking it through. I understand, as you're going through your negotiations on the stimulus package, you have three options: one, using the appropriations process; another the budget process, and legislation through authorization.

These issues are very complicated and I would be very concerned if the appropriations process were the vehicle you use to the exclusion of those of you who are on the authorizing committees. We would of course see the jurisdiction decrying political science the whole time, but the bottom line is there are jurisdictional issues here and certainly in the States. In the Drinking Water Program, some of the programs are not handled in the environmental agency but in the health department.

So to simply put some money in there and expect it to happen overnight is not a realistic expectation. I think it demands some very close evaluation on how to most specifically and efficiently connect the Clean Water and Drinking Water Programs and what we want to accomplish in doing that. Do we want to mix the two of them in totality or just the funding programs or what are we trying to accomplish here, just getting the money out in a short period of time?

If we do want to bring them together, then very surgically and specifically, we should design our programs to be efficient at the State and Federal levels. Otherwise, I can see the two programs which are both designed for the betterment of water resources throughout the country being at odds with one another on Capitol Hill, at EPA and certainly within State and local governments. That's really the last thing we need at this juncture.

I would hope that all of you maintain jurisdiction as best we all can and stay within the discussion because it's not going to be an easy task. We appreciate your leadership in this area.

The CHAIR. If EPA submits legislation, I hope it is, frankly, as an amendment to the Clean Water Act to establish the SRF. Then it will be in our jurisdiction. If the SRF is established as an amendment to the Safe Drinking Water Act, then we probably would not have any jurisdiction. That's going to be a point of discussion that I'm going to have with the Administrator of the EPA before she submits.

Ms. SAVAGE. I wouldn't want to be in her shoes.

The CHAIR. So whatever help you can provide on that to everyone, I'd appreciate it.

While I've got a couple of minutes left here, let me ask you, in your testimony, you oppose the idea of mixing a grant program with a loan program in the SRF. I'm wondering if you could expand on why you take that position? In particular, it seems to me we like to talk about the kinds of multiple benefits that we get from the SRF mechanism, basically because it's a loan program and the SRF is constantly recycling. How would adding a grant program to the SRF affect those multiples?

Ms. SAVAGE. We're in opposition to the recreation of a wholesale construction grants program. Even though I know the Administration is going to be asking for \$100 million to do this very thing, we don't think that's a good idea and it's the States' position through the ASIWPCA and CIFA and through the National Governors Association that this is the wrong direction in which to go.

The reason for that is that we worked very hard at your direction to create SRF's. All 50 States have them and they are working well. For a community that sees the opportunity for a grant, why would they want to take out a loan if they can wait and get the money? That's only good fiscal management if you happen to be a local government official.

Within the context of the State Revolving Loan Fund, we would support small community, a hardship community, depending on what the definition is, particularly as outlined by Terry and CIFA in the principal subsidies. That is a direction where we can help small communities do what they need to do.

I think the real contentious issue here is the Boston, New York Cities, the San Diegos and the Puget Sounds, who are very large communities. Other communities would argue that they had their opportunity to meet secondary treatment levels, for whatever million reasons, did not. And, should they either be rewarded for not doing that by getting more tax dollars to do the work that perhaps they could have done and should have done in other times, or should they have to figure out how to do it? It's a very, very difficult problem to be in.

Massachusetts is where I was born and it's a very tough situation for those people. The rates are outrageous. I understand that, but some decisions were made back in the early 1970's that brought them here. A lot of communities that moved forward and met the requirements of the Clean Water Act don't take kindly to very large grants to communities that, as I said, for one of the million reasons did not follow suit.

The CHAIR. Is there a way to have a threshold level there maybe? As you say later in your testimony, "Small communities need help." Is there a way that, by having a threshold level, small communities can get help through a grant program and the larger communities or combined plants through joint powers agreements would not be eligible for because they are what you might refer to as super treatment plants? They would not be eligible for those plants, whereas local, smaller communities, smaller treatment plants would be eligible under a grant program?

Ms. SAVAGE. I think that's very possible. In her testimony, Terry outlined the principal subsidies program that we support. Just as a suggestion, we can give you some language on that, Mr. Mineta on how we might be able to do that. There is an \$800 million gap in fiscal year 1994. Maybe that's the place to put \$800 million to address the small and hardship communities if we can develop a principal subsidies program to do that in a very short period of time.

There's no debate within the water community that these small communities need help. The New York program of self-help is very creative and it's a wonderful way to deal with this. We have to find the money to help small communities without destroying the corpus of the fund. That's our real concern. We need this money to build plants in perpetuity. If we start giving out grants, we're going to undermine the corpus and dwindle the money away. Ten years from now, you're going to haul us back and say, why did you screw up the program.

We want to make sure we keep that corpus in tact and the principal subsidies that Terry outlined is a way of doing that for small communities that we very much support.

The CHAIR. One of the big problems I had in trying to push for extra funds in the economic stimulus program, whether it was transit, highways, water pollution, whatever program it was, is there the capacity to handle this amount of money, whatever it might be by the agencies to do whatever—highway repair, transit programs, water pollution control?

I'd always get this response, well, we don't know whether the States are ready to go, so we had to put these 90-day provisions into the highway program, yet projects are ready to go within a certain period of time.

It seems to me given the needs that exist, we can point to \$100 billion needs in x number of years, 20 years, if we even increase this, if we are able to, say up to \$5 billion in terms of the SRF Program, are we going to be able to absorb the \$5 billion per year in an SRF program, are the States going to be able to handle that?

Ms. SAVAGE. As you know, the spend down on the construction of wastewater treatment facilities takes a number of years. On the other hand, at the request of Mr. Baucus, ASIWPCA did do a sur-

vey of the States. If money goes into the stimulus package, how much can we use and how fast can we get it out. We were able to document \$10 billion of immediately needed projects that can go through the pipeline. The concern, of course, that we have is that the expectation then is jobs, not only getting those sewer plants going but how many jobs are attendant to those?

We've been talking very consistently with the agency, with EPA. The day when this is signed, you guys will have to do your job so the States can do their jobs, so the local governments get that money out there. Through this entire exercise, that may be the one thing that will be worthwhile, forcing us to streamline this program to get the money out.

Yes, we're in a position to use it, we're in a position to use it wisely. Had we gotten \$5 billion in a stimulus package, we would have had to do a lot of scurrying. In an authorized amount where we can plan effectively for a long-term program, there is no question we can use the money. If it's \$5 billion one year and \$2 billion the next, and half a billion the next, then you've got a stop and start situation and that's inconsistent with doing effective management. If you want to go to \$5 billion, we can certainly support that without any question.

Of course that's our position, the Governor's position and CIFA's. So we can do it.

The CHAIR. We want to make sure that there is some kind of stability in there and we don't get the peaks and valleys in terms of the appropriations process.

I think also in regard to this, are we going to make sure that States are able to do priority projects and not get into exotic things.

Ms. SAVAGE. We know that our collective backsides are on the line for this. The President managed a clean water program through his executive branch agency, he knows about the clean water program. I chatted with him when he was a Governor about SRFs, so he understands the program. There is no question about that and he's going to hold us accountable. So the States are very much aware that we've got a lot on the line, as EPA is. So, yes, we're going to be able to do this.

The CHAIR. One final question. Expand, if you might, on this unnecessary oversight problem that you're referring to?

Ms. SAVAGE. You want me to be specific about the oversight. We have a tremendous amount of reporting, there's the governor's 20 percent set aside that you worked with Governor Matheson and I to put in several years ago. Those restrictions simply shouldn't apply any longer. It's not a grant program anymore, it's a loan program. To have all those Federal strings on this money when, in fact, these communities are taking loans. They are not being given money, they should be able to design the programs the way they see fit as long as they do the job and meet clean water requirements.

We have a whole laundry list of things that we would like to see out of the Clean Water Act under Title II and the crosscutters, historic preservation being one of them and other social goals that are crosscutters as well. There are 28 of them, as you know, and we need to be able to look at where we can streamline the management of the program.

EPA doesn't have the people to do it, the States don't have the people to manage it, so there are a lot of ways we could make the program more efficient. Perhaps, since he manages one of them, Dennis would like to give some specific suggestions.

Mr. HEMMER. Mr. Mineta, I think Robbi has very articulately touched on some of those issues. We have many requirements that in and of themselves are very laudable, but simply don't apply to many of the plants that we are building and we are spending money going through those reviews anyway.

I think to the extent you can get it to an applicable arrangement, you can save both parties a lot of frustration and money.

Ms. AGRISS. I would just add in terms of a specific, we are an environmental agency. New York State has a strong environmental review process of its own. EPA requires that we have a duplicative NEPA-like process that can add months to our approval of a project to go forward for SRF financing. So we think there are any number of crosscutters as Robbi has suggested that really could be foregone. You would not reduce the environmental protection or other social goals that you have, but we would get projects built faster.

The CHAIR. Let me ask on that, is there a way to make whatever your State requirements are and the NEPA requirements concurrent rather than sequential or are there problems with your State requirements?

Ms. AGRISS. They are somewhat divergent requirements. The level of review that is required is greater under the Federal requirement in terms of which level of government frankly does the review. It means that there are more people that have to do the same work and we think it's actually duplicative and could be streamlined.

The CHAIR. If the State is certified to be eligible to work the problem, why would there be the divergence?

Ms. AGRISS. The difference here is EPA has required us to do what is called a NEPA-like review which they require to be done by the State's environmental department as opposed to under State law, a local government can go through the entire process on its own. So we now need both local government to do the environmental review and have it essentially redone at the State level.

The CHAIR. Very well. Thank you very, very much. I appreciate it.

Mr. APPLGATE. I thank the Chairman.

Last but not least, Mr. Hamburg.

Mr. HAMBURG. Thank you, Mr. Chairman.

I really appreciate your holding these hearings. The more we talk about the reauthorization of this act, slowly some of the information that I need to have at my command is seeping in, so I hope to become both more knowledgeable and better able to work with all these issues that the panelists have talked about so well this morning.

Part of being sort of one of the lower folks on the totem pole is that you not only have to be patient, but you have to be prepared to have most of your questions preempted by previous questioners.

One of the things I was glad to hear, and I really identify with Congressman Boehlert on this, is the issue of funding for small communities. I represent a large rural district with lots of small

towns in upstate California. Mr. Boehlert represents upstate New York. We have a lot of problems in common with respect to small communities that didn't get on-line with early programs and now are faced with large fines and penalties for not meeting standards which they don't have the money to meet. So I was very glad to hear the discussion about various ways that we can use RDA, use HUD, use principal subsidies. I think all that information is very useful.

The question I want to ask is something that hasn't come up this morning and I'm not sure if it's come up at other hearings or is it something we're going to talk about more in the future, which is the whole area of INA, innovative and alternative systems.

This is something that I don't know a lot about but having been a county supervisor on the north coast of California and dealing with issues of rebuilding sewer plant infrastructure, there were two towns in my county that took radically different approaches to dealing with their wastewater treatment needs.

The town of Ukiah, which is the town I actually come from, built sort of the high energy use, high tech, lots of expensive engineering, lots of concrete, a wonderful treatment plant that was a great job but it cost about three times more than the one built in the community of Arcadia which also dealt with their wastewater treatment needs but used a marsh system and used a whole different kind of treatment scheme and also met the requirements.

I guess what I'm wondering is, since the dollars are so scarce to deal with the problems of the communities, are we really using the systems that are the cheapest and perhaps also the ones that use less energy, and can spread the dollars out further if we use these more innovative technologies. I don't know who to ask about this. If any of you feel especially qualified, just jump in.

Ms. AGRISS. In New York, as I indicated in my testimony, we have a program that's called the Self Help Program. It was started with the assistance of Rensselaer Institute which is nonprofit. It is designed to provide technical assistance to small communities.

Through it, what we do is really provide an intensive hand-holding effort to a community to look at what is the level of technology necessary to solve the community's problem and we can bring some expertise and a significant amount of experience to looking at a community's situation.

We have been able, in many instances, to really significantly reduce the cost of construction of the project as well as the ongoing operation and maintenance cost by using lower tech solutions to that. I think as many of us have suggested this morning, technical assistance to small communities in particular, is very important so that you can assist those communities and develop the appropriate solution to their problems at the most cost effective cost.

Mr. HEMMER. I'd like to add that I think you've also made a very good argument for the SRF approach in that when you have to pay it back, you're going to look much more cautiously at the life cycle cost of that entire operation, both operation and front end, than you will when it's a grant.

Ms. SAVAGE. It sounds, Mr. Hamburg, that you've been talking to Mr. Claussen who we always called the king of innovative/alternative when he was representing California.

There are some concerns with the whole program. Not every State creates at the same level of a California or a New York. Having lived in California my whole young life, I know there is a lot of opportunity for creativity and a lot of ways to solve our environmental problems, but you can't mandate every State, every organization and every local government be equally creative.

The problems that we had with the IA set aside in the past is that, if in fact it was not utilized for IA projects, then the monies went back. It was set aside specifically to do IA, and if you didn't do that, and couldn't be universally creative, then the money went back to be redistributed to other States. That caused us, as a group, a significant problem.

Other communities would try things, even sometimes technologies that weren't very effective, and they knew it, because it was 100 percent funding of IA. If it failed, it failed and there you were. Now we'll go back and get our 75 percent grant.

So in developing IA, it's very important that we push technology and we be as creative as possible, use wetlands as drainage when we can, and so on, but to mandate that everybody in this country be equally creative is just unrealistic and then to punish them for not being creative by taking their money away when we all have clean water needs. So I hope we are not talking about going back to what we had in the IA program in the past.

Mr. HAMBURG. In terms of IA, I guess my prejudice is from watching this process unfold in my home town of Ukiah was that because these more innovative systems were seen as a little bit outside the pale, there was not the willingness to try, there was not the willingness to actually follow models that had proved successful in other communities.

It seems as if the way these systems had always been built and the way the engineers wanted to move them and the way the large construction companies wanted to see them built, seemed to kind of take precedence over the idea of being a little more creative, spending a little less money and doing something that would have served the needs of the community.

As I said, there were these two communities almost exactly the same size. One community spent three times more to develop a fairly comparable system. I'm not talking here about technologies that are untried. What I'm hoping is that through your various organizations and through the Federal and State governmental entities that are concerned with this, we not be afraid to buck the interest that would like us to go a certain direction on these projects, that we not get stuck in old patterns and old ways of doing things when there are new technologies that are biologically sound, chemically sound and much cheaper and can make these funds go further.

I don't know if that matches up with any of your experience. I don't think I'm proposing here that we fund with government grants a lot of outlandish schemes.

Ms. SAVAGE. I'm stepping over my bounds here, but I'll do this to my colleague anyway. Terry has really done a good job with her Self-Help Program and she's got that written out. The community comes together and solves their problem, they decide what kind of a plant they need and if somebody has a bulldozer down the street,

they bring it down and they do a lot of community service work. So maybe, Terry, you could share that with one of our newest members of the committee.

Ms. AGRISS. Surely. I'd be happy to.

The concept of self help, as I said, is really intensive technical assistance. As Robbi notes, one of the things we try and do is look at the abilities within a community itself. If the highway department has some assistance they can provide through either heavy equipment, perhaps digging trenches, that you use what's already in the community. It can be something that's enormously helpful.

It's something that we've talked to EPA about. It is currently funded under the administrative allowance in the SRF Program, part of the 4 percent that we're allowed to use for administration. It's one of those things that we have suggested strongly to EPA that they provide information on how this program works to other States.

CIFFA has been assisting EPA in some training courses in the last few years and are looking forward to continuing that. That is one of those areas we think can really be helpful.

The SRF programs are still new and there is an awful lot the States can learn from one another. I think we've been doing that well so far. At our training conference last year, we had 47 States participating, but there is more that can be done. I think to the extent that EPA can be encouraged to provide the kind of information to all of the States on these self-help programs, it would be enormously beneficial.

Also, I think the bottom line of a lot of this is what Robbi stated earlier, which is because these are loan programs, small communities do have to make a repayment and they do look much more carefully at what their costs are going to be. So it is absolutely in their interests to look at how can I be most cost effective in designing a project.

I think the point you bring up regarding some of the consulting engineering firms that they have been doing things a certain way for years and will continue to do that is an indication that there's an awful lot of education that needs to take place. I think we all need to try and do that education.

Mr. HAMBURG. I'm just hoping some of that education will come from you folks because I think too many times we just think there's one way of doing things. In my town of Ukiah, the engineers were able to convince the city council and the board of supervisors there was only one way to deal with these problems and meanwhile, 100 miles up the road, they're dealing with them in a radically different way, solving their problems, spending a third of the money, and making our resources go further and probably treading more lightly on the environment.

Thank you.

Mr. APPLGATE. Thank you, Mr. Hamburg.

Just one final comment. I just wanted to ask a question of Ms. Agriss and also Mr. Slade who said that he was more interested in science, science than political science.

In the real world, and you're sitting in the greatest political arena in the world and we have no scientists here, we're all politicians. The real world is that there will be political decisions made

that may be or may not be fortunate, I don't know. There are political jurisdictions which have to be considered. We hope that we can do the job that we are paid to do and do the job that is required and mandated by the people of this country. That is to give them what it is that they want and that is clean water, whether it's drinking water or any other.

I wanted to ask Ms. Agriss, it's somewhat of an intriguing idea, that doesn't mean that I am giving it my support, but I do believe that small communities should be assisted through some kind of a program, whether it be a grant program either as a set aside or through what your own formula is.

How much money is in the New York Fund?

Ms. AGRISS. There are a couple of ways of looking at it. So far we have made \$1.2 billion worth of loans, we've made loans to over 70 communities. The size of the Federal grants so far to New York State is approximately \$600 million. That's met with approximately \$120 million State match.

Mr. APPLGATE. So you could draw a pretty sizable amount of money on investment so that you could create a set aside type of program to help these small communities?

Ms. AGRISS. Yes, we could. One of the things that because of New York's characteristics, we have made \$1.2 billion worth of loans but practically one-third of the loans we've made have been to very small communities where they have been under our direct loan program, not our leveraged loan program, which is really for the larger and more financially capable communities.

Mr. APPLGATE. The idea is good. The only thing I have a problem with is how would that kind of a program reflect back to say West Virginia, who has not much of a fund and probably a disproportionate share of communities who are in dire need of some kind of assistance?

Ms. AGRISS. There are a number of States that are in the situation of being primarily rural and having a very significant number of poor communities. We've worked closely with Louisiana, for instance, that is similar, I suppose to West Virginia, to that extent.

We believe that there is a great deal of ability in those States through the financing entities that already exist there. So they could establish exactly the same kind of program that we were talking about this morning with the principal subsidy. Many States have used the existing financing arms of their government to make the SRF loans, so it's either through a State Treasurer's office or something of that sort.

We have worked with people in Kentucky, we've worked with people in Louisiana, as I noted, and other rural States. We think Wyoming has a great program. It's really very innovative. So there is, notwithstanding the differences in the individual characteristics of the States, there is an awful lot we can learn from one another. While the size of the funds may be smaller, the needs are frequently also smaller, although perhaps smaller in monetary terms, although no less complex in terms of the technical issues that are raised.

We believe there is an awful lot of expertise out there in the financing arms of the States and that they can run these programs very effectively.

Mr. APPLEGATE. I thank you very much. We certainly will be exploring that as an approach that I think has a lot of merit. I appreciate all of you coming in today. You were excellent, excellent witnesses. You didn't hold back, you were right there with your answers and we appreciate that very much.

Thank you very much.

Next, we'll have our last panel which is Water Quality 2000, Mr. Paul Woodruff. He will be accompanied by Robert Adler, Kenneth Kirk, Ernest Shae, and Kathryn DeLacy.

Mr. Woodruff.

**TESTIMONY OF PAUL H. WOODRUFF, P.E., PRESIDENT AND CEO, ENVIRONMENTAL RESOURCES MANAGEMENT, AND CHAIRMAN, WATER QUALITY 2000 STEERING COMMITTEE, ACCOMPANIED BY ROBERT ADLER, SENIOR ATTORNEY, NATIONAL RESOURCES DEFENSE COUNCIL, AND STEERING COMMITTEE VICE CHAIRMAN, KENNETH KIRK, EXECUTIVE DIRECTOR, ASSOCIATION OF METROPOLITAN SEWAGE AGENCIES, AND ERNEST SHEA, EXECUTIVE VICE PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS**

Mr. WOODRUFF. Thank you very much, Mr. Chairman.

It's appropriate, I guess, to begin with a good afternoon. We are pleased to be here and to have an opportunity to present our views to the distinguished members of this subcommittee.

My name is Paul Woodruff. I'm the President and CEO of an environmental consulting firm, Environmental Resources Management. We are based in Exton, Pennsylvania. We have 70 offices around the world and employ about 2500 people.

I have over 30 years of experience in the water and environmental management field, but the reason I'm here today is to share with you my experience as the Chairman of the Steering Committee of Water Quality 2000. I've also served as the Chairman of the Water Environment Federation's Government Affairs Committee.

I'm joined on my left by Bob Adler, who is the Senior Attorney for the National Resources Defense Council and he is the Steering Committee Vice Chairman; and on my right is Ken Kirk, who is with the Association of Metropolitan Sewerage Agencies; and on my far right is Ernie Shea who is with the National Association of Conservation Districts.

In addition, here in the audience we have a number of other members of the Steering Committee and I'll mention their names in part to illustrate the breadth of the kind of organization that has brought together the final report for Water Quality 2000.

We also have with us Judy Campbell Bird who is with the Environment and Energy Study Institute; Dr. Peter DeFur, who is with the Environmental Defense Fund; Dr. Margot Garcia, who is with the American Planning Association; Carolyn Olsen now representing the Water Environment Federation; Dick Schwer, one of our representatives from industry who happens to be employed by DuPont. Catharine DeLacy, who had another commitment and unfortunately had to leave, represents the Occidental Petroleum Corporation.

We have, of course, provided you a written statement. This afternoon, I'm going to try to recapitulate a portion of that and highlight a few of the suggestions.

First of all, I need to tell you just a little bit about Water Quality 2000 as we are a unique kind of organization. We represent the cooperative effort of some 75 organizations, including environmentalists, Federal, State and local officials, professional and scientific societies, and academics.

Our mission is to propose and promote national policies and goals for the 21 Century that will protect and enhance water quality with a specific agenda for action. Water Quality 2000 operates under bylaws which spell out our governance process and the rights and obligations of each member organization.

We've been funded by a variety of sources, public and private and our 20-member steering committee, which I head, is elected and represents the membership-at-large. So I'm here today not on behalf of any single organization, but to present the consensus views of a diverse coalition of interests.

The Clean Water Act is probably the most successful environmental statute. Even so, implementation of water quality goals and policies have been complicated by conflict between competing interests and emphasis on the short term, and a patchwork quilt of narrow and sometimes conflicting laws and regulations.

As we approach the 25th anniversary of the act, leaders of WEF, NRDC, the Chemical Manufacturers Association and other organizations felt it would be appropriate to step back, take a thoughtful look at our current programs, and identify appropriate new approaches for the 1990s and beyond.

When we began Water Quality 2000 in 1988, the first thing we agreed on was a vision statement—Society living in harmony with healthy, natural systems. We used our vision statement as a yardstick to see where we stood.

In our interim report which was completed in 1991, we found that although we had made significant progress since the passage of the 1972 Act, and we've spent many billions of dollars, both public and private money, more needs to be done to achieve the objectives of the act, i.e., to restore the physical, chemical and biological integrity of the Nation's waters.

The interim report identified a series of impediments, some technical, some financial, institutional and social. In fact, we believe the root causes are social. This report concluded that focusing attention on the societal cause of water quality problems is essential if we are to articulate long-term solutions in which societal goals are compatible with Clean Water.

Our final report, which I hope some of you have seen, A National Water Agenda for the 21st Century, responds to this conclusion by calling for fundamental changes in U.S. water policy. This report provides a sound, conceptual framework within which to consider improvements to the Clean Water Act and other laws.

The report has been endorsed by 64 organizations to date and we're still counting. That does not include any of the Federal agencies which participated in the development of this report.

While we did not achieve consensus on every subject, there is broad support for the overall policy direction. Although the report

does not focus primarily on the Clean Water Act, or on legislative matters, it does contain many specific recommendations which we hope will be of assistance to the subcommittee.

These recommendations were developed using a workgroup approach that involves several hundred experts working over a long-term time frame and certainly representing a broad cross section of interests and disciplines.

The report begins by articulating eight guiding principles for national water policy. Let me share those with you quickly. One, water resources must be protected to sustain environmental values and the health of our economy. Two, protection efforts must emphasize avoiding or minimizing pollution and resource degradation rather than dealing with their effects.

Three, protection efforts must involve cooperation between all levels of Government and the private sector, with the level of Government most appropriate to the problem, principally responsible for its solution. Fourth, protective efforts should focus on environmental results within appropriate hydrologic units or watersheds, with successes and failures in attaining water resource goals regularly reported to the public.

Five, protection efforts should adopt a holistic perspective, taking into account the interconnectedness of quantity and quality, surface water and ground water, aquatic and related land resources. Unfortunately, that's what makes the job so tough.

Sixth, protection efforts should include a mix of voluntary and mandatory approaches. Seven, protection efforts must be based on a sound scientific understanding of both the natural and artificially altered environments and their interaction.

Eighth, protection efforts should be designed to ensure that beneficiaries of investments in water resources pay the full cost of these investments, while contributors to water quality impairment fully internalize the cost of their polluting activities.

Building on these principles, the report identifies three strategies for implementing an integrated, holistic national policy: first, preventing pollution; second, increased individual and collective responsibility for protecting water resources and third, the overarching watershed-based planning and management.

A few definitions. Integrated means a policy that protects surface, ground, coastal waters and habitat. Holistic means a policy that considers human health; water supply and ecological concerns and avoid simply transferring from one media to another.

Pollution prevention means that we must manage our affairs—how we live, we work, we farm, we recreate, we transport, and we plan—so that as a society, we generate less pollution and manage the waste we do produce better.

Our recommendations for pollution prevention include a mix of voluntary and mandatory measures to promote continuous improvement in all sources and sectors. This includes agriculture, manufacturing, land development, energy, transportation, all types of commercial activity, and individual households.

Prevention is particularly important as a strategy for controlling runoff from agriculture and urban lands, which as you've been told many times already today, is our biggest remaining water quality challenge.

Increased individual and collective responsibility means we must empower the American people to adopt a heightened sense of responsibility for protecting water resources. It also means that all of us must contribute our fair share to the cost of cleanup and prevention. Responsible behavior, whether it's in our homes, our farms or our factories, should be encouraged through education, incentives, and yes sometimes regulation.

Implementation of watershed planning and management is central to all of our other recommendations. One of the biggest institutional impediments to progress is the fact that water programs are typically created and managed along political boundaries.

Nature, of course, unfortunately, doesn't recognize political boundaries. Watersheds are the logical hydrologic unit within which to implement and evaluate our prevention efforts. Water Quality 2000 strongly advocates a nationally-coordinated program with regional watershed planning and management organizations for all 21 of the U.S. water regions.

Watershed planning and management is, as you are well aware, not a new idea. Although areawide planning was a major feature of the original Clean Water Act, this approach was not fully embraced in the 1970s or 1980s for a variety of reasons. We believe the Nation is now ready and indeed must embrace this approach. Our ability to monitor and model is much greater than it was 20 years ago. Many of the gross and obvious water pollution problems have been addressed.

More importantly, the magnitude and nature of our remaining problems, particularly the problem of urban and agricultural runoff, makes a standardized, national approach impractical, wasteful and unlikely to be successful. In fact, a 1976 report prepared by the National Commission on Water Quality stated, "Any effective strategy for control of nonpoint sources within the framework of the Act can only be a product of the areawide planning process."

The watershed approach allows us to consider cumulative impacts and make rational decisions concerning the allocation of limited financial resources, for example, whether in a given watershed it would be more effective in terms of improving water quality to spend \$20 million on a local municipal wastewater treatment plant or to spend the same kind of money to help implement best management practices for agriculture.

Our report includes the following recommendations for implementation of a watershed based planning and management. There are a lot of "shoulds" here for Congress.

Congress should create a new nationally-coordinated program of watershed planning and management, including a mandate for implementation of activities as a condition of participation in planning. That's a key difference from the last time around.

Second, as requested by States, Congress should encourage, authorize and approve the creation of interstate regional mechanisms, including joint Federal-State compacts, to plan and manage water resources. Congress should impose no particular management form on the States and should build upon existing watershed mechanisms. However, planning and management institutions should be required in all 21 of the major water resource regions in the U.S.

Watershed planning and management institutions should be nested to reflect the multiple orders of progressively larger watersheds. Institutions created to plan and manage the smaller watersheds should participate in the planning and management of the larger watersheds to which they belong.

Watershed planning and management institution should plan for protection of groundwater resources and related ecosystems that cross watershed boundaries. That would be a departure from anything we've attempted in the past.

Watershed planning and management should be financed from multiple sources of funds to be made available by the Federal Government, participating State governments, local governments and where appropriate, the private sector.

Many of the other recommendations in our report, including the pollution prevention recommendations can and should be implemented locally within the watershed context. Other specific actions well suited to the watershed approach include: water quality-based permitting for point sources; coordinating local and regional land use and transportation planning with watershed protection goals; shifting water delivery systems away from political boundaries toward more efficient watershed boundaries; and management of runoff, including CSO abatement in developed urban areas.

I would like to emphasize that our call for a nationally-coordinated program is not meant to imply Federal management of individual watersheds. The objective of a national program should be just the opposite—to empower watershed-based efforts at the regional, State and local levels. The Federal role should be to provide leadership, coordination, technical assistance, and some financing and to redirect existing programs to provide incentives and eliminate barriers to a holistic, integrated approach.

I would like to provide you with a copy of an excellent background paper on watershed management in the U.S. which was prepared for Water Quality 2000 and request that it be made a part of the hearing record, along with the executive summary of our final report.

I would like to briefly highlight our suggestions for improved Federal leadership in protecting water resources. More information on our recommendations relating to nonpoint source and industrial pollution prevention, improvements to traditional point source control programs, wetlands protection and financing is provided in our written statement.

First, the foremost responsibility of the Federal Government must be to provide leadership on societal change in adoption of a holistic approach. Federal agencies must implement their water resource programs in a coordinated manner and should set an example for other levels of government, private landowners and facility operators by assuming responsibility for compliance with Federal laws and model land uses at all Federal facilities.

Second, Congress should authorize and fund a new interagency water policy coordinating council, comprised of the major Federal water resource agencies, plus other Federal agencies with authorities that can affect water quality.

Third, Congress should consolidate some or all of the 23 committees and subcommittees that have some jurisdiction over water is-

sues. Water Quality 2000 identified conflicting and overlapping congressional jurisdictions as one of the major impediments to enactment of integrated and holistic solutions.

Congress should adopt a national policy on groundwater protection and EPA should take the lead in forging a new intergovernmental partnership to protect groundwater. Under a new national policy, all States should adopt comprehensive programs that integrate groundwater and surface water protection activities.

In our deliberations, Water Quality 2000 could not agree on whether the Federal Government should play a more comprehensive role in establishing and overseeing groundwater protection activities.

To enable us to accurately measure our progress, Congress should fully fund an adequate national system to integrate Federal, State, local and private water quality monitoring. We have a lot of data out there but it's not coordinated, it's not in the right place, it's not as useful as it could be. Monitoring should include ambient chemical, biological and physical characteristics. Our present database is sparse, particularly with respect to a more comprehensive picture. We frequently have to rely on indirect measurements.

In conclusion, the pending Clean Water Act reauthorization is an obvious opportunity to make some of the changes advocated in our report, but although legislation is one very important way of affecting change, it is not the only one. I know you recognize that. It's often not even the best way.

As our recommendations indicate, research, funding and incentives, enhanced State and local programs, and probably most important of all, even though it's the long-term answer, education must all be a part of the national water agenda.

One of the pitfalls we must avoid is the tendency to believe that enactment of a new law, usually regulating someone else, will automatically solve the problem and allow us to go on with business as usual.

We appreciate the opportunity to appear before you today. WEF and the other Water Quality 2000 member organizations welcome the opportunity to work with you and other members of the subcommittee and your staffs in the weeks and months ahead.

That concludes my testimony this afternoon.

Mr. APPLGATE. I appreciate your testimony, Mr. Woodruff. You presented your program well. You told us what needed to be done and what we should do. I think that's good. We sometimes need to at least know. We don't always have anybody come up and tell us.

It doesn't necessarily mean that we're going to do it but we may. I think it's very good and I appreciate Water Quality 2000 because I know it is an outstanding organization which directs itself to seeing that we do have clean water throughout this Nation and that our people have accessibility to it. I think it's very important.

You mentioned that you support a fully funded and enforceable nonpoint pollution control program. What do you consider a fully-funded level?

Mr. WOODRUFF. The level of funding was not something that the Water Quality 2000 group dealt with in terms of specifics. Of course this program, current congressional considerations are after the fact. Our deliberations produced results that culminated in the

publication of this report last November, so I can't give you any specific number.

Mr. APPLGATE. Do you think you can come up with a number?

Mr. WOODRUFF. We could attempt to do that through our mechanism to provide some guidance.

Mr. APPLGATE. Well, I assume that since you support something like that, you know that we're under the gun too, so we sort of like to know what it is that people are thinking and get some accurate figures.

You are aware that the Coastal Nonpoint Program was enacted in 1990. Do you see that as a model for improving the current 319 Program?

Mr. WOODRUFF. Anybody here on the panel who would like to respond to that?

Mr. ADLER. I'll take a crack at that. We looked very closely at both the existing Section 319 Program under the Clean Water Act which is predominantly a planning-oriented and voluntary program, and we took a look at the new Coastal Nonpoint Source Program under the Coastal Zone Management Act. Given that we were trying to reflect the concerns of both the public and the environmental community and the concerns of farmers and their landowners who are affected by both of those programs, we tried to strike a balance between the 319 Program and the Coastal Zone Nonpoint Source Program.

As Paul has indicated, we support a mixture of voluntary and mandatory approaches to nonpoint source control in what we think is a fairly concise and balanced approach. One, impose enforceable requirements but only in impaired watersheds so you don't require landowners and farmers in unimpaired watersheds to be subject to the sort of enforceable programs that we have in the Coastal Nonpoint Source Program, but you do require some sort of enforceable mechanisms in impaired watersheds around the country.

Two, we recognize the concerns of the farming and other landowner communities not to have some bureaucrat in Washington tell them what to do on their farms. We support a program like the Coastal Nonpoint Source Program where EPA and other Federal agencies provide guidance on a menu of options for best management practices and other ways to reduce pollution of our water from nonpoint sources.

Key to our program is that farmers and other landowners have a direct say in what happens on their land. So we would like to form a partnership between landowners and government officials to have site-specific but enforceable mechanisms on their farms and on their lands to control nonpoint source pollution.

Mr. APPLGATE. What kind of enforcement mechanics would you recommend?

Mr. ADLER. We believe that the form of enforceable mechanisms ought to be left to individual States. One form of enforceable mechanisms might work better in Iowa and another better in Maryland. That is essentially the model of the Coastal Zone Management Program, each State gets to choose what form of enforcement mechanism is most appropriate for their part of the country.

Mr. APPLGATE. Mr. Woodruff, you stated that you advocate a new national program of watershed planning, representing all of

the 21 national watersheds. These watershed areas do cross State boundaries. How would you address recalcitrant States who don't wish to participate or those who do not live up to their expectations?

Mr. WOODRUFF. There probably has to be some type of tie to the funding mechanism to bring that about. Although we did not deal with that in any specific sense, that is a key element in trying to bring this about. We recognize that.

Mr. APPELEGATE. Mr. Adler, I was going to ask you, how do you define, when you talk about an impaired watershed?

Mr. ADLER. There are a number of existing programs under the Clean Water Act to define impaired watersheds. We had a nonpoint source assessment under Section 319(A) of the Clean Water Act, 301(L) of the so-called Toxic Hot Spots Program identified approximately 16,000 watersheds around the country that are impaired predominantly by runoff pollution, nonpoint source pollution.

So we believe that we can draw on existing databases to identify which watersheds are impaired and which are cleaner. Of course our data is incomplete and we support, as Paul mentioned earlier, improved monitoring programs around the country to determine where our water quality might be better or worse than we currently believe. We would start with those existing databases.

Mr. APPELEGATE. You said 16,000?

Mr. ADLER. 16,000. Under the 304(L) Program, the States identified approximately 17,000 impaired watersheds around the country. Somewhere around 700 or 800 were impaired largely by point sources, by factories and sewage plants. The balance were impaired, according to the State data, largely by runoff pollution.

Mr. APPELEGATE. I thank you very much for your answers to my questions and for your testimony.

Mr. Boehlert.

Mr. BOEHLERT. Thank you, Mr. Chairman.

Mr. Woodruff and your associates, I want to thank you for your excellent testimony. I know I'm going to read this from cover to cover. I'm pleasantly surprised, Mr. Adler, particularly to hear from you and some of your comments to indicate a recognition of some of the problems, for example, farmers have in dealing with the subject matter.

I'm sure you're familiar with the New York watershed case, aren't you and what I'm coming to grips with right now?

Mr. ADLER. Yes, sir.

Mr. BOEHLERT. So it's interesting, you're wearing one hat with this group here and you sometimes have to wear another hat with the National Resources Defense Council. I had to quickly check with counsel to make sure I heard you correctly and identified you correctly. I liked what you're saying because you're dealing in the real world. That's critically important.

I stand second to none in terms of my credentials in the environmental community and you may know some of the work I've done. I was just so pleased to hear what you're saying because some of the people in rural America are hurting and the last thing they need is some bureaucrat from out of town to come in and say, here's what you can't do. That's not the America they wanted to embrace.

One thing for Mr. Woodruff. I don't want to ask any detailed questions now because I'm confident that when I do read your publication, I'll learn an awful lot. I just want you to know there's some hope.

I couldn't agree more with you in talking about the 23 committees and subcommittees that have overlapping jurisdiction. We're engaged in a process right now of reinventing Congress. If Mr. Clinton wants to reinvent government, at least we're going to try to reinvent Congress. I'm sure that gives you some hope.

Mr. WOODRUFF. Yes.

Mr. BOEHLERT. It's long overdue. When you walk into Democratic caucus, which I don't do because I'm a Republican, you say hello, Mr. Chairman and everybody turns their head. We've got 280 various entities in the Congress, standing committees, select committees, joint committees. There are committees all over the place in essence just to create little fiefdoms for some of my friends in the majority party. There is hope there.

I like the idea of talking about flexibility. That word comes out all the time as I read your testimony. You give us an example of whether in a given watershed, it would be more effective in terms of improving water quality to spend \$20 million for improvements in municipal wastewater treatment plants or to spend that same amount helping to implement best management practices for agriculture. Those are questions we've got to deal with. Flexibility will be very helpful.

Just two days ago, as you know, Mr. Adler, the market for permits under the Clean Air Act has entered into, joined as we say. Maybe we ought to have some sort of permitting system dealing in this area that we could explore the possibility of developing. I'm not sure that's practical but I think it's something we ought to look at. You have to be more innovative as we approach these issues.

I just want to say thank you very much. Thank you for being patient, for waiting so long to finally appear here. I don't want you to think there is a lack of interest the Chairman and the ranking member and one of our good colleagues are the only three people here. There's a lot of interest in what you have to say and we're going to be following it very closely and view you as valuable resources.

I thank you for testifying and you'll be hearing more from us.

Mr. WOODRUFF. Thank you very much.

Mr. APPLGATE. Thank you, Mr. Boehlert.

Mr. Menendez.

Mr. MENENDEZ. Thank you, Mr Chairman.

I want to echo Mr. Boehlert's comment. This is one of the few days I don't have to conquer amoebic cell division and be at three or four different locations at the same time, so it gives me an opportunity to really listen to the testimony and participate.

I have a couple of questions concerning scientific standards, which you mention on page four of your statement. I represent the area in New Jersey along the Hudson River waterfront, including Port Newark in Elizabeth. A permit for maintenance dredging has been delayed nearly three years, partly because the standards for measuring the sediment changed several times during the process. The port generates \$20 billion of economic activity each year and

provides 180,000 jobs. All of this has been unnecessarily jeopardized.

How do we deal with changing scientific standards? When a permit application is filed, should the standard remain the same throughout the process? What if we change the standard and find a better standard in the middle of the process, what happens then? It seems to me we spend an inordinate amount of money testing and meeting one set of standards and then in the middle of the process we have a new scientific standard which is then applied to an application already in the middle of the process. There doesn't seem to be a lot of equity in that.

Mr. WOODRUFF. Do any of you want to comment on that? I think the difficulty is how do you marry in a good science and good administration. That's the difficulty. We do so awkwardly, inefficiently is the answer. Sometimes we've seen instances of overkill. We've got programs that have been put in place, limits have been established only to later find out that they were probably over-protective and we have spent money we wouldn't have needed to spend. In other instances, we have the flip side of that, so it's a balancing act to try to get it right.

Part of the problem is spending insufficient dollars on development of science. We are handicapping ourselves, we're wasting resources in the longer run by not spending sufficient resources on getting better science, better data, better information. That's part of it.

Another part is, we've got to balance the length of the permitting cycle. The cycles are too long. We learn things. A ten-year period is a long period of time today. Science is just moving too fast to have ten year periods. On the other hand, ten year periods is a very nice period of time in terms of the administrative costs to go around. So somewhere we've got to balance between those two extremes. Do you want to add anything to that?

Mr. ADLER. If I may, I think you raised a very important point in an era of rapidly evolving science. We need to improve the ability and expedite the ability of agencies to act on good, new science quickly. NRDC started pushing EPA to write effluent guidelines for the offshore oil and gas industry in 1979. That regulation was issued two months ago, 12 or 13 years after the law required them to write those regulations.

Scientists are learning more about the toxic effects of chemicals every day and yet, given the current bureaucratic red tape, it takes EPA years to get out a new standard which posits the sort of dilemma that you indicated. We need to think about how to streamline the bureaucratic processes that impede EPA from getting out new water quality standards and other regulations in less than 3, 4, 5 and sometimes 10 years.

Mr. MENENDEZ. Let me just take this question a step further. I agree with what you're saying, but in the middle or towards the end of a permitting process, a new standard comes up, but all the work that has been done is based upon a previously-accepted, scientific standard.

Would it be fair to say, as a rule, that we should follow the scientific standard clearly enunciated and agreed to by the administering agency and then if there is a new standard anywhere be-

tween the middle and the end of this process, that it will not be applicable to that particular permit because otherwise, we start the process again. It could be a never-ending process.

Mr. WOODRUFF. My personal point of view is it depends on the specific of the pollutant of concern and its side effects or its effects. In some instances, clearly, the course you're suggesting is an appropriate one because the next time around, it can be dealt with in the intervening time frame. The benefits to be gained by stopping the process and going back to home base, near home base and reconstituting the thing, the benefits aren't there. You'd do better to get the improvements in place that were ready to go.

In other instances, they may be relatively rare, but in other instances, we may learn something that is of a critical nature. So it's again very hard to have a generality. We could talk in terms of designing a rule that looks at the effects and if it passes a threshold of criticality, then you go back and revisit and redo. If it doesn't pass that threshold, you just keep going and you get it the next time around.

Mr. MENENDEZ. Could you expound on number eight, your policy? What that means, as well as when you had a definition for holistic and listening to who comprises your organization, I would hope the definition of holistic has no economic consequence in it whatsoever. Could you tell me how you came to that?

Mr. WOODRUFF. The question first was the guiding principles, number eight?

Mr. MENENDEZ. Yes. Exactly what do you mean by "ensure the beneficiaries of investments in water resources pay the full cost of the investment while contributors who impair fully internalize it."

Mr. WOODRUFF. Let me repeat that for the benefit of all here. Number eight says,

Protection efforts should be designed to ensure that beneficiaries of investments in water resources pay the full cost of these investments, while contributors to water quality impairment fully internalize the cost of their polluting activities.

The latter part of that is a long way of saying the polluter paid policy is what in his mind. The beginning statement of that is designed to ensure that people recognize that benefit from clean water, there is a cost to get that and they should be prepared to be contributing to it. If that's not clear, we'll try another pass.

Mr. MENENDEZ. If that's what you're saying, I understand.

Mr. SHEA. Economics represented a major area of discussion within the various committee meetings that were held as we developed these recommendations. I think the agricultural nonpoint source pollution control recommendations are a good example.

We talk about the need to change the way we farm, we talk about the need to go with best available technology and the application of practices, particularly in those impaired watersheds. We also at the same time recognize these farming operations must remain economically viable. Society as a whole benefits from the production of food and fiber here in the United States. The consumer has, in our recommendations, a responsibility to help share in some of those costs through technical assistance, cost-sharing commitments and other contributions. Economics I think are in our definition of holistic.

Mr. WOODRUFF. Does that address the second part of your question?

Mr. MENENDEZ. When I read a definition that says, "considers human health, water supply"—these are all laudatory goals—and "ecological concerns, and avoid simply transferring pollution from one medium to another," we all, I think, should share those goals. They all can probably be universally accepted. The question is what is the balance and the cost?

For example, in my district, I have the highest rate of unemployment in New Jersey, and one of the highest rates of unemployment in the Nation. We try to balance these concerns. We all want clean drinking water, water we can enjoy. New Jersey has a tremendous concern as it relates to its shore area, but there are balancing costs.

The concern I have is when we do not consider economic balancing. It seems to me that it is a simple Ross Perot-type of question, "do you want clean water?" Yes, of course we do. But at what cost? Then the balancing process comes out and people begin to decide, well, what are the priorities.

I read your holistic definition and I saw no comment as it relates to economics and I think people have to be faced with the realities of what the economics are to obtain certain social policies and that includes clean water.

Mr. WOODRUFF. I think there is agreement in general from the Water Quality 2000 organizations that economics is a part of the total, that if we don't have clean water in the long run, we don't have a strong economy. For sure, if we don't have a strong economy, there's no way to pay for clean water. It is a chicken and egg, which comes first. We've got to work at them both simultaneously.

Mr. ADLER. Let me give you one example in the report of how we considered economics returning to the nonpoint source area. We made it very clear that farmers need to do their share to clean up watersheds, but we want to do so in a way that's consistent with economically viable farming operations. So there are a number of specific ways in the report where we took economics into account.

I think it's very important not to consider jobs and water quality to be either-or tradeoffs. In addressing the more urban setting in which your constituents live, urban watershed restoration is an important area where we think we can both create jobs and create a sounder, safer environment for your constituents.

Urban watersheds have been sorely neglected around the country relative to some other waters. Yet, I'm sure you know that many of your constituents fish off the pier and eat fish that are contaminated by toxic pollutants from upstream. I'm sure you're aware that the habitat of the aquatic ecosystems in your district are far more degraded than in many other areas of the country. We ought to be targeting our efforts and our Federal funding to restore those urban watersheds in a way that can restore the health and vitality and economic base of your community as well as others around the country.

Mr. MENENDEZ. Thank you very much.

Thank you, Mr. Chairman, for your flexibility.

Mr. APPLEGATE. Thank you, Mr. Menendez.

I've heard a lot of people say that there should be less government involvement, that even local government perhaps could do a better job, the private sector could do a better job. I assume that

may be right. Efficient government, at best, is inefficient, but it's what we have because we live in a democratic society and we have people who run programs who don't fully understand the programs. We have people in Congress who pass laws on programs they don't fully understand. I realize that. We are just part of a group of people out there who were sent here to do a job. The beauty of it is that for 218 years it's worked.

We have congressional jurisdiction, we have bureaucratic jurisdiction, we have White House jurisdiction and we have the courts. What we always do here isn't necessarily the last word; it generally isn't because the bureaucracy usually comes around and defines what it is that we intended to do in the first place, doesn't always say what it is that we wanted to do. Otherwise, we might take our names off the bill, but that happens. Then, many times it ends up in the courts and comes out with an entirely different decision.

I guess what I'm saying is that we are trying our best to fully understand and to absorb all of this information we have. I think we are blessed too that we have good staff people behind us and those who have been working with the subject for a good many years and have been working for a number of the people who have testified in front of us.

They will, in their good wisdom, point us in the right direction and help us, as you will. God willing and the creek don't rise, we'll come through with something that will be reasonably acceptable to everybody and we hope that will be the case.

This subcommittee will recess until tomorrow morning at 9:30 a.m. when we will hear testimony from local governmental organizations.

Thank you very much.

[Whereupon, at 1:00 p.m., the subcommittee was recessed, to reconvene at 9:30 a.m. on Thursday, April 1, 1993.]

**Testimony of  
The Council of Infrastructure Financing Authorities  
Before the  
House Water Resources & Environment Subcommittee  
on Reauthorization of the Clean Water Act  
March 31, 1993**

Mr. Chairman and members of the Committee, I am Terry Agriss, President of New York State's Environmental Facilities Corporation. I am pleased to appear before you today to testify both in that capacity and as President of the Council of Infrastructure Financing Authorities (CIFA). CIFA is a national organization of State and local authorities with the mission of financing public infrastructure facilities. Most of our State members manage at least the financial component of the State Revolving Loan Funds (SRFs) for wastewater treatment, and as such, are vitally involved in the current and future success of the SRF program.

My testimony will address Title VI of the Clean Water Act and the SRF provisions. Briefly, we support a reauthorization of this program which, from our experience as State managers, is working extremely well as an efficient and economic mechanism to provide low-cost financing of public wastewater treatment needs. Clearly, the SRFs have fulfilled the vision which Congress had when it created the loan funding mechanism in 1987.

We urge the Committee and the Congress to extend the programmatic and financing authority for Title VI which, with some minor legislative adjustments, can address the nation's major needs for wastewater funding well into the next century. In support of this assertion, there are several points that I would like to make to the Committee.

**State Revolving Funds: A Success Story**

In creating the State Revolving Loan Funds in 1987, the Congress made a bold and formative departure from the traditional grant approach of federal assistance. There was wisdom in this change. With five years experience, we are pleased to say that the SRF program is working and working well. All 50 States and Puerto Rico have met the requirements of Title VI of the 1987 Act, having passed the requisite laws, provided the necessary matching funds, and set up the administrative and financial management mechanisms to effectively put the program in place. All of these State programs are now fully operative, making low and no interest loans to communities to meet their wastewater financing needs.

A survey undertaken for CIFA by the Ohio Water Development Authority of all State SRF programs found that as of June 30, 1992, States had received nearly \$6 billion in federal capital grants for the SRFs. This federal investment, together with \$1.4 billion in State matching funds and over \$5 billion created by leveraging the individual State Funds, has formed a total lending pool of \$10.7 billion from which 1,363 project loans have been made. It is noteworthy that the federal contribution has been more than doubled by state match and leveraging of the funds.

The survey further showed that loans were being made for a range of eligible project needs, including correction of combined sewer overflows, storm water and non-point source controls, in addition to the more traditional sewage treatment projects. The SRFs are adaptable and responsive to meeting new priority needs for financing and States are being innovative in their application.

### Advantages of Loan Financing

From the state and national perspective, there is a definite advantage to loans over project grants. While we appreciate that some municipalities would prefer grant assistance over a subsidized loan, and that you may be hearing this from your constituents and colleagues, there are sound reasons, in terms of economy of national expenditure and efficiency of project financing, for Congress to maintain the SRF funding approach and resist entreaties to return to the grant approach for federal support. Most important:

**Loans Provide Assistance to More Projects:** The combination of the state match, the debt service payments and the additional funds that can be made available by leveraging, creates a loan pool capable of financing a much larger share of project needs than would a grant program at a federal share of 55% or higher.

For example, if the SRF were funded at \$2 billion a year for the next 12 years with the existing 20% state matching requirement and a leverage factor of 2:1 for 60 percent of the Funds, a loan pool would be created capable of financing \$133 billion in projects over the next 20 years. The same amount of federal contribution directed to grants would finance only \$44 billion in wastewater projects – less than one third of the amount that could be financed through the loan program. Moreover, the loan pool will continue to grow after federal contributions stop, whereas the grant assistance program stops with the last federal contribution. With a dimension of estimated need for wastewater funding in excess of \$100 billion and growing, it seems clear that responsible federal programs should be aimed at sustaining and enhancing the loan program. A graphic depiction of this SRF scenario, is attached to my testimony.

**Loans Help Control the Federal Deficit:** The permanent funding base provided by the SRF eventually diminishes the demand for future federal contribution. Loan programs begin revolving money for new projects almost immediately and can reduce the structural deficit by at least \$2 billion annually when the SRF is fully capitalized.

**Loans are More Efficient:** Experience with the SRF, thus far, has demonstrated their relative efficiency as compared to grants. Greater local responsibility under a loan program results in lower project costs, encouraging communities to build to meet their actual needs rather than building to meet grant eligibility. For example, in 1989, the Town of West Monroe in central New York State built a low pressure sewer system and treatment facility using \$650,000 in SRF loan proceeds and a \$45,000 state grant. By contrast, a few years earlier, the same town, anticipating a Title II grant, planned a facility to achieve the same environmental purpose which would have cost \$1,250,000. The record is replete with such examples.

Loans, which are more efficient to manage from a federal and state perspective, significantly reduce the manpower requirements for federal supervision that was associated with grants administration. Since 1987, total staffing in EPA's Wastewater and Enforcement Compliance program has been reduced by more than 100 FTEs, reflecting in part the shift from grants to loan management. Reductions in the federal workforce are not an insignificant consideration given present budget constraints.

**Loans Fund Projects Faster:** Because SRFs can fund the total cost of most projects, they remove the need for communities to raise the additional financing necessary to cover their matching share of the grant plus the non-grant eligible components of the project. Moreover, with full availability of financing, projects are being completed up to 50% faster than under the grant program. There is no waiting on grant priority lists or for EPA grant reviews. There is an old adage in the construction business that "time is money," and expedited project construction leads to substantial savings.

Also, loan financed construction occurs more quickly because the loan program does not penalize communities that start their projects in advance of a loan. Since the SRFs allow loan refinancings, municipalities are encouraged to begin the design and construction phase when they are ready. Costs of planning and design can be refinanced under the SRF program, so the borrower does not risk forfeiting future financial assistance by beginning the process early. Since many SRF's have adopted a policy of immediate loan availability, there is no need for a borrower to arrange any separate interim financing for the project, avoiding additional financing costs. States with large needs have been able to leverage their available loan funds and are operating under a policy that any project can be financed when it is ready. Leveraging can double or triple available assistance under the loan program.

#### **Amendments to Title VI**

In addition to reauthorizing the SRFs, a few changes are needed in the Title VI provisions to make the program more efficient to manage. Specifically, we recommend the following:

**Eligibility of Land For SRF Financing:** Extension of funding eligibility for land acquisition associated with wastewater collection and treatment is important. With present limited eligibility for land acquisition, communities receiving SRF loans now

have to find other sources of financing for project related land purchases, causing complications and delays in initiating project construction. Broadened eligibility for land becomes especially important with the increased emphasis on correction of CSOs and non-point source problems where additional lands may be needed for run-off retention.

**Administrative Costs:** Cost of administering the Fund will continue and should be a legitimate use of a small percentage of each State's Fund, rather than being tied to a diminishing and eventually disappearing federal contribution. Allowing the use of a small percentage of the total value of the Fund for purposes of administering the SRF annually for the life of the program is a priority state management issue.

**Extended Loan Payback Period:** Under certain circumstances the State should have the flexibility to extend the loan payback period beyond the present 20 years. We would recommend reserving this benefit for special economic hardship cases tied to the project life rather than a specific number of years.

**Loan Principal Subsidy:** CIFA supports an amendment that would permit communities to reduce their principal payments under certain conditions. Specifically, we believe that a partial subsidy of loan principal would be the most effective and efficient means of assisting small, economically disadvantaged communities. This could be achieved through a mechanism similar to that used for leveraged loans. A portion of a state's SRF could be set aside in an earmarked reserve and the interest earnings on the reserve could be used to pay a part of a community's loan principal. This mechanism provides disadvantaged communities with necessary additional assistance, but does not invade the corpus of the revolving fund, so that the value of the fund is not diminished as would be the case with grants. Furthermore, CIFA recommends that even with a "principal subsidy," a community should be required to repay some portion of its loan, commensurate with its ability to pay. Repayment of a loan, even at a reduced amount, ensures that proper incentives for efficiency of project design and operation are preserved.

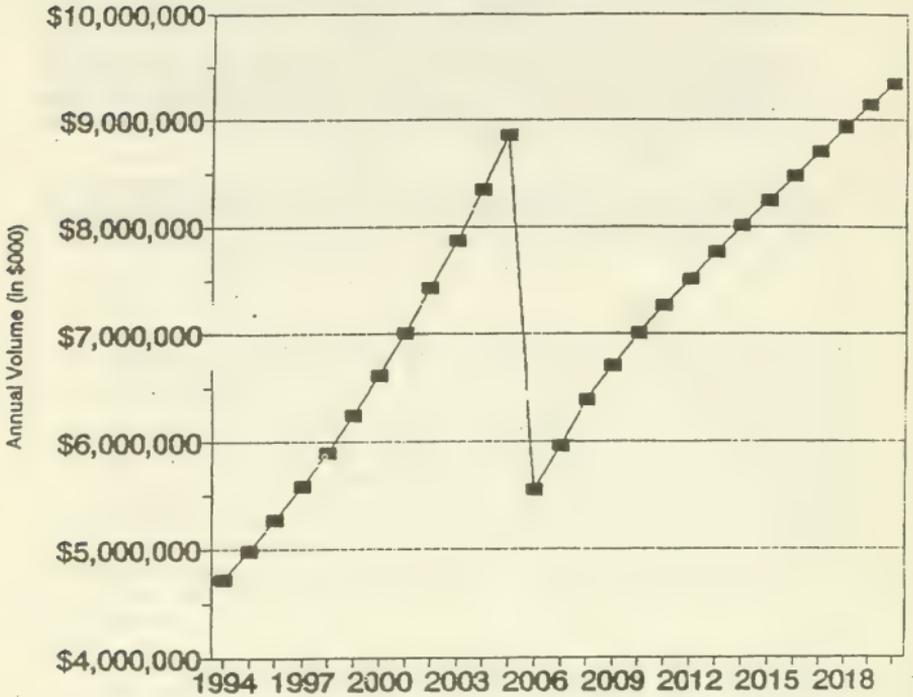

**Title II Provisions:** CIFA supports the elimination of the grant related requirements in Title II of the Clean Water Act, which are now applicable to "equivalency" projects equal in dollar amount to a State's annual Capitalization Grant. These provisions, which include those defined in 201(b), 201(g)(1), 201(g)(2), 201(g)(3), 201(g)(5), 201(g)(6), 201(n)(1), 201(o), 204(a)(1), 204(a)(2), 204(b)(1), 204(d)(2), 211 and 218, are either redundant or extraneous to loan arrangements under the SRF, and in some cases add months and even years to the time required to move a project to construction.

**Water Quality Infrastructure Needs Assessment:** Authorization for an expanded needs assessment of all potentially eligible wastewater facilities to provide improved data on infrastructure financing needs is essential. This is an important component of the nation's information base on infrastructure inventory and needs and a measure against which to assess progress and future program direction.

**Flexibility in SRF Management:** Efficiencies can often be achieved by the application of sound financial management practice. Unfortunately, in some cases these practices are prohibited by EPA regulations. For example, regulations that require all loan repayments to remain within the State's revolving fund prohibit States that have independent wastewater funding programs from combining their state and SRF loans in a single loan pool. This limits the capacity of the State to combine the funds for the purposes of more efficiently leveraging the funds. We recommend that the Congress instruct EPA to provide maximum flexibility to the States in the management of the SRFs, in keeping with sound financial management practices.

We hope that these observations will be useful to you and the members of the Committee as you work to fashion the provisions that will reauthorize the nation's clean water law, and thank you for this opportunity to testify.

### Annual Loan Obligations for SRF Program (Assumes Funding Ends in 2005)

- 1) Annual federal appropriation of \$2 billion, ending in 2005
- 2) Only states that are currently leveraging or expected to leverage soon are included in the leveraging program
- 3) Sixty percent of the program will be leveraged at two times the capitalization amount
- 4) Forty percent of the program will be direct loans at two percent interest rates
- 5) All loan programs are assumed to have a 1% return on equity
- 6) Includes recycling of SRF funds from 1990-93 capitalization appropriations

**Clean Water Act Reauthorization**

**March 31, 1993**

GOOD MORNING, CHAIRMAN APPLGATE AND MEMBERS OF THE SUBCOMMITTEE. I AM DENNIS HEMMER, DIRECTOR OF THE WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY. I AM HERE TODAY ON BEHALF OF BOTH THE NATIONAL GOVERNORS' ASSOCIATION AND THE STATE OF WYOMING.

THE NATIONAL GOVERNORS' ASSOCIATION HAS ADOPTED EXTENSIVE POLICY ON THE CLEAN WATER ACT. IN LIGHT OF OUR LIMITED TIME, I WILL DISCUSS ONLY PRIORITY RECOMMENDATIONS CONCERNING STATE REVOLVING FUNDS, NONPOINT SOURCE POLLUTION CONTROL, STORMWATER, AND WETLANDS PROTECTION. HOWEVER, I HAVE ATTACHED A COPY OF THE COMPLETE NGA WATER RESOURCES POLICY TO MY TESTIMONY AND REQUEST THAT IT BE INCLUDED IN THE HEARING RECORD.

THE CHALLENGE YOU HAVE BEFORE YOU IN REAUTHORIZING THE CLEAN WATER ACT IS TO CRAFT A LAW THAT ADDRESSES THE PROBLEMS OF THE NATION WHILE ALLOWING FLEXIBILITY FOR EACH STATE TO ADDRESS ITS SPECIFIC CONCERNS. BEFORE I DISCUSS THE GOVERNORS' RECOMMENDATIONS, I WANT TO MAKE A GENERAL PLEA FOR ATTENTION TO STATE RESOURCE CONSTRAINTS AND ALLOWANCE FOR FLEXIBILITY TO USE LIMITED RESOURCES IN THE MOST COST EFFECTIVE MANNER.

I REPRESENT THE LEAST POPULOUS STATE IN THE NATION. WHILE WE SHARE MANY OF THE PROBLEMS OF THE OTHER STATES, WE HAVE ALSO BEEN SPARED MANY PROBLEMS. TODAY, WYOMING, LIKE MOST OTHER STATES, INDEED THIS NATION, IS STRUGGLING TO FIND RESOURCES TO SUPPORT ESSENTIAL PROGRAMS. AS YOU HAVE NO DOUBT HEARD REPEATEDLY, WE DO NOT NEED MORE UNFUNDED MANDATES. WE DO NEED TO FOCUS ON AREAS THAT POSE THE GREATEST RISK TO PUBLIC HEALTH AND THE ENVIRONMENT. ALLOW STATES TO TARGET RESOURCES TO PRIORITY CONCERNS AND DON'T REQUIRE STATES TO EXPEND RESOURCES WHERE THEY ARE NOT NEEDED.

#### SRF FUNDING

THE GOVERNORS' RECOMMENDATION CONCERNING FUNDING IS PERHAPS THE MOST IMPORTANT ELEMENT OF THE NGA POSITION. CONTINUED PROGRESS TOWARD MEETING THE GOALS OF THE CLEAN WATER ACT DEPENDS ON ADEQUATE FUNDING OF WATER PROGRAMS.

CURRENT FUNDING LEVELS ARE CLEARLY INADEQUATE IN THE FACE OF PROJECTED NEEDS. THE GOVERNORS ADOPTED POLICY IN FEBRUARY RECOMMENDING INCREASED FUNDING TO \$5 BILLION PER YEAR THROUGH THE YEAR 2000 IN FEDERAL CAPITALIZATION GRANTS TO THE STATE REVOLVING LOAN FUNDS. THE GOVERNORS HAVE RECENTLY COMMUNICATED TO THE PRESIDENT AND THE APPROPRIATIONS COMMITTEES THAT IN NO CASE SHOULD APPROPRIATIONS FALL UNDER \$2 BILLION FOR WASTEWATER AND \$1 BILLION FOR DRINKING WATER. I HAVE ATTACHED A COPY OF THIS NGA LETTER TO MY TESTIMONY AND ASK THAT YOU INCLUDE IT IN THE HEARING RECORD.

NOTE THAT \$5 BILLION PER YEAR WAS THE SUM ORIGINALLY AUTHORIZED AND APPROPRIATED FOR WASTEWATER TREATMENT INFRASTRUCTURE UNDER THE CLEAN WATER ACT OF 1972, PRIOR TO THE INTRODUCTION OF COSTLY NEW MANDATES IMPOSED ON STATES BY THE 1987 CLEAN WATER ACT AMENDMENTS. CONSIDERING THE EFFECTS OF INFLATION, THE ANNUAL FEDERAL COMMITMENT HAS BEEN REDUCED BY MORE THAN HALF OVER THE LAST TWENTY YEARS. AT THE SAME TIME, THE PROGRAM IS MUCH MORE EXPENSIVE THAN IT WAS TWENTY YEARS AGO.

THE GOVERNORS SUPPORT THE CONTINUED USE OF STATE REVOLVING LOAN FUNDS (SRFS) AS THE PRIMARY SOURCE OF WASTEWATER INFRASTRUCTURE FINANCING. NGA OPPOSES FINANCING THROUGH DIRECT FEDERAL CONSTRUCTION GRANTS.

PAGE 2.

THE SRF PROGRAM IS AN EXCELLENT EXAMPLE OF EFFICIENT GOVERNMENT INVESTMENT. SRFs PROVIDE SUSTAINABLE LONG-TERM FUNDING, HAVE LOW ADMINISTRATIVE COSTS AND A 50 PERCENT FASTER PAYOUT RATE THAN CATEGORICAL GRANTS, AND PROVIDE INCENTIVES TO LOCAL GOVERNMENT TO REDUCE COSTS AND DEVELOP APPROPRIATE USER FEE SYSTEMS. REVOLVING AT THE STATE LEVEL, SRFs HAVE A MULTIPLIER EFFECT THAT CAN LEVERAGE TWO TO FIVE TIMES THE ORIGINAL INVESTMENT THROUGH BOND ISSUANCE AND LOAN REPAYMENT. IN CONTRAST, DIRECT FEDERAL GRANTS DISCOURAGE LOCAL INITIATIVE AND MAY REWARD NONCOMPLIANCE.

WHILE RECOMMENDING THE SRFs AS THE PRIMARY SOURCE OF WATER INFRASTRUCTURE FINANCING, THE GOVERNORS RECOGNIZE THE SPECIAL PROBLEMS OF SMALL COMMUNITIES AND THAT THE LOW INTEREST LOANS CURRENTLY AVAILABLE THROUGH THE SRFs DO NOT PROVIDE ADEQUATE ASSISTANCE TO SOME SMALL COMMUNITIES. HOWEVER, THE GOVERNORS BELIEVE THAT SMALL COMMUNITY NEEDS SHOULD BE ADDRESSED THROUGH SPECIAL ALLOWANCES IN THE SRF PROGRAM RATHER THAN THROUGH A SEPARATE GRANT PROGRAM. NGA RECOMMENDS FOUR PROVISIONS TO FACILITATE SMALL COMMUNITY PARTICIPATION IN THE SRF PROGRAM: SPECIAL ASSISTANCE THROUGH PRINCIPAL SUBSIDY PROGRAMS IN WHICH STATES USE SRF INTEREST EARNINGS TO SUBSIDIZE SMALL COMMUNITY PROJECTS; FORTY-YEAR LOAN REPAYMENT PERIODS; INCLUSION OF EXPENSES ASSOCIATED WITH THE PURCHASE OF LAND, EASEMENTS, AND RIGHTS OF WAY AS ELIGIBLE COSTS; AND ALLOWANCE FOR THE USE OF SRF ADMINISTRATION FUNDS FOR TECHNICAL ASSISTANCE TO SMALL COMMUNITIES.

I HAVE READ RECENTLY OF THE DEBATES ABOUT WHETHER THE STATE REVOLVING FUNDS FOR SAFE DRINKING WATER SHOULD BE INCLUDED IN THE CURRENT SRF, OR ESTABLISHED AS A SEPARATE FUND. WHILE THE GOVERNORS HAVE NOT TAKEN A POSITION ON THIS ISSUE, ON BEHALF OF WYOMING, I URGE YOU TO COMBINE THE TWO. WHILE I RECOGNIZE THE DIFFICULTY OF COMBINING FUNDS ADDRESSING TWO SEPARATE ACTS, EACH STATE NEEDS FLEXIBILITY TO ADDRESS ITS OWN SPECIFIC PROBLEMS. IN WYOMING, WE HAVE ADDRESSED OUR WASTEWATER NEEDS FOR THE NEAR FUTURE; HOWEVER, WE HAVE DRINKING WATER NEEDS PROJECTED TO COST AS MUCH AS \$250 MILLION.

I URGE YOU TO OVERCOME JURISDICTIONAL DIFFICULTIES AND TO IGNORE PROTECTIONIST CRIES FROM INDIVIDUAL PROGRAMS AND TAKE A COMPREHENSIVE APPROACH THAT DELIVERS THE MOST NEEDED SERVICES TO OUR CITIZENS.

#### NONPOINT SOURCE POLLUTION CONTROL

REDUCING NONPOINT SOURCE POLLUTION DEMANDS IN ESSENCE A SOCIETAL CHANGE. NONPOINT POLLUTION IS CUMULATIVE AND DIFFICULT TO QUANTIFY. A SUCCESSFUL NONPOINT SOURCE PROGRAM (NPS) IS A POLLUTION PREVENTION PROGRAM THAT MUST INVOLVE CONVINCING THE PUBLIC TO CHANGE WAYS OF DOING THINGS THAT MAY DATE BACK GENERATIONS. THEREFORE, THE PROGRAM MUST BE MORE EDUCATIONAL THAN PRESCRIPTIVE.

A MAJOR PART OF NONPOINT CONTROL REVOLVES AROUND MANAGING LAND USES. LAND USE DECISIONS MUST ACCOUNT FOR LOCAL GEOGRAPHICAL AND DEMOGRAPHIC SITUATIONS. THE PROBLEMS WE ARE TRYING TO ADDRESS ON THE PLAINS OF WYOMING ARE NECESSARILY DIFFERENT FROM THOSE OF MORE POPULOUS AREAS. THE GOVERNORS STRESS THAT STATES MUST RETAIN FLEXIBILITY TO TAILOR NONPOINT MANAGEMENT MEASURES TO LOCAL CONDITIONS AND OPPOSE PRESCRIPTIVE FEDERAL DEFINITIONS OF SPECIFIC MANAGEMENT MEASURES.

PAGE 3.

THE GOVERNORS BELIEVE THE CURRENT REAUTHORIZATION SHOULD BUILD ON THE EXISTING SECTION 319 PROGRAM AND OFFER SUGGESTIONS CONCERNING FUNDING, ACHIEVING MANAGEMENT GOALS, AND CONSISTENCY OF FEDERAL ACTIVITIES WITH STATE MANAGEMENT PLANS.

FIRST, INSUFFICIENT FUNDING IS CLEARLY A CRITICAL PROBLEM FACING STATE PROGRAMS. SINCE 1987, ONLY \$190 MILLION HAD BEEN MADE AVAILABLE TO SUPPORT THE SECTION 319 PROGRAM. TO PUT THIS IN PERSPECTIVE, CONSIDER FOR EXAMPLE THE JOINT EPA-USDA RURAL CLEAN WATER PROJECT. THIS DEMONSTRATION PROJECT SPENT \$70 MILLION TO TREAT ONLY TWENTY-ONE LOCAL WATERSHEDS. ALTHOUGH NO ONE KNOWS THE EXTENT OF THE NATION'S NPS POLLUTION PROBLEM, THERE ARE PROBABLY THOUSANDS OF WATERSHEDS REQUIRING SIMILAR LEVELS OF TREATMENT.

PROGRAM FUNDING MUST BE STABLE AS MANY PROJECTS WILL INVOLVE MULTI-YEAR EFFORTS. THE STATES AND PROJECT PARTICIPANTS MUST BE ABLE TO DEPEND ON A CONSISTENT LEVEL OF FUNDING. WE HAVE TOO MANY EXAMPLES IN WYOMING OF GOOD PROJECTS THAT FAILED BECAUSE THEY WEREN'T CARRIED TO FRUITION DUE TO LACK OF FUNDING. WORSE YET, WE HAVE TOO MANY INDIVIDUALS AND GROUPS JADED BECAUSE THEY WERE INVOLVED IN A PROJECT THAT WASN'T COMPLETED.

SECOND, THE PROGRAM NEEDS MORE STRUCTURE. NOTE THAT I SAY STRUCTURE, NOT PRESCRIPTION. CURRENTLY, THE GUIDANCE IN THE NONPOINT SOURCE PROGRAM IS EXTREMELY VAGUE. OTHER THAN INFORMING US THAT WE ARE TO PREVENT NONPOINT SOURCE POLLUTION, THE GUIDANCE IS OF LITTLE HELP IN ACHIEVING OUR GOALS.

NGA POLICY RECOMMENDS DEVELOPMENT OF A FRAMEWORK INVOLVING MORE CLEARLY ARTICULATED MANAGEMENT GOALS, A PROCESS TO DEFINE PROGRESS, AND SOME MECHANISM TO REWORK PLANS THAT DO NOT MEET EXPRESSED GOALS.

STATES SHOULD ESTABLISH MORE CLEARLY DEFINED GOALS FOR NPS PLANS BASED ON EITHER MEASURES OF WATER QUALITY OR MEASURES OF PROGRAM ADMINISTRATION SUCH AS NUMBER OF BEST MANAGEMENT PRACTICES IN PLACE. STATES SHOULD IDENTIFY BENCHMARKS TO MEASURE PROGRESS TOWARD MEETING SPECIFIED GOALS. IF STATE PROGRAMS DO NOT PRODUCE RESULTS, STATES SHOULD BE REQUIRED TO ADJUST SECTION 319 PLANS.

STATES NEED HELP FROM EPA IN DEFINING A CLEAR DIRECTION FOR THE PROGRAM. EPA SHOULD ASSIST STATES IN DEFINING GOALS AND IN MEASURING PROGRESS. HOWEVER, I EMPHASIZE THAT EPA SHOULD NOT MANDATE USE OF SPECIFIC BEST MANAGEMENT PRACTICES (BMPS). BMPS MUST BE TAILORED TO LOCAL CONDITIONS. IN MANY INSTANCES, THEY WILL BE IN LARGE PART A COMPILATION OF PRACTICES ALREADY DEVELOPED BY FEDERAL, STATE, AND LOCAL AGENCIES.

FINALLY, THE GOVERNORS RECOMMEND A CERTIFICATION PROCESS TO ENSURE THAT FEDERAL ACTIVITIES ARE CONSISTENT WITH STATE NPS PLANS. APPROPRIATE FEDERAL AGENCIES SHOULD HAVE INPUT INTO DEVELOPMENT OF BEST MANAGEMENT PRACTICES, AND SHOULD BE REQUIRED TO IMPLEMENT THEM AS PART OF THEIR LAND USE PLANNING.

#### STORMWATER

THE GOVERNORS AGREE THAT REDUCING STORMWATER CONTAMINATION IS IMPORTANT IN ACHIEVING THE FISHABLE, SWIMMABLE GOAL OF THE CLEAN WATER ACT. THE GOVERNORS STRESS, HOWEVER, THAT THE LAW MUST RECOGNIZE THE DIFFERENCES BETWEEN

PAGE 4.

STORMWATER AND TYPICAL POINT SOURCE DISCHARGES, AND THE DIFFICULTY IN USING THE NATIONAL POLLUTION DISCHARGE ELIMINATION SYSTEM, OR NPDES PROGRAM, IN ADDRESSING STORMWATER.

ALTHOUGH IT IS DISCHARGED AT DISCRETE OUTFALLS, STORMWATER IS REALLY NONPOINT POLLUTION. THE REGULATION OF POINT SOURCE DISCHARGES IS BASED ON KNOWN FLOWS, PROCESSES, PLANT PERFORMANCES, AND TECHNOLOGIES NOT AVAILABLE FOR STORMWATER.

THE GOVERNORS BELIEVE THAT THE CLEAN WATER ACT SHOULD CLEARLY AUTHORIZE THE USE OF SITE-SPECIFIC BEST MANAGEMENT PRACTICES TO CONTROL STORMWATER. BECAUSE STORMWATER IS GENERATED FROM A VARIETY OF SOURCES AND ACTIVITIES, BEST MANAGEMENT PRACTICES ARE THE MOST EFFECTIVE CONTROLS.

THE GOVERNORS ALSO BELIEVE THAT THE CLEAN WATER ACT SHOULD ALLOW STATES AUTHORITY TO USE ENFORCEABLE NONPERMIT APPROACHES TO CONTROL STORMWATER. THE MAGNITUDE OF THE BURDEN THAT STORMWATER PERMITTING PROGRAMS CAN HAVE ON THE STATES CANNOT BE OVERSTATED. IN WYOMING, WE CALCULATED THAT ISSUING INDIVIDUAL NPDES PERMITS TO ALL STORMWATER SOURCES WOULD MULTIPLY THE NUMBER OF PERMITS WE ISSUE TEN-FOLD. WE WOULD NEED TEN TIMES AS MANY STAFF AND ADDITIONAL FUNDING. USING GENERAL PERMITS AND BEST MANAGEMENT PRACTICES, WE WERE ABLE TO DO IT WITH EXISTING STAFF.

THE GOVERNORS BELIEVE THAT STATES MUST HAVE THE AUTHORITY TO PRIORITIZE STORMWATER CONTROL ACTIVITIES BASED ON RISK.

FINALLY, NGA RECOMMENDS A THREE-YEAR EXTENSION OF THE MUNICIPAL STORMWATER COMPLIANCE DEADLINE.

#### WETLANDS

WETLANDS IN THEIR NATURAL STATE SERVE IMPORTANT ECOLOGICAL AND SOCIOECONOMIC FUNCTIONS THAT ARE DIFFICULT TO REPLACE. DEVELOPMENT OF A WORKABLE NATIONAL POLICY TO PROMOTE CONSERVATION AND WISE MANAGEMENT OF THIS RESOURCE IS OF GREAT CONCERN TO THE GOVERNORS.

NGA POLICY SUGGESTS THAT NATIONAL POLICY SHOULD REFLECT SEVERAL IMPORTANT PRINCIPLES. TODAY I WOULD LIKE TO DRAW ATTENTION TO SIX OF THESE PRINCIPLES.

FIRST, THE GOVERNORS BELIEVE THAT LAND USE REGULATION SUCH AS THE WETLANDS PROGRAM IS MOST EFFECTIVELY ADMINISTERED AT THE STATE AND LOCAL LEVEL, AND THAT THE WETLANDS REGULATORY PROGRAM SHOULD FACILITATE STATE INVOLVEMENT THROUGH EITHER FULL STATE ASSUMPTION OR STATE PROGRAM GENERAL PERMITS.

THE GOVERNORS SUGGEST SEVERAL MEASURES TO ENCOURAGE MORE STATES TO ASSUME THE PROGRAM. THE GOVERNORS BELIEVE THAT:

1. Partial assumption -- defined as either assumption of the section 404 program in a limited geographical area, or assumption of some limited portion of section 404 regulatory responsibility -- should be an option for states.
2. Each state that assumes the program should negotiate a method of federal oversight appropriate to its circumstances. Oversight in the form of an annual program audit, eliminating EPA's authority to veto individual state permits, should be an option.

PAGE 5.

3. The federal government should establish clear goals for wetlands protection, and states should have some flexibility in designing programs to achieve these goals. Each state that assumes the section 404 program should negotiate specific program components appropriate to its circumstances.

THE GOVERNORS ALSO SUPPORT AN AMENDMENT TO THE CLEAN WATER ACT TO CLEARLY AUTHORIZE THE USE OF CORPS OF ENGINEERS-ISSUED STATE PROGRAM GENERAL PERMITS THAT SUBSTITUTE STATE PROGRAM AUTHORITY FOR THE FEDERAL PROGRAM. STATE PROGRAM GENERAL PERMITS ARE AN ALTERNATIVE METHOD FOR STATES TO ASSUME PARTIAL RESPONSIBILITY FOR WETLANDS REGULATION.

SECOND, THE WETLANDS REGULATORY PROGRAM MUST RECOGNIZE REGIONAL VARIANCE IN THE WETLANDS RESOURCE. THE NATURE OF THE WETLAND RESOURCE AND OF LAND USE PATTERNS VARIES DRAMATICALLY IN DIFFERENT PARTS OF THE COUNTRY AND MANAGEMENT POLICIES SHOULD BE TAILORED TO THESE VARIATIONS.

THIRD, THE GOVERNORS BELIEVE A DEFINITION OF WETLANDS AND DELINEATION CRITERIA THAT ARE SCIENTIFICALLY VALID, LEGALLY DEFENSIBLE, AND WORKABLE IN THE FIELD IS THE FOUNDATION OF A PRACTICABLE PROTECTION AND MANAGEMENT PROGRAM.

FOURTH, THE GOVERNORS ASSERT THAT REGULATORY POLICIES SHOULD INCLUDE A SEQUENTIAL APPROACH TO MITIGATION THAT BEGINS WITH AVOIDANCE OF ADVERSE EFFECTS ON WETLANDS AND MINIMIZATION OF UNAVOIDABLE ADVERSE EFFECTS, AND ALLOWS THE USE OF COMPENSATORY MITIGATION AS A LAST RESORT. AT THE SAME TIME, HOWEVER, POLICY MUST ALLOW REGULATORS FLEXIBILITY TO ACT RATIONALLY WEIGHING SOCIOECONOMIC FACTORS.

FIFTH, FEDERAL WETLANDS PROGRAMS SHOULD INVOLVE A SUBSTANTIAL RESEARCH COMPONENT TARGETED IN PARTICULAR TOWARD DEVELOPING IMPROVED METHODS OF CREATING AND RESTORING WETLANDS AND ACCURATE METHODS OF ASSESSING WETLAND FUNCTIONS AND VALUES. WE NEED BETTER SCIENCE ON THESE IMPORTANT QUESTIONS.

SIXTH, THE REGULATORY PROGRAM SHOULD BE COMPLEMENTED WITH A NONREGULATORY PROGRAM. THE GOVERNORS EMPHASIZE THE VALUE OF WETLANDS RESTORATION AND CREATION THROUGH COOPERATIVE INITIATIVES BETWEEN GOVERNMENT AND THE PRIVATE SECTOR. THE NORTH AMERICAN WATERFOWL MANAGEMENT PLAN, ADMINISTERED BY THE FISH AND WILDLIFE SERVICE, AND WETLANDS CONSERVATION PROVISIONS OF THE 1990 FOOD SECURITIES ACT ARE SUCCESSFUL EXAMPLES OF SUCH INITIATIVES.

IN ADDITION, NGA POLICY ADDRESSES SOME SPECIFIC MANAGEMENT ISSUES INCLUDING WETLAND CLASSIFICATION, MITIGATION BANKING, REGULATION OF MANAGED WETLANDS, AND COMPENSATION OF PRIVATE PROPERTY OWNERS.

- o NGA OPPOSES IMPOSITION OF A NATIONAL CLASSIFICATION SYSTEM, BUT CLASSIFICATION SYSTEMS TAILORED TO INDIVIDUAL WATERSHEDS COULD BE USEFUL IN DEVELOPING REGIONAL AND LOCAL RESOURCE MANAGEMENT PLANS.
- o THE GOVERNORS BELIEVE MITIGATION BANKING MAY BE A USEFUL TOOL GIVEN CAREFUL MANAGEMENT. IN WYOMING WE HAVE THE TECHNICAL EXPERTISE AND RESOURCES TO INITIATE, DEVELOP AND ADMINISTER WETLAND BANKS. HOWEVER, OUR EFFORTS TO DATE HAVE BEEN FRUSTRATED BY A LACK OF COORDINATED AND CONSISTENT FEDERAL POLICY. FEDERAL POLICY ON BANKING COULD ALLOW INFRASTRUCTURE IMPROVEMENTS TO PROCEED WHILE PROVIDING EFFECTIVE AND EFFICIENT WETLANDS MITIGATION.

PAGE 6.

- o NGA POLICY STATES THAT WETLANDS CREATED AND MAINTAINED SOLELY FOR USE IN RESOURCE MANAGEMENT, FOR EXAMPLE, FOR STORMWATER ABATEMENT OR WATERFOWL PRODUCTION, SHOULD BE EXEMPT FROM REGULATION UNDER SECTION 404.
- o FINALLY, THE GOVERNORS OPPOSE MANDATORY COMPENSATION OF PROPERTY OWNERS FOR WETLANDS REGULATION. THIS ISSUE IS APPROPRIATELY ADDRESSED IN THE COURTS, WHICH HAVE ESTABLISHED SOUND CRITERIA FOR DETERMINING WHEN A REGULATORY TAKING HAS OCCURRED.

THAT CONCLUDES MY WRITTEN TESTIMONY. MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE, THANK YOU FOR THE OPPORTUNITY TO TESTIFY TODAY. I AM HAPPY TO ANSWER ANY QUESTIONS AT THIS TIME.

**D-6. WATER RESOURCE MANAGEMENT****6.1 Principles**

- 6.1.1 A Systematic Approach to Management.** Historically, this nation has approached water resources as isolated and categorical, with programs designed specifically for certain waters depending upon where they are found. Now we know that our water resources are part of an interrelated hydrologic and environmental system that demands systematic management. The Governors believe the future demands a new model for managing water resources, based on well-defined geographic units such as basins or watersheds, that recognizes all the interconnections within the watershed that define the hydrologic cycle in that area, including surface and groundwaters as well as wetlands. The management of any watershed should reflect all of the things that make it unique, including specific precipitation patterns, topography, soil and geological characteristics, and land use.

A systems management approach would involve the development and operation of a comprehensive water resource management program -- though ultimately it need not be limited to water resources -- within the specific geographic area encompassing the basin or watershed. Components of such a comprehensive program would include water supply, water quality, water conservation, flood protection, land use, and protection of fish and wildlife resources.

There are few, if any, significant scientific barriers to the transition from our current collection of categorical programs to this kind of comprehensive, systems-based approach to water resource management. However, the Governors recognize that there are significant institutional obstacles, and that the new model needs to be developed in an evolutionary fashion. It will require unprecedented cooperation among many state and local entities, among state and federal agencies, and between states in the case of watersheds crossing state lines.

- 6.1.2 Goals.** The Governors reaffirm their commitment to the restoration and maintenance of the chemical, biological, and physical integrity of the nation's waters and water ecosystems and the protection of its availability and acknowledge that the nation's water and related resources are increasingly central to our economic and environmental well-being. The nation's strategy for achieving these objectives should remain founded upon a vigorous federal-state partnership that recognizes that limited resources for water resource management demand enhanced intergovernmental cooperation.

- 6.1.3 State Responsibility.** The primary responsibility for water resource management is properly vested with the states, including pollution prevention, development of water quality standards and planning, and priority setting. State laws regarding water rights and allocations must be preeminent to federal laws and regulations and must be binding on federal agencies, including the Federal Energy Regulatory Commission. The federal government should assert no claim to the existence of nonreserved federal water rights. Further, federal activities within states must be consistent with state-developed water management plans, and water quality standards and programs.

The implementation of water quality standards should be designed to ensure continued progress toward the fishable, swimmable goal of the Clean Water Act. The Governors support state and federal efforts to give special protection to outstanding national resource waters.

- 6.1.4 Federal Responsibility.** The federal government should maintain its commitment to helping the states achieve their water quality goals through the coordination of federal programs, provision of technical and financial assistance, research and development, oversight of state programs in the form of periodic program audits, and enforcement in cases in which the state has failed to act after notice and opportunity to respond or if federal assistance is requested by any state. Federal programs should be designed so that they may be easily assumable by states.

As our government policies transition to a systems-based, comprehensive approach to managing water resources, we must introduce increased flexibility and latitude into current programs so that cross-categorical management of resources can flourish.

## 6.2 Grant Funding

6.2.1 **Preface.** The states believe that in order to maintain the substantial progress made over the past twenty years in implementing the mandates of the Clean Water Act, to ensure continued progress toward resolving remaining problems, and to begin to transition to a watershed-based water resource management scheme, Congress must provide adequate resources to finance water programs, and should allow states increased flexibility in the use of water program money.

6.2.2 **Recommendations.** Congress should allow states substantial flexibility in the use of grant funds other than State Revolving Loan Fund (SRF) capitalization grants by eliminating set-aside requirements, permitting states to shift grant funds between programs, and allowing the use of consolidated grant applications.

Congress should establish a national water discharge permit fee system, which authorizes states to collect fees to support their water program-related costs. Such fees should not justify reduction in federal support of water quality programs. If a state fails to develop an appropriate fee system, EPA should assess and collect fees in that state. States that are already collecting discharge fees for water quality protection programs should be given credit if fees are used for a water quality protection purpose.

While states recognize that current levels of support are inadequate, states urge Congress to appropriate, at a minimum, all authorized grant monies.

## 6.3 Clean Water Infrastructure

6.3.1 **Preface.** The states applaud the initial success of the State Revolving Loan Fund and believe that the SRFs should remain the mechanism for wastewater infrastructure funding.

However, state water management needs are evolving, and the SRF program must be revised to accommodate changing state and national priorities. As states successfully address traditional infrastructure needs, they turn attention toward new issues, including the refurbishment of aging facilities; the special needs of financially disadvantaged small communities; and "second-tier" pollution problems highlighted by the 1987 Clean Water Act amendments and toward creative management techniques.

The Governors emphasize the magnitude of new responsibilities imposed on states under the 1987 amendments, and the importance of providing access to SRF funds to a broader population. States also stress the importance, in an era of tight funding constraints, of maximizing efficiency in the use of available resources.

6.3.2 **Recommendations.** In order to protect the nation's existing, substantial investment in wastewater treatment and to ensure continued progress toward meeting the goals of the Clean Water Act, the Governors make the following recommendations.

- ~~Congress should appropriate level funding of at least \$2.1 billion annually for state revolving loan funds through fiscal 1994.~~
- Given the magnitude of remaining needs, especially those associated with the unfunded requirements of the 1987 Clean Water Act amendments, and additional needs identified since enactment, Congress should extend the federal commitment to provide capitalization grants for SRFs of at least ~~\$2.1~~ <sup>\$2.5</sup> billion per fiscal year through the year 2000.
- Statutes and regulations governing the administration of the SRF should be amended to make the SRF program more efficient, and SRF loans more accessible and competitive with market sources.
- Congress should recognize the special needs of small communities and provide assistance through appropriate amendments to SRF requirements.
- While Congress should finance water infrastructure needs strictly through the SRF program, grants may be appropriate for non-infrastructure water quality initiatives.

#### 6.4 Point Sources

6.4.1 **Preface.** Significant progress has been made in the last decade toward achieving the nation's clean water goals. The improvements have come primarily through control of emissions from "point sources." The system of permitting discharges is the cornerstone of the effort to control pollution for point sources.

6.4.2 **Recommendations.** The following improvements should be made to the permit system.

- Congress should require EPA to update the technology-based requirements of the Clean Water Act.
- Ten-year NPDES permits should be authorized provided there is an option to reopen the permit at any time, and rollover renewal of unchanging permits should be authorized.
- Any new requirements for additional permit conditions, specific numeric limits, or biologically based toxicity assessment techniques should be developed in consultation with the states. Congress should in no way inhibit the states from proceeding expeditiously to implement biomonitoring and bioassay techniques.
- Combined sewer overflows (CSO) controls should be driven by water quality impacts and a combination of state-developed best management practices (BMPs) and other measures, including end-of-pipe technology controls or effluent standards where dictated by water quality impacts.
- States should be able to determine appropriate permit conditions for controlling CSOs based on site-specific conditions, including water quality impairments caused by CSOs, cost-effectiveness of controls, and other criteria deemed relevant by the state.

#### 6.5 Nonpoint Sources

6.5.1 **Preface.** The Governors recognize that the nation's water quality objectives cannot be met solely through the control of point sources of water pollution. A majority of our existing water quality problems stem from nonpoint sources (NPS) of pollution. Reducing nonpoint pollution demands that careful attention be paid to managing land uses to protect water quality. Land use decisions affect large segments of society in many ways. Because NPS control must take into account local economic and geographic conditions, states should retain primary responsibilities for nonpoint source pollution programs.

The Governors also recognize that several examples of federal-state cooperative efforts exist at the local, state, and regional levels, like the Colorado River Basin Salinity Control Program. These programs serve as models for nonpoint source pollution control and deserve continued federal support and funding.

6.5.2 **Recommendations.** Following is an outline of an NPS system that could assist states in managing NPS pollution, for which the Governor would certify consistency with the law.

- Congress should authorize and appropriate at least \$400 million for state NPS programs from 1992 to 1996. Congress should also direct EPA to work with the states to conduct a needs assessment to determine the costs of controlling NPS pollution in the future. EPA should also be directed to help states determine what constitutes significant progress and to define uniform methods and criteria for determining how progress should be measured. Appropriations beyond 1996 should be based on the needs assessment.
- States should be required to identify and prioritize watersheds in need of nonpoint source management.
- States should be required to establish nonpoint source management goals for these watersheds and define best management practices appropriate to achieving such goals. This process should include local involvement.

- States should establish schedules for implementing BMPs in each priority watershed and identify milestones to measure progress toward meeting specified goals. States should require implementation of appropriate BMPs in targeted watersheds or make other appropriate adjustments in their Section 319 plans if, after sufficient time, significant progress is not made toward achieving the goals.
- A certification process should be developed to ensure that federal programs, activities, and land use decisions in priority watersheds, including those pertaining to grazing, forestry, minerals development, and agricultural cost share programs, are consistent with state NPS plans.

## 6.6 Groundwater

6.6.1 **Preface.** Groundwater provides one-half of the nation's drinking water supplies -- 97 percent of the drinking water for rural areas -- and maintains many valuable ecosystems. Because groundwater may be extremely difficult to restore once it is contaminated, the resource needs strong protection.

However, substantial federal authority exists to protect groundwater, and the Governors do not believe that new federal authority is needed at this time. Rather, it should be the policy of the United States to use its existing authorities in a coordinated fashion to protect the physical, chemical, and biological integrity of the nation's groundwaters to ensure that they are not degraded or in any way harmful to human health and the environment. Because groundwater resources are highly variable locally, states with their local units of government have and must maintain the primary responsibility for managing them, in partnership with the federal government.

6.6.2 **Recommendations.** The partnership for groundwater protection should be characterized by:

- State development and implementation of programs responsive to their groundwater protection needs. It is recommended that state programs include classification of aquifers, specification of control requirements for sources of groundwater contamination, and authority for state and local land use protection.
- Federal provision of financial and technical assistance to state and local governments. In particular, the federal government should develop criteria by which states may judge the human health, environmental, and ecological risks associated with known groundwater pollutants. In addition, the federal government should require minimum national performance standards for important sources of groundwater contamination.
- Local efforts to develop and implement land use protection programs. These programs should be consistent with relevant state authorities and policies.

## 6.7 Stormwater

6.7.1 **Preface.** Stormwater generated by runoff from streets, parking lots, buildings, and land associated with residential, commercial, and industrial developments is a significant source of pollution that may prevent water bodies from meeting the standards for their designated uses.

The Governors believe that reducing stormwater contamination is critical to achieving our nation's water quality goals. Unfortunately, our current statutory approach fails to reflect the contrasts between stormwater systems and typical point sources; the widely varying benefits and costs that a given level of stormwater control represents to different municipal governments; the difficulty of using the NPDES program to control all of the nation's stormwater dischargers; and the administrative costs to states for implementing the stormwater program.

6.7.2 **Recommendations.** To ensure that the national strategy for controlling contaminated stormwater is effective, equitable, and efficient, the Governors recommend the following changes in the stormwater program:

- Clear authorization of the use of site-specific best management practices and other management measures as well as uniform end-of-pipe control technologies and effluent guidelines for stormwater control requirements.

- Unambiguous authority for states to utilize enforceable nonpermit approaches that achieve levels of stormwater control equivalent to EPA's current permit program in their impact on water quality, or to administer the stormwater program in the same manner as they administer the pretreatment program.
- Authorization for states to prioritize stormwater control activities based on water quality, cost-effectiveness, and other criteria deemed relevant by the state.
- Extension, by at least five years, of deadlines for compliance with EPA's stormwater permit application requirements contained in the Clean Water Act.

## 6.8 Drinking Water

6.8.1 **Preface.** The protection of public health through the regulation of drinking water quality should continue to be a priority of government. The Governors recognize the complex relationship between the management of surface and groundwater resources and federal laws relating to groundwater cleanup.

6.8.2 **Federal Role.** The Governors believe that the appropriate federal role in protecting drinking water includes:

- Establishing maximum contamination levels and national drinking water regulations;
- Conducting research related to the development of standards and treatment technologies;
- Providing technical and administrative information;
- Conducting baseline sampling and publishing guidelines for development of state drinking water monitoring plans that include monitoring guidelines set for classes of substances based on the likelihood of threat presented within each state;
- Providing funding for state program activities, sampling, monitoring, inspection, and technical assistance for state drinking water programs and underground injection control programs;
- Coordinating federal activities that affect groundwater quality; and
- Continuing an underground injection control program.

6.8.3 **State Role.** The appropriate state role includes:

- Implementing safe drinking water programs;
- Managing surface and groundwater resources; and
- Prioritizing monitoring and standard setting based on greatest threats to drinking water quality.

6.8.4 **Recommendations.** The Governors reject proposals that condition primacy of state control on the provision of technical assistance to classes of water purveyors, impose facility siting requirements, or preempt state enforcement.

The Governors also oppose proposals to expand the definition of drinking water to include all underground sources that may be rendered fit for human consumption through treatment technologies not yet developed.

## 6.9 Wetlands

6.9.1 **Preface.** Wetlands in their natural state serve important ecological and socioeconomic functions that are either costly or impossible to replace. They provide habitat for wildlife, mitigate flooding, and maintain water quality by filtering out sediments and other pollutants.

The Governors recognize the need for improved protection of the nation's wetlands and support development of a comprehensive national wetlands protection strategy to promote preservation, conservation, and wise management of this vital resource. The Governors believe a comprehensive strategy should involve a broad range of both regulatory and nonregulatory programs, and a wetlands research program with key emphasis on developing effective methods of wetlands restoration and creation and of assessing the functions and values of wetlands.

The Governors believe this comprehensive strategy should reflect five general principles.

- First, protection efforts should be coherent and coordinated to make the most efficient use of scarce resources and minimize inconsistency among federal, state, and local programs.
- Second, wetlands management should be integrated with other resource management programs such as flood control, allocation of water supply, protection of fish and wildlife, and stormwater and nonpoint source pollution control.
- Third, wetlands delineation criteria and management policies should recognize the significant regional variance in the resource. Many wetlands functions and values derive from the location of wetlands in the watershed and the relationship of wetlands to other land and waters. Management policies must be tailored to local hydrologic and ecological conditions.
- Fourth, the Governors note that land use regulation is traditionally a state and local function and believe that increased state involvement in wetlands protection programs will further all of the above three principles, and that the regulatory program should be designed to facilitate state assumption.
- Finally, the Governors believe the national strategy should recognize the unique situation encountered by the state of Alaska. Alaska has a tremendous amount of wetlands -- more than the rest of the United States combined -- and wetlands constitute as much as 75 percent of the landscape. Many are already in public ownership, and there has been a low historic loss rate -- less than one-tenth of 1 percent. Because of certain geographic characteristics unique to the state (it is arctic and subarctic, with development constrained to limited geographic areas), policies and procedures that are reasonable in the coterminous states are not always applicable in Alaska. Yet needs do arise that may impact on Alaska's wetlands resource.

In lieu of direct application of all these following recommendations in Alaska, the Governors recommend that the appropriate government agencies and stakeholder groups in Alaska work cooperatively to develop regional wetlands strategies that accommodate sustainable wetlands protection and sustainable economic growth for the state.

- 6.9.2 Goals.** The Governors believe the goal of the national wetlands protection strategy should be no net loss of wetland resources. The Governors recommend that Congress include in the Clean Water Act a national wetlands protection goal to achieve no net loss of the nation's remaining wetlands base, as defined by acreage and function, and to restore and create wetlands where feasible to increase the quantity and quality of the nation's wetlands resource base.

This goal does not imply that individual wetlands will in every instance be untouchable or that the no net loss standard should be applied on an individual permit-by-permit or acre-by-acre basis -- only that the nation's overall wetlands base should reach equilibrium between losses and gains in the short run and increase in the long term. The public must share with the private sector the costs of restoring and creating wetlands to achieve this goal.

The Governors recognize that the goal may have to be implemented at different rates in various regions of the country to reflect regional wetlands needs, conditions, and types.

However, the goal does not imply that wetlands losses in one state or region of the country can be balanced with gains in other, distant regions. Moreover, the Governors recognize that this goal can be most effectively met with policies that assert a preference for avoidance of wetlands alteration.

- 6.9.3 Definition of Wetlands.** The Governors stress that the definition of wetlands and delineation criteria must be workable and scientifically valid, and should recognize regional variance in the resource. The Governors make the following recommendations.

- Congress should write into the law the definition of wetlands currently included in EPA's Clean Water Act Section 404(b)(1) guidelines -- "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions."

- Congress should not legislate specific wetlands delineation criteria, but should establish a procedure for administering agencies to develop regional delineation guidelines in consultation with the states and an independent scientific advisory committee. The Federal Manual for Delineating and Identifying Wetlands should be regionalized to scientifically define wetlands based on regional variations.
  - Efforts should continue to ensure that agencies at all levels of government use equivalent definitions for regulatory purposes and to ensure that all staff are provided with appropriate training for implementing field delineation techniques.
- 6.9.4 **The Regulatory Program.** The Governors urge the administration to consider changes to Clean Water Act Section 404 to make the program more workable. The Governors also make the following specific recommendations.
- 6.9.4.1 **The Scope of Regulation.** The Governors hold that the scope of regulation in federal and state programs should be expanded to explicitly address the following activities in wetlands: dredging, filling, removal or excavation of soils, drainage or flooding, and destruction of plant life or habitat.
- The Governors also believe that the scope of regulation should be restricted, under certain circumstances, in application to artificial wetlands. Specifically, the Governors believe that:
- Artificially induced wetlands such as those resulting from and incidental to ongoing agricultural practices, not used for mitigation of wetlands loss, should not be counted in the nation's wetlands base.
  - Wetlands created and maintained solely for use in resource management, such as for stormwater abatement, should be exempt from regulation as long as they are used and managed for their intended purpose. The owner or manager of such a managed wetland should be under no obligation to ensure the long-term persistence of wetlands functions and values. Wetlands created and managed for waterfowl production should be exempt from regulation for operation and management activities, but should remain subject to regulation for conversion to non-wetlands because waterfowl depend on consistent availability of habitat.
- 6.9.4.2 **Mitigation Policy.** Mitigation should be an essential component of wetlands management, and Congress should include a statement of mitigation policy in the Clean Water Act.
- The Governors believe that regulatory policies should include a clear preferred sequence of mitigation options that begins with avoidance of adverse impacts on wetlands and the reduction of unavoidable adverse impacts and allows the use of environmental compensation only as a last resort, while allowing regulators sufficient flexibility to approve practical options that provide the most protection to the resource and that balance the effects of such actions on the total human environment, recognizing socioeconomic factors. The Governors recognize that definitions of avoidance of adverse impacts and reduction of unavoidable adverse impacts must be tailored to regional circumstances.
- The Governors emphasize that mitigation will work only with provisions for strict enforcement, long-term financing, and careful monitoring of mitigation projects to ensure their success.
- The Governors support the use of mitigation banking provided that: 1) mitigation banks are used in a manner consistent with the sequencing requirement, strictly to mitigate unavoidable wetlands impacts; 2) impacts are mitigated on-site when possible; 3) banks are located in the same watershed or ecological region as the wetlands impacts they mitigate; and 4) banks provide in-kind replacement of wetlands functions and values lost.
- 6.9.4.3 **Wetlands Classification Systems.** The Governors oppose imposition of a national classification system, but believe that classification systems tailored to individual watersheds may be a useful tool in developing regional and local resource management plans.
- 6.9.4.4 **Compensation of Property Owners.** The Governors believe that interpretation of the Fifth Amendment of the Constitution concerning the taking of property by government is the appropriate province of the courts, and that legislative requirements are not warranted. The Governors believe that Congress should not legislate a definition of compensable taking of private property through the Clean Water Act or otherwise. A statutory definition of a compensable taking would have far-reaching implications for state and local zoning, land management, and public health laws of all kinds.

- 6.9.4.5 Delegation of Authority Among Federal Agencies.** The Governors support streamlining the permitting process. However, the Governors stress that each federal agency responsible for the implementation of wetlands programs currently has a specific interest in the protection of the resource, and makes a unique contribution to the program. Concentration of authorities in one federal agency would necessitate restructuring of that agency and reallocation of resources.
- The Governors may support delegation of Clean Water Act Section 404 authorities to one federal agency after a comprehensive study of the impacts of concentration, and development of a plan for the necessary reorganization. In any case, the role of each federal agency should be more clearly defined, and replication of responsibilities should be reduced.
- 6.9.5 Nonregulatory Approaches to Protection.** The Governors stress that a national wetlands protection strategy must involve nonregulatory programs, an essential complement to the regulatory program. The Governors support continued and additional emphasis on resource management planning; programs to promote wetlands restoration and creation; development of tax incentives to encourage wetlands protection; public acquisition of wetlands; public education and management outreach programs; wetlands mapping and tracking systems; and efforts to reduce incentives to wetlands conversion.
- 6.9.5.1 Resource Management Planning.** The Governors believe that regional resource management planning is a valuable mechanism to recognize regional variance in wetlands resources, and to integrate wetlands protection with other resource management efforts.
- The Governors believe that Special Area Management Planning, as currently authorized under the Coastal Zone Management Act, should be authorized under the Clean Water Act, and that states should have flexibility to use funds authorized under Clean Water Act Sections 319, 106, 205(j), and 604(b) to support wetlands management planning.
- 6.9.5.2 Wetlands Restoration and Creation.** Congress should establish a national strategy to coordinate and promote restoration of degraded wetlands systems involving participation of federal agencies, state and local government, and the private sector. The North American Waterfowl Management Plan, administered by the Fish and Wildlife Service, and wetlands conservation provisions of the 1990 Food Securities Act serve as potential models for such a strategy.
- The Governors support provisions of the 1990 Food Securities Act that encourage wetlands protection. In particular, the Governors encourage Congress to fund the Wetland Reserve Program to its full authorized level.
- 6.9.5.3 Tax Incentives.** Congress should review the federal tax code to identify opportunities to establish incentives to encourage wetlands protection.
- 6.9.5.4 Public Acquisition.** Acquisition programs at all levels of government, both alone and in partnership with the private sector, should accelerate acquisition of valuable wetlands.
- 6.9.5.5 Public Education.** Public education focused on the value of wetlands and the structure of regulatory programs will increase public support for the program and ability to predict the outcome of regulatory decisions. The Governors support expansion of federal, state, and private education and outreach programs.
- 6.9.5.6 Mapping.** The Governors support continuation and improvement of current national wetlands inventory mapping efforts as well as efforts to disseminate such maps to landowners and to those responsible for wetlands and land use planning.
- 6.9.5.7 Reduction of Incentives to Conversion.** The federal government should conduct a thorough assessment to identify key federal programs causing wetlands degradation.
- Local governments should examine their full range of development controls to identify and modify those that intentionally promote wetlands conversion.
- States should identify opportunities to reduce unintentional incentives for wetlands conversion.
- 6.9.6 State Programs.** The Governors believe that increased state involvement in wetlands policymaking and program administration will increase program efficiency and efficacy. States can effectively integrate wetlands protection with other state-administered water programs and can tailor wetlands programs to unique regional circumstances.

**6.9.6.1 State Assumption.** The Governors assert that the Clean Water Act should encourage state assumption of the Section 404 wetlands regulatory program, an excellent opportunity to simplify and consolidate permitting procedures.

While it is possible for states to assume management of the Section 404 program, few states have applied and only one state has received full program authorization. The lack of federal funding for assumed state programs and other conditions of assumption that are perceived as rigid are the primary reasons for the lack of state interest. Therefore, the Governors make the following recommendations.

- The federal government should establish clear goals for wetlands protection. In the context of a resource management plan approved by EPA, states should have flexibility in designing programs to achieve these goals, tailoring management policies to local hydrologic and ecological conditions.
- States should be allowed to assume discrete and clearly identifiable portions of the Section 404 regulatory program as they develop the capability to do so, rather than requiring the entire program to be delegated at one time.
- Qualified states that have effective processes for coordinating their review with the Corps of Engineers for permits that may affect navigable waters should be allowed to assume all Section 404 responsibilities, including those in navigable waters and adjacent wetlands. The corps would reserve its rights to protect navigational servitude and national defense, but would work with the states to confine its role to interstate and national issues.
- Each state receiving delegation of the Section 404 program should negotiate a method of federal oversight appropriate to its circumstances. Oversight in the form of an annual program audit should be a negotiable option. Oversight on a sliding scale should be permitted.
- Federal agencies should temporarily loan employees to states assuming the Section 404 program to help train state staff.
- The corps should be encouraged to issue state program general permits, and to issue general permits for geographical areas as well as for classes of activities. State program general permits are an alternative method for states to assume partial responsibility for wetlands regulation, and should be explicitly sanctioned.

**6.9.6.2 Intergovernmental Coordination.** To facilitate effective intergovernmental coordination, the Governors recommend that federal agencies responsible for wetlands regulation jointly establish a state-federal coordinating committee to develop and evaluate new wetlands management techniques and cooperative state, federal, and local wetlands programs.

**6.9.6.3 State Wetlands Conservation Plans.** State and local governments and regional agencies, with the financial and technical support and cooperation of the relevant federal agencies, should develop and implement state wetlands conservation plans and outline appropriate state and regional strategies. The Governors recommend that Congress encourage EPA to continue support for state plans and provide funds for their development and implementation.

**6.9.7 Government Compliance.** All levels of government must seek to avoid wetlands alterations in projects that they construct, maintain, sponsor, or support. While significant improvements have been made in methods and procedures for evaluating the effects of programs on wetlands, additional actions are appropriate. Therefore, the Governors make the following recommendations.

- Congress should require federal consistency with state wetlands conservation plans and programs.
- Federal and state governments should require or initiate mitigation for the direct and indirect wetlands alterations caused by projects that they construct, maintain, sponsor, or support.
- EPA should establish procedures for verifying compliance with wetlands mitigation provisions identified in federal environmental impact statements.
- Federal agencies should recognize the costs of satisfying state wetlands mitigation requirements established by state statute as legitimate project costs in any project subject to federal cost sharing.

- Congress should establish wetlands restoration and creation as part of the mission of the Corps of Engineers, the Bureau of Reclamation, the Soil Conservation Service, the Federal Highway Administration, and other federal agencies as appropriate.

#### 6.10 Water Conservation

Water conservation must be a fundamental consideration in developing water management programs. The issue is both economic and environmental. The economic and environmental impacts of water conservation vary by region and are often site-specific. As part of their total water management program, states should include a component for evaluating the true benefits and costs of conservation. In designing water programs and projects and developing planning and evaluation criteria, states should consider water conservation.

#### 6.11 Floodplain Management

Effective floodplain management is a federal-state-local partnership. The Governors emphasize that efforts to mitigate flood damage to existing development must be continued and strengthened.

Wise management of flood-prone land is necessary to limit the exposure to flood damage. Additionally, natural and relatively undisturbed floodplains provide several beneficial functions associated with moderation of flooding, retention of floodwater, and the reduction of erosion and sedimentation. Measures to protect these areas also support other worthwhile objectives like wetlands preservation, groundwater recharge, and the maintenance of fish and wildlife habitat.

The primary tool necessary for effective floodplain management is the federal Flood Insurance Rate Map. This map delineates lands that would be subject to flooding by the 100-year frequency flood event. Automating this large database and keeping it current must be continuing federal responsibilities.

The Governors believe that it is critical to reduce the potential for existing and future flood damage through the implementation of comprehensive floodplain management programs, and recommend:

- At a minimum, continued federal technical and financial assistance for state and local implementation of feasible and cost-effective nonstructural flood damage mitigation measures.
- Improved federal programs to develop, maintain, and automate floodplain mapping, and provide information critical to reducing the human and economic effects of flooding.
- Federal minimum erosion management standards for regulation of coastal lands to minimize risks to public safety, reduce future property damage, and mitigate existing hazards.
- Federal incentives, such as reduced flood insurance rates, to encourage enhanced floodplain management and state and local measures to protect natural and beneficial floodplain functions.
- Efforts to achieve multiple natural resource and development objectives through comprehensive river and coastal management.
- Coordination of federal programs and policies to assure that floodplain management and damage mitigation objectives are met.
- Federal cost-sharing requirements should fully credit non-federal contributions to all phases of structural and non-structural projects (planning, design, construction, etc.), and should be based on local ability to pay.

Adopted August 1991; revised February 1992.

President Bill Clinton  
The White House  
1600 Pennsylvania Avenue  
Washington, D.C. 20500

Dear Mr. President:

The Governors appreciate your attention to the states' critical need for water infrastructure financing, and strongly support your proposal to provide \$845 million to the Clean Water Act state revolving loan funds (SRFs) as an economic stimulus in fiscal year 1993; to extend funding for SRFs through fiscal year 1997; and to finance a new revolving fund for drinking water. We urge you to consider the following revisions to your proposal.

The Governors recommend a minimum fiscal year 1994 appropriation of a full \$2 billion to the Clean Water Act SRFs and a full \$1 billion for the drinking water revolving fund. The \$845 million in proposed stimulus spending should be in addition to a \$2 billion fiscal year 1994 SRF appropriation. Stimulus spending should represent a real increase in funding, not merely accelerated spending of fiscal year 1994 funds in fiscal year 1993.

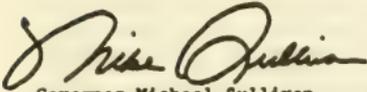

We believe a \$3 billion annual funding level for wastewater and drinking water treatment is clearly justified by documented needs in both programs. It is important to establish a \$3 billion baseline in fiscal year 1994 in order to ensure sufficient appropriations in fiscal years 1995-97.

Also, the Governors believe that all wastewater infrastructure should be funded through the Clean Water Act SRFs. SRFs provide sustainable long-term funding, have low administrative costs and a 50 percent faster payout rate than categorical grants, and provide incentives to local government to reduce costs and develop appropriate user fee systems. We stress that any continuation of current construction grant funding to large coastal cities should be in addition to, not an earmark in, a \$2 billion fiscal year 1994 SRF appropriation.

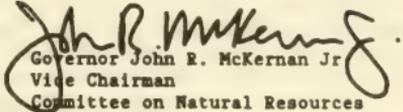

President Bill Clinton

**Association of State and Interstate  
Water Pollution Control Administrators (ASIWPCA)**

**CLEAN WATER ACT REAUTHORIZATION  
RECOMMENDATIONS**

Mr. Chairman, members of the Subcommittee, I am Roberta (Robbi) Savage, Executive Director of the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). ASIWPCA is, as you know, the national organization of State officials who implement the Clean Water Act on a daily basis. All 50 States are members of ASIWPCA, along with 6 interstate commissions, the trust territories and the District of Columbia. Our Association is committed to the environmental objectives set forth in the law, and we appreciate the opportunity to appear before you today to present the States' Clean Water perspective.

Since the laws initial passage in 1972 States have gained considerable experience in dealing with the serious water quality problems confronting the nation. Tremendous strides have been made in the cleaning up and protecting of the environment. Our recommendations based on the positions of the states are premised on the following principles:

The Clean Water Act is fundamentally sound and while some modification of the law is necessary, wholesale, changes as a part of the reauthorization is not necessary or desirable. The most serious impediments to the Clean Water Act goals are:

- \* The lack of adequate Federal funding and State flexibility.
- \* Significant delays in Federal agency guidance and policy, coupled with serious delays in allocation of appropriated dollars pose major problems for the States.
- \* The need for adequate time to carry out the 1987 Water Quality Act Amendments. With inadequate funding and technical resources, coupled with delay in policy and regulatory guidance from USEPA, States have found themselves behind the implementation schedules as dictated by Congress.

To address these concerns, ASIWPCA calls on the House to reinforce the position that:

1. States must continue to have the lead role in program development and management.
2. New Federal mandates must be accompanied by increased State flexibility and adequate funding.
3. Existing resources need to be utilized more efficiently and effectively to assure the desired environmental results.
4. The need to define the continuing Federal funding role in infrastructure financing after 1994.

Having had the opportunity to work closely with this committee for the past two decades, our formal positions (attached) have been presented for the record. For the purposes then, of this discussion, I would like to focus primarily on:

- I. State management of the national program
- II. State Revolving Loan Fund
- III. Water Quality Standards
- IV. Pollution Prevention and effluent guidelines
- V. Nonpoint source management
- VI. Watersheds Management
- VII. Stormwater

## I. STATE MANAGEMENT OF THE NATIONAL PROGRAM

The Clean Water Act recognizes through delegation under Section 106, that water pollution control programs are administered more efficiently and effectively at the State level. A crisis however, is looming. With the passage of the 1987 amendments, major program responsibilities were authorized, yet unfunded. Specifically I refer to the mandates for stormwater, toxics and nonpoint sources, etc. Because of these unfunded requirements, there is now a serious \$400 Million shortfall in needed funding.

The Section 106 should therefore be significantly increased, then allocated in its entirety to the States. Any Federal match requirement should be phased in over 3 years. Any "level of effort" (LOE) should be based on the current level of State general appropriations in terms of dollars, and maintained unless there is an across-the-board State budget reduction.

In support of the comprehensive management approach (e.g. basin/watershed programs), the Act should eliminate the proliferation of entitlement grants, set-asides and earmarks by funding special projects as a part of Section 106. Congressional priorities should be recognized and incorporated into negotiated State work plans, with flexibility to support regional/State priorities to achieve environmental results.

The Act should provide a Federal permit fee structure with exemptions for State programs with equivalent total receipts. USEPA should impose fees only if States are unable or unwilling to do so. Fees assessed by States should be retained for broad use within the context of a States Clean Water Program. States should be allowed to use fees to meet their 106 matching requirements.

Finally, the current sensitivity toward interaction with the Federal Government has been a significant inhibitor to the operations of State/USEPA as co-regulators. Therefore, ASIWPCA and State activities with USEPA need to be clearly recognized, by law, as consistent with the Federal Advisory Committee Act (FACA) and the Federal Grants and Cooperative Agreements Act to assure adequate and meaningful implement action of the Clean Water Statute.

## II. STATE REVOLVING LOAN FUND (SRF)

States were closely involved in the development of the SRF and we appreciate the leadership of this committee and Subcommittee in assuring that the States concept became legislative reality. All 50 states

- |   |  |
|---|--|
| <ol style="list-style-type: none"> <li>1. Delete Section:</li> <li>2. Delete the word "proportional" in Section 204(b)(1), User Charge Requirements.</li> <li>3. Delete mandatory requirement to perform value engineering in Section 218, Cost Effectiveness.</li> </ol> | <ul style="list-style-type: none"> <li>* 201(g)(1) on the 20% Limitation</li> <li>* 201(g)(5) on Innovative/Alternative Analysis</li> <li>* 201 (6)(g) on Recreation/Open Space Requirements</li> <li>* 513 on Labor Standards Provisions</li> </ul> |
|---|--|

Land Eligibility: Acquisition of land, easements and rights of way should be an eligible SRF cost. The exclusion (a holdover from the defunct grants program) is an impediment to successful program management.

Loan Amortization Period: The 20-year loan repayment period should be extended to 30 years generally and up to 40 years in small communities or in financial hardship situations. The extension is needed to make the SRF more competitive and reduce the need to use deep discount interest rates which can erode "Fund Corpus".

Federal Oversight: Recognizing the intent of Congress to create a "State" managed program, it is necessary to keep federal oversight and involvement to a minimum. When a citizen secures a loan for purchase of a home, the lending institution does not involve itself in the selection of furniture, carpets, draperies and so on. These decisions are the homeowners, as are the responsibilities for upkeep and repayment of the loan. Similarly, neither the State nor the loan recipient should be saddled with extensive oversight and review by the Federal government. Reasonable time periods for review should be established;

- \* Intended Use Plan Review -- One year after last capitalization grant.
- \* Annual Report -- One year after last draw of Federal money.
- \* Annual Review -- Two months after last annual report.
- \* Annual Audit -- Two years after last draw of Federal money.

Needs Survey: A credible survey of all municipal needs eligible for SRF financing should be undertaken periodically. States are concerned that the current survey does not include the 1987 Act mandates and thereby is not reflective of actual need.

Small Community Assistance: Importantly, more than 33% of identified SRF projects are for small communities. In some instances, however, low interest loans are unable to provide affordable assistance for communities with economic hardships. Small communities, with significant economic need, should be addressed with special assistance and consideration through the existing SRF. The States oppose the creation of a new Federally administered program to compete with the SRF. Provisions, for small communities should be incorporated into the SRF, with language defining small and/or hardship criteria and providing:

- \* Additional authorized funds to blend as a principal subsidy with SRF loans,
- \* Exemption from Title II and Federal cross-cutter requirements,

have and are implementing the SRF program. Overall, the program is working exceedingly well. Reforms, however, are needed to adequately capitalize the fund, streamline the program to expedite construction and maximize environmental results. It is also important for us to recognize and accommodate the needs of small communities.

**Funding:** SRF eligible requirements in the 1987 Act (e.g. nonpoint source, stormwater, combined sewer overflows, sludge, and toxics control) go far beyond the previously existing needs upon which the \$18 Billion 1987 capitalization was based. Municipal needs, in total, are likely to exceed \$200 Billion.

At a minimum, additional capitalization in the amount of \$5 Billion annually, until the year 2000, will be required to build the SRF to an acceptable level that can revolve in perpetuity. The inclusion of water supply facility assistance in the Title VI SRF will, as proposed by the President in his Economic Stimulus Package, require additional funding (see below). To fulfill the basic Clean Water Act requirements, Congress should appropriate at least \$2 Billion for traditional wastewater treatment needs in FY94.

**Grants:** ASIWPCA opposes re-establishing a Title II type grant program. The SRF has proven to be an efficient and effective use of scarce Federal dollars for meeting municipal infrastructure needs for several reasons. 1) All 50 States have their SRF's up and running, 2) Planning, design and implementation under SRF is 50% faster than under the Title II construction grants program, 3) Grants undermine the integrity of the SRF, 4) States have worked hard to work with communities to accept and participate in the SRF program, and 5) grants can delay compliance -- even a remote possibility of grants encourages communities to hold out for a grant rather than to proceed with a SRF toward construction. This sends a poor message to those trying to meet the requirements of the law -- reinforcing the appearance that if a community puts off solving their problems, the Federal government will come to the rescue with tax dollars.

#### Streamlined Requirements:

Through the administration of the State Revolves Loan Fund, States have identified several improvements which could enhance program operation. Specifically:

**Administration:** The 4% limitation on SRF administrative costs should be based on the appropriated amount, but no less than the authorization level, with a minimum of \$400,000 per State. The limitation should apply only to the Federal contribution, to allow States to utilize their own dollars to manage the program as they choose.

**Cross-cutting and Title II Requirements:** Some Federal requirements have no environmental value yet they increase project costs, cause delay, and decrease SRF competitiveness. For example, the Title II 20% limitation on the use of funds for nonpoint sources, major rehabilitation projects, combined sewer overflows, and collector sewers (Section 201(g)(1)) should not apply. While the Association accepts the Title II objectives, States should have the discretion to apply the goals as appropriate to individual projects. In the absence of obtaining this type of flexibility, the following modifications to Section 602(b)(6) are necessary:

- \* Up to 40 years for repayment of loans less than \$10 Million.
- \* Use of SRF funds for State small community outreach and technical assistance, and
- \* Land and easements as eligible costs.

States should set the population threshold for defining "small community", up to 10,000.

Expanded SRF Eligibility for Water Supply: The Association could support appropriation of additional supplemental funds for water supply projects and, short term use of the Title VI SRF as the vehicle for distribution with certain caueats. Furthermore, an "SRF type mechanism" should be considered as the best long term vehicle for fund distribution. However, such funding must not demean the integrity of the Clean Water Act SRF. Let me be very specific about the terms under which ASIWPCA can support an SRF for the drinking water program.

1. Additional funding must be authorized and appropriated above the \$5 Billion level recommended for Clean Water Act needs under the Title VI SRF program.
2. States must have the flexibility to establish separate SRFs, develop separate funding priorities and/or include water supply project funding under existing Title VI SRFs.
3. There must be separately identifiable Federal funding sources for both the Clean Water Act and Safe Drinking Water Act assistance programs.

In the long term, a Safe Drinking Water Act needs development process must be established.

### III. WATER QUALITY STANDARDS

The existing framework for developing standards is adequate for the existing program. However, USEPA needs to expand its 304(a) criteria process by developing meaningful implementation guidance to resolve outstanding issues and vagaries about translating criteria into permits. USEPA should not inhibit the States' ability to accommodate advancements in science. Significant differences in risk assessment within the scientific community and Federal programs also need to be addressed. States should continue reviewing standards on a triennial basis. Given diverse natural environments, standards need to be tailored to meet specific situations. States oppose presumptive application of Federal criteria as it significantly inhibits innovation and development of creative and aggressive new approaches.

States must continue their primary role in establishing standards and the burden of proof for disapproval should remain with USEPA.

1. USEPA should submit to Congress a five year schedule for accelerating revision and development of water quality criteria, with an annual update. The Agency should consult with the States in development and revision of the standards program. States should be provided the option to adopt numerical chemical and physical, and/or numerical narrative biological standards for toxics.
2. USEPA 304(a) criteria should be expanded to include implementation guidance.
3. Regulation of water quantity should continue to be the sole prerogative of the States.

#### IV. NONPOINT SOURCES

At the outset, it must be recognized that Section 319 of the Clean Water Act has been woefully underfunded. The necessary staff resources have not been provided at either the State or Federal levels, to assure the desired results. The Nonpoint Source Control Program (NPS) is inherently difficult because it affects individuals. It affects how we live and how we conduct our business. Because NPS control must take into account local conditions, States need to continue their lead role in program development and management. To produce results, States must have the ability to establish and maintain long term, consistent programs. This requires an effective national framework which requires:

- 1) USEPA to a) increase public awareness, b) develop better science, c) create regulatory/economic incentives, and d) issue guidance for evaluating State programs. Federal guidance should address specific source categories to cover, a) evaluation criteria, b) methods to estimate reductions in NPS loads, c) evidence of necessary local involvement, and d) critical habitat/ecosystem protection.
- 2) States too must enhance their programs to:
  - \* Identify priority watersheds, set goals, and establish implementation mechanisms with schedules and a monitoring program in 30 months.
  - \* Evaluate progress towards meeting water quality standards within 48 months after program approval. (After 1995, Federal funding should be contingent upon an approved plan.)
  - \* Update the program as needed to address water quality violations within 12 months after evaluation (and every 5 years thereafter).

To achieve objectives, a more efficient delivery systems are needed. The present process of project by project State work plan development, review and approval is not manageable at increased funding levels or ongoing programs. State use of 319 funds should be based on approved NPS implementation plans. And it is critically important that all related Federal agency activities and programs to be consistent with State plans. Program eligibilities are currently adequate, however, the type of activities covered as eligible, should include: planning, assessment, demonstrations, enforcement, technical assistance, education and training. Institution of local programs should be eligible and States should also be able to use up to 20% or \$200,000, (whichever is greater), to manage implementation and update 319 plans.

Funding: The Section 319 program should continue to cover nonpoint source control implementation costs not appropriately addressed through the SRF. The long term State goal is, however, to move the NPS program to a point where integration into Section 106 and SRF can occur. In the interim, annual funding annually under Section 319 should be authorized at:

- \* \$500 Million, FY 1994-96
- \* \$1 Billion, FY 1997-98

A specific formula should be used for distribution of funds to the States -- with elimination of national setaside for competitive projects ("beauty contests").

NPS control will be a long term undertaking comparable to point source control, but with a much higher level of intergovernmental cooperation. Progressively, the program should incorporate needed mandatory assurances, technology transfer, technical assistance and education programs. This will require controls at the watershed level that consider groundwater and surface water quality objectives.

## V. WATERSHED MANAGEMENT

Watershed management (incorporated as the River Basin Program, under Section 303) is a fundamental component of the 1972 Act. The initial program was designed to provide States with a vehicle to broadly examine pollution control priorities and strategies which are established via many independent processes and funding sources. The concept of Watershed Protection can be surgically enhanced by strengthening State Management Plans under Section 303(d), incorporating Section 304(l), 319, 320, and other programs coordinates. To incorporate the Watershed theme throughout the Clean Water Act it is important to:

1. Identify State geographic management areas under 303(d) to drive permit issuance, nonpoint source controls, monitoring, and other management decisions, including funding allocations.
2. Utilize State ranking within the Watershed for Federal monitoring programs.
3. Identify the geographic management areas under 303(d) to be reported to USEPA in the 305(b) and basin planning process. The Section 305(b) Report should be required once every five years, since water quality trends change slowly. Sufficient time is needed to develop improved and more consistent reporting.

Watershed protection is a "philosophy" of management that the States and ASIWPCA support. However, the Association does not support any approach that would:

- 1) Create a new program upon the many already existing.
- 2) Create a new layer of government or planning entities,
- 3) Impose a uniform or prescriptive "one size fits all" national approach,
- 4) Undermine State and Federal law or,
- 5) Encourage a weakening of water quality goals.

## TECHNOLOGY BASED LIMITATIONS

Categorical effluent limitations are a regulatory cornerstone of the Act and the *primary tool* for working efficiently and equitably toward eliminating and preventing pollution. Unfortunately, the majority of Best Available Technologies (BAT) guidelines are outdated and of little value. States are forced to rely on water quality standards to establish limitations, which is resource intensive. The Act should mandate that USEPA timely publish and revise Section 304(b) regulations to:

1. Set aggressive deadlines for updating existing effluent limitations for industries not yet addressed.
2. Better define best available technology (BAT) to assure that categorical effluent limitations do, in fact, reflect advancements in wastewater treatment.
3. Revise, as appropriate, the factors currently set forth in 304(b) for BAT to address pollution prevention and waste reduction.

## VI. POLLUTION PREVENTION

Agency-wide action is needed to assure progress efficiently and effectively toward pollution prevention and zero discharge of specific highly persistent, bioaccumulative substances. "End-of-pipe" solutions are only one mechanism. However, zero discharge does not necessarily mean zero availability, since persistent chemicals, once in the environment, are likely never to be zero. Therefore, the Act should assure that USEPA:

1. Prohibits under the Toxic Substances Control Act (TSCA) the production and use in the market place of specific persistent, bioaccumulative toxic substances. Priority should be placed on substances currently exceeding State/Federal action levels for fish flesh.
2. Lists toxics for which the discharge, emission, and release must be minimized in all media (air, water, waste management, etc.).
- 3) The pollution prevention strategy, emphasizing the technological solutions to minimize the discharge of persistent toxics.

## VII. STORMWATER

ASIWPCA supports the Act's stormwater control objectives, addressing the most significant sources first. However, the extensive time taken to finalize the USEPA rules makes the deadlines unachievable, threatening the Act's strategy of phased implementation. The Act needs to assure that stormwater requirements do not overwhelm or undermine State permit programs under NPDES, as the number of permits could increase 10 fold with the inclusion of stormwater. Unless action is taken to focus the program, major cuts in other programs -- including toxic controls -- must occur.

1. For municipal dischargers, controls that reduce discharges to the *maximum extent practicable* should be required and are consistent with the mandate that water quality standards be met.
2. For industrial dischargers, the first round permits should require implementation of *BMPs*.

Permits should not be required for, municipalities less than 100,000 population, unless a particular stormwater discharge is a significant contributor to pollution or the town is served by a separate stormwater system with a total population of 100,000 or more.

## IN SUMMARY

The States and the Association are appreciative of this Committees interest in moving expeditiously forward to reauthorize the Clean Water Act. Mr. Chairman, this subcommittee has consistently taken a strong leadership role in Clean Water and we look forward to having the opportunity to work closely with you and your excellent staff toward developing successful amendments to the Statute.

Water Pollution Control Administrators (ASIWPCA)

**CLEAN WATER ACT REAUTHORIZATION  
RECOMMENDATIONS**

The 1972 Clean Water Act set requirements for enhancing the nation's water quality using national goals, criteria and programs primarily implemented by the States. Tremendous strides have been made cleaning up and protecting the environment. In the process, States have gained considerable experience confronting serious water quality problems and developing effective approaches for addressing them. ASIWPCA recommendations on reauthorization are premised on the following principles:

- States need to continue their lead role in program development and management.
- The Act is fundamentally sound -- to enable States to accomplish the Clean Water Act goals:
  - \* More time is needed to carry out the ambitious 1987 Water Quality Act mandates.
  - \* Program and infrastructure needs must be funded more adequately.
  - \* Existing resources must be used more efficiently and effectively.
  - \* Increased Federal attention is needed to the program's basic building blocks, e.g., effluent guidelines and standards.
- Increased Federal monitoring coordination and Federal consistency with State plans is needed.
- Comprehensive planning, pollution prevention and nonpoint source control must be addressed.
- If Congress imposes additional mandates, it is critical that the Act assures:
  - \* State flexibility and
  - \* Funding above the 1987 Act baseline.

**STATE PARTNERSHIP (Section 101)**

Water pollution control programs are administered more efficiently and effectively at the State level. National policy development should be guided by the following principles:

1. ASIWPCA and State activities with USEPA should be recognized in the Act as consistent with the Federal Advisory Committee Act to assure adequate and meaningful input.
2. State programs should be approved if they meet the goals, objectives, and intent of the Act.

**Rationale:** Delegated programs should be designed to meet statutory objectives. They need not be identical to USEPA regulations, policies, or procedures. It is essential that State agencies be involved in USEPA policy development to maintain the partnership and interchange of ideas.

## STANDARDS, PLANNING AND MONITORING

### I. WATER QUALITY STANDARDS (WQS) (Section 303)

States should continue their primary role in establishing standards. The burden of proof for disapproval should remain with USEPA. USEPA also has a vital role in providing sound technical information. To respond to emerging water quality issues, the Clean Water Act should be amended to require that:

1. USEPA submit to Congress a five year schedule for accelerating revision and development of water quality criteria, updating it annually.
2. 304(a) criteria include implementation guidance on translating values into permit limits.
3. USEPA consult with the States in criteria development and revision.
4. In the absence of 304(a) criteria, USEPA may not disapprove State standards or NPDES permits implementing such criteria.
5. Air deposition violating standards is controlled and all USEPA programs comply with standards.

States should be allowed to adopt numerical *chemical and physical*, and/or *numerical or narrative* biological standards for toxics.

**Rationale:** While the existing framework for developing standards is adequate, USEPA needs to expand 304(a) criteria development. Each should include meaningful implementation guidance, since there are many outstanding issues and vagaries about translating criteria into permits, e.g. application of mixing zones and criteria in wet weather. USEPA should not inhibit State ability to accommodate advancements in science. Significant differences in risk assessment within the scientific community, USEPA programs, and other Federal agencies need attention.

The States should continue to review and revise WQS on a triennial basis. Given diverse natural environments, WQS need to be tailored to meet specific situations. Federal 304(a) criteria should not presumptively apply, because they prevent innovative and more aggressive approaches which improve upon the national program. State adoption is also more effective, since implementation is greatly expedited through the State promulgation/education process. States should be able to adopt either numerical or narrative criteria (if the latter is translated into numerical permit limitations) for each has distinct advantages). USEPA needs to continue to approve State WQS to assure interstate compatibility and compliance. However, regulation of water quantity should continue to be the sole prerogative of the States.

### II. MONITORING (Section 303)

The Act should identify a lead Federal agency to coordinate Federal monitoring programs in order to eliminate duplication and use resources much more efficiently requiring:

1. The lead Federal agency to identify a comprehensive program using States as the primary data collection and compilation mechanism, with Federal grant support to identify trends under 305(b).
2. USEPA to report to Congress on the status of the nation's waters and problem water bodies.

3. All Federally supported projects related to nonpoint sources should allocate adequate funding for water quality monitoring and assessment.

**Rationale:** States need to have ultimate responsibility to determine the scope of their monitoring programs. They should have a balanced program, with both problem detection and trend analysis. Federal monitoring activities are not well coordinated, causing gaps and duplication. As resources become severely constrained, efficient and effective use of their expenditures becomes critical. States should be more actively factored into Federal program development and data collection to reduce costs and strengthen Clean Water Act programs.

### III. GEOGRAPHIC TARGETING AND 305(b) REPORTS

**Targeting:** The Clean Water Act should strengthen and expand State Management Plans under Section 303(d) to incorporate Section 304(l), 319, 320, and other programs as appropriate.

1. The geographic management areas identified under 303(d) should drive permit issuance, nonpoint source controls, monitoring, and other management decisions, including funding allocations. USEPA should work with the States to develop guidance to facilitate the ranking process.
2. USEPA, USGS, and NOAA should be required to utilize State ranking to ensure that their monitoring programs cover priority watersheds.
3. The geographic management areas identified under 303(d) should be reported to USEPA in the 305(b) and basin planning process.

**305(b):** The Section 305(b) Report to Congress should be required once every five years and cover Section 314, Clean Lakes.

**Rationale:** Pollution control priorities and strategies are being established via many relatively independent ranking processes with over 15 funding sources which results in fragmentation and inconsistency. Geographic targeting should be encouraged.

Water quality trends change slowly. Rather than using limited resources to report water quality status every two years under 305(b), a more efficient and meaningful assessment should be conducted every five years. The current law has States and USEPA starting the next reporting cycle without sufficient time to develop improved and more consistent assessment and reporting methods.

## POINT SOURCES, COMPLIANCE AND ENFORCEMENT

### I. CONTROL STRATEGIES FOR TOXIC POLLUTANTS (Section 304(l))

ASIWPCA supports the control of toxicity from all sources impacting designated water uses. Future assessments should be conducted as part of the periodic 305(b) report. The 304(l) assessments were a one-time effort that should not be repeated. The control of toxic pollutants should become part of a comprehensive, integrated water pollution control program.

**Rationale:** Control of toxics must be an ongoing effort within a comprehensive program which considers all toxic pollutants and sources, utilizing the many existing authorities. Section 304(l) was a relatively narrow, one-time effort to control some toxics. Designated use impairments by other pollutants should not be relegated to a low priority.

## II. TECHNOLOGY BASED LIMITATIONS AND COMBINED SEWER LIMITS (Section 304)

The Act should mandate that USEPA timely publish and revise Section 304(b) regulations to:

1. Set aggressive deadlines for updating existing effluent limitations for industries not yet addressed.
2. Better define best available technology (BAT) to assure that categorical effluent limitations do, in fact, reflect advancements in wastewater treatment.
3. Revise as appropriate the factors currently set forth in 304(b) for BAT to address pollution prevention and waste reduction.
4. Establish guidance setting the minimum technology requirements for combined sewer overflows, considering site specific criteria and the need to avoid major retrofiting.

**Rationale:** Categorical effluent limitations are a regulatory cornerstone of the Act and the *primary tool* for working efficiently and equitably toward eliminating pollutant discharges. The majority of BAT guidelines are seriously outdated and of little value in the regulatory program. States are forced to rely on water quality standards to establish proper effluent limitations -- which is resource intensive. Strong updated guidelines will avoid the inefficiencies of ad hoc best professional judgements as well as the inconsistencies and negative incentives associated with that approach. They are the most effective means to accomplish pollution prevention, waste minimization, and recycling.

Federal guidance on technology based requirements for combined sewer overflows is needed to assure the Act's mandates are met. However, they need to be flexible and avoid costly retrofiting of facilities now providing adequate treatment.

## III. POLLUTION PREVENTION AND ZERO DISCHARGE (Section 101)

The USEPA should take *agency-wide* action to assure maximum progress toward pollution prevention and zero discharge of specific highly persistent, bioaccumulative substances. The Act should assure USEPA:

1. Prohibits under the Toxic Substances Control Act (TSCA) the production and use in the market place of specific persistent, bioaccumulative toxic substances. Priority should be placed on substances currently exceeding State/Federal action levels for fish flesh.
2. Lists toxics for which the discharge, emission, and release must be minimized in all media (air, water, waste management, etc.). The mandate should go beyond traditional technology or water quality based limitations to enable States to establish innovative regulatory programs.

**Rationale:** States and USEPA need to more efficiently and effectively protect the environment, since "end-of-pipe" solutions are only one mechanism. Chemical bans should be part of source elimination and a pollution prevention strategy. But, zero discharge necessarily means zero availability -- persistent chemicals, once in the environment, are likely never to be zero. The pollution prevention strategy, while rejecting certain notions of zero discharge, should emphasize the need for technological solutions to minimize the discharge of persistent toxics already in the environment.

## IV. ANTIBACKSLIDING (Section 402(o))

The Act should allow the removal or modification of permit effluent limits determined to be unnecessary because of errors in calculation, publication of new scientifically valid information, or determination that

a substance is not present after an appropriate monitoring period. The removal of a limit should not allow permittees to reduce the level of existing treatment technology.

**Rationale:** Application of antibacksliding requirements in the NPDES program needs to be clarified. Permits are being significantly delayed due to unnecessary conflicts between regulators and permittees who are reluctant to accept limits which will be impossible to change even though such action is justified. The policy has made it difficult for States to adopt and implement new water quality standards, discouraged facilities from performing better than permit limits require, and allocated scarce resources to unnecessary monitoring and compliance.

#### V. STORMWATER (Section 402(p))

The statutory deadlines for permit issuance should be revised to establish a realistic schedule that accommodates phased implementation of regulatory programs:

1. For municipal dischargers, controls that reduce discharges to the *maximum extent practicable* should be required and are consistent with the mandate that water quality standards be met.
2. For industrial dischargers, the first round permits should require implementation of *BMPs*.

Permits should not be required for municipalities less than 100,000 population, unless a particular stormwater discharge is a significant contributor to pollution or the town is served by a separate stormwater system with a total population of 100,000 or more. Nor should they be required for industrial indirect discharges to a permitted municipal separate storm sewer, unless the discharge is in violation of local requirements and an individual stormwater permit is needed.

Following implementation of these controls, water quality assessments should be conducted to determine if additional controls are required in subsequent permits to meet water quality standards.

**Rationale:** ASIWPCA supports the Act's stormwater control objectives. The most significant sources should be addressed first. However, the extensive time taken to finalize the USEPA rules makes the statutory deadlines unachievable. The Act's strategy of phased implementation is threatened, since the moratorium from permitting second priority sources is fixed by statute, while the deadline for first priority sources (industry, large and medium municipalities) has been extended. The Act should clarify that the first round of permitting should emphasize specific control levels, followed by water quality assessment to identify needed additional actions based on standards. This will assure that permitting proceeds in a logical and expeditious manner.

Stormwater requirements should not overwhelm and undermine State permit programs. This is important since the number of NPDES sources will increase over ten times above current levels. The resource demand far exceeds any likelihood of increased funding and expected water quality benefits. Unless action is taken to focus the program, major cuts in other programs -- including toxics controls - must occur to carry out the stormwater requirements.

#### VI. PRETREATMENT (Section 307)

The Clean Water Act should require USEPA to establish aggressive deadlines for updating the existing categorical standards for pretreatment industrial categories reflecting best available technology economically achievable (BATEA), as well as including pollution prevention and waste reduction measures. POTWs should not be required to develop local limits analogous to effluent guidelines (EGL) for industries not covered by EGL. The domestic sewage exclusion should not be eliminated.

**Rationale:** EGLs are critical to POTWs' ability to meet water quality based effluent limits and need to be developed by USEPA. POTWs do not have the expertise to develop analogous limits so that all indirect dischargers to municipal systems are covered, nor is that necessary. The domestic sewage exclusion should not be eliminated because the current system of statutory requirements works. Elimination would create major problems for local POTW pretreatment administration and lead to a rigid bureaucratic system that would not deal with mixed wastes any more effectively than the current system. The exclusion gives States and POTWs needed flexibility to make appropriate decisions.

#### VII. TEN YEAR PERMITS (Section 402(b))

Up to a ten year NPDES permit term is desirable for some sources, considering that those permits will be re-opened for good cause, e.g. revision of effluent guidelines, changes to the water quality standards, or identification of water quality problems.

**Rationale:** Many permits need no changes from one 5-year cycle to the next. Yet, scarce and valuable resources -- which could be devoted to far more important permit issues -- must be used to prepare applications and go through the full permitting process. General permits are only a partial solution, because some permits must have water quality based limits. Tying reissuance to changes in technology or standards is more efficient and protective of the environment.

#### VIII. STATE ENFORCEMENT AUTHORITY (Section 309)

Clean Water Act reauthorization should provide delegated States the authority to file suit under Section 309, using NPDES permit authorities in Federal court. States should not be required to have monetary civil penalties identical to USEPA's. The ultimate goal is compliance and States have a variety of mechanisms in addition to penalties to accomplish that.

**Rationale:** The Act should give States greater enforcement capability. The best enforcement action is the one (alone or in combination) that produces and maintains compliance most efficiently and effectively. Tools in the States' enforcement arsenal are more expansive than USEPA's -- including moratoriums, closures, prohibitions, bans on expansions, etc. -- can be even more effective in achieving compliance than civil penalties.

#### IX. VESSEL DISCHARGES (Section 312)

The Clean Water remove prohibition against States regulating discharges from vessels should be removed.

**Rationale:** All other sections of the Clean Water Act not only allow, but require States to be more restrictive than Federal requirements if needed to protect water quality. Section 312(f)(1)(A) prohibits the option. The objective of fishable, swimmable waters is, therefore, precluded. Studies have shown that bacteria counts from vessels are high and the vessel population in some States is increasing 10% per year. The law also works against use of the Federal Sport Fish Restoration Fund for State pumpout facilities.

## NONPOINT SOURCES

### I. RESEARCH (Section 105)

The Act should be amended to clarify that nonpoint source (NPS) research and development needs more attention related to NPS best management practices, removal of toxic pollutants, simpler treatment alternatives for smaller communities, cause-effect impacts, improved monitoring, analytical and modeling techniques, health and aquatic effects, and relationships between air, water, and land pollution. The necessary funding should be authorized and appropriated.

**Rationale:** State and local programs need more Federal research on development of control technologies, establishment of standards or criteria, and better analytical tools.

### II. NATIONAL PROGRAM ELEMENTS (Section 319)

A stronger framework should be established to implement NPS programs requiring:

- 1) Adequate Federal funding for NPS control and State management.
- 2) USEPA to increase public awareness, develop good science and regulatory/economic incentives, and issue guidance for evaluating State programs. The guidance should address source categories to cover, evaluation criteria, methods to estimate reductions in NPS loads, evidence of necessary local government authority/involvement, and critical habitat/ecosystem protection.
- 3) States to:
  - \* Identify priority watersheds, set goals, and establish implementation mechanisms with schedules and a monitoring program in 30 months.
  - \* Evaluate progress towards meeting water quality standards within 48 months after program approval. (After 1995, Federal funding should be contingent upon an approved plan.)
  - \* Update the program as needed to address water quality violations within 12 months after evaluation (and every 5 years thereafter).
- 4) Federal agency activities and programs to be consistent with State plans.

To achieve these objectives, more funds and more efficient delivery systems are needed. A 6-8 year period will be required to upgrade the effort and evaluate success. The present process of State work plan development and review under which USEPA reviews all projects in State work plans is not manageable at increased funding levels. State use of 319 funds should be solely based on a USEPA approved NPS implementation plan (NIP). Grants or loans distributed by States should be structured to require appropriate local commitment.

The range of problems eligible should not change. However, the type of activities covered by grants for implementation should include, but not be limited to, the following: planning, assessment, demonstrations, enforcement, technical assistance, education and training. Institution of local programs should be eligible. States should be able to use up to 20% or \$200,000, whichever is greater, to manage implementation, including developing the NIP and updating 319 plans. The setaside for USEPA administration should not exceed 5% of funds appropriated. [See Funding for authorization levels, match requirements and formula.]

**Rationale:** The majority of existing water quality problems stem from NPS pollution. This requires careful attention to land use management. Because NPS control must take into account local conditions, States need to continue their lead role in program development and management. However, changes in the Act are needed to achieve environmental results and mandates must be accompanied by State flexibility, new long term funding, and Federal consistency requirements.

NPS control will be a long term undertaking comparable to point source control, but with a much higher level of intergovernmental cooperation. Section 319 management plans provide the framework of priorities a myriad of agencies at all levels of government need to implement. Progressively, the program should incorporate needed mandatory assurances, technology transfer, technical assistance and education programs. Efforts must be broadened to address the importance of physical habitat, including restoration and conservation of buffer zones adjacent to streams and wetlands. Pollution prevention and source reduction are also essential and nutrient management plans are appropriate, especially for agriculture. Reduction of NPS pollution will require source control at the watershed level. The major local responsibilities need to be recognized. Groundwater and surface water quality protection objectives should be integrated in the NPS program.

## STATE REVOLVING LOAN FUND

### **I. GRANT PAYMENTS - Administrative Costs and Planning Setasides (Section 601(b))**

**Payments:** Payment of Federal capitalization grants must be in cash.

**Administration:** The 4% limitation on SRF administrative costs in Section 603(d)(7) should be based upon the appropriated amount, but no less than authorization level, with a minimum of \$400,000 in Federal assistance per State. It should apply only to the Federal contribution, i.e. not to loan repayments or other money deposited in the Fund.

**Setaside:** The Act should clarify that the 40% pass for local agencies in Title II (Section 205(j)) does not apply to State planning under Section 604(b).

**Rationale:** The 1987 Act envisioned cash payments to the State Revolving Loan Fund (SRF), stating that "all funds... will be expended in an expeditious and timely manner". Cash needs to be fully available to effectively promote creative financing, allow modest interest earnings to help the already undercapitalized SRF, and minimize operating costs. But, USEPA and the Office of Management and Budget developed the Letter of Credit to delay cash draw.

4% of the capitalization grant is the only money in the SRF that can be used for program management. After FY 1994, this amount will be "zero". Congress intended that the Fund be self-sustaining and, therefore, should allow States to fund the reasonable costs of administration. A minimum is needed for States with very small allotments. States should not be required by USEPA to pass through 40% of 604(b) funds, since the Act does not specifically state this. Federal funds for States are diminishing and flexibility is needed to allocate funds to priority problems.

### **II. CROSS-CUTTING AND TITLE II REQUIREMENTS (Section 602)**

Federal requirements *not specified in Title VI* should not be imposed on local communities. The Title II 20% limitation on the use of funds for nonpoint sources, major rehabilitation projects, combined sewer overflows, and collector sewers (Section 201(g)(1)) should not apply to the SRF. In addition, while the Association recognizes the value of some Title II objectives, States should have the discretion to apply

these goals as appropriate to individual projects. In the absence of obtaining this type of flexibility, the following modifications to Section 602(b)(6) are necessary:

1. Delete Section:
  - \* 201(g)(1) on the 20% Limitation
  - \* 201(g)(5) on Innovative/Alternative Analysis
  - \* 201 (6)(g) on Recreation/Open Space Requirements
  - \* 513 on Labor Standards Provisions
2. Delete the word "proportional" in Section 204(b)(1), User Charge Requirements
3. Delete mandatory requirement to perform value engineering in Section 218, Cost Effectiveness

**Rationale:** Every Title II regulation, Federal law and Executive Order should not apply to "funds directly made available by capitalization grants", due to increased project costs, cleanup delays, and decreased SRF competitiveness. The SRF was created to fund projects broadly eligible under Sections 212, 319 and 320 of the Act. Application of the 20% cap from the defunct grant program to the SRF prevents financing facilities which are important to protecting water quality (Section 602(b)(6)).

### III. LAND ELIGIBILITY (Section 603(c))

Acquisition of land, easements and rights of way should be an eligible SRF cost.

**Rationale:** The current exclusion is a holdover from the defunct construction grants program. Land, easements and rights of way can be a substantial portion of facility costs. For communities, the SRF needs to provide "one stop shopping".

### IV. LOAN AMORTIZATION PERIOD (Section 603(d)(1)(B))

The 20-year loan repayment period should be extended to 30 years generally and up to 40 years in financial hardship situations to make the SRF more competitive with other financing sources and reduce the need to erode the Fund corpus with deep discount interest rates.

**Rationale:** Local officials pay close attention to annual costs during the early years of loan repayment, i.e. during their expected term of office. Unless States can substantially reduce SRF interest rates, they cannot compete with a 30-year market rate. And, in smaller communities, affordable rates are difficult even with 0% interest (see Small Communities).

### V. FEDERAL OVERSIGHT/REVIEW AND THE SINGLE AUDIT ACT

**Oversight:** USEPA and Inspector General oversight should end within a reasonable period after the last deposit of Federal money in the SRF. The following schedule is recommended in Section 606:

- \* Intended Use Plan Review -- One year after last capitalization grant.
- \* Annual Report -- One year after last draw of Federal money.
- \* Annual Review -- Two months after last annual report.
- \* Annual Audit -- Two years after last draw of Federal money.

**Audits:** States should be able to use the Single Audit Act to satisfy requirements of Section 606(b).

**Rationale:** The law currently contains *no provision* to end Federal oversight and review of the State programs after the capitalization period. Congress intended that the SRF be a State program. The 1987 Act requires annual audits as necessary or appropriate. States should be able to use the Single Audit Act, which is *the method* for auditing Federal funds.

#### VI. USE OF GRANT FUNDS AND TITLE II CLOSEOUT

Title II deobligations and reallocations should be available for SRF use. The already limited SRF administration funds should not be used to close-out the Title II Construction Grants program (Section 607(b) and 603(d)(7)).

**Rationale:** States should be able to use deobligated and reallocated Title II funds in their SRFs, regardless of the year of origination. SRF administration funds are inadequate for long term fund management. And, it is inappropriate for the SRF or its client municipalities to assume the costs of closing out the Federal grant program.

#### VII. NEEDS SURVEY (Section 516)

A credible survey of all municipal needs eligible for SRF financing should be undertaken periodically.

**Rationale:** The current Needs Survey does not focus on the increased eligibilities under the 1987 Act mandates, such as toxics, sludge, nonpoint source and stormwater control. Given their potential magnitude, it is necessary to provide credible data for national policy and sound capital planning.

#### VIII. Expanded Eligibility For Water Supply Facilities (Section 603)

The Association could support appropriation of supplemental funds for water supply projects and, for the short term use of the Title VI SRF as the vehicle for distribution of these funds. Furthermore, an "SRF type mechanism" should be considered as the best long term vehicle for funds distribution. However, such funding must be in addition to existing Clean Water Act appropriations, and not demean the integrity of the Clean Water Act SRF. Specifically in the short and long term:

1. Additional funding must be authorized and appropriated above the \$5 Billion level recommended for Clean Water Act needs under the Title VI SRF program.
2. States must have the flexibility to establish separate SRFs, develop separate funding priorities or include water supply project funding under existing Title VI SRFs.
3. There must be separately identifiable Federal funding sources for both the Clean Water Act and Safe Drinking Water Act assistance programs.

In the long term, a Safe Drinking Water needs development process must be established to provide Congress and others with information on funding levels to support the program with expanded eligibilities.

#### SMALL COMMUNITY ASSISTANCE

Small communities in high economic need require special assistance *through the SRF* and should be exempt from some requirements. A new competing Federally administered program should not be created. Amendments should be enacted defining State hardship criteria and providing:

- \* Additional authorized funds to blend as a principal subsidy with SRF loans,
- \* Exemption from Title II and Federal cross-cutter requirements,
- \* Up to 40 years for repayment of loans less than \$10 Million,
- \* Use of SRF funds for State small community outreach and technical assistance, and
- \* Land and easements as eligible costs.

States should be able to set the population threshold for defining "small community", up to 10,000.

***Rationale:*** Over 33% of identified SRF projects are for small communities. But, in some cases low interest loans will not, alone, provide affordable assistance due to economic hardship. Additional assistance is best provided by an existing State administered program. Collectively, the recommendations above will enable the SRF to accommodate these communities. The definition of "hardship" should account for State diversity, e.g. a standard based on the national (vs. State) median household income will not suffice.

## WETLANDS

States and localities need an explicit and well thought out partnership role in the Clean Water Act to ease assumption of greater responsibility and more active participation in wetland protection and management. Many of the changes needed in the present Section 404 Federal role could be achieved administratively under existing law. However, a separate new section of the Act is needed to clearly establish State and Local roles as well as define protection policies and goals. State and Local governments need to integrate wetland protection into pollution control and watershed management. The Association endorses the concepts adopted by the National Governors' Association in February 1992 and will further refine the concepts to more specifically address a lead Federal agency, funding, and State assumption.

1. National wetlands protection policy should vigorously abate the loss of wetlands and achieve no net loss by preventing avoidable or significant impacts, and restoring when feasible quantity and quality. If impacts are unavoidable, wetland losses should be minimized and fully mitigated. Due to the severity or significance of some projects, mitigation may be inappropriate, and applications should be denied.
2. Federal statutes/programs should be amended to strengthen wetland protection and avoid duplication. Lead responsibility should be placed in one Federal agency, with other agencies having implementation duties. Federal permitting should be streamlined under one agency -- mandated to protect wetlands. Acquisition programs should be expanded and improved. The Federal government should provide guidance, research, public education and other information. States should have primary responsibility to implement effective protection strategies, with broad flexibility based on legal, environmental, social and economic considerations. They should develop comprehensive inventories, expand public education, and train local officials. Federal wetlands legislation should:
  - \* Address inconsistencies and shortcomings of protection programs, e.g. in USEPA, Army Corps of Engineers, Department of the Interior, and Department of Agriculture.
  - \* Promote delegation and provide adequate financial/technical support to the States.
  - \* Ensure Federal funds are not provided for activities which result in avoidable wetlands conversion.
3. In the event that water quality standards for wetlands are developed and incorporated into State water quality management programs: these standards should be designed to recognize unique features

intrinsic in wetland resources, USEPA should allow use of narrative and site specific approaches in lieu of numeric standards, and levels of protection should be based upon the importance and significance of wetlands to States in which they are located.

**Rationale:** Wetlands are an extraordinarily valuable resource, critical to the hydrologic system. Despite relative scarcity, they continue to be destroyed at an alarming rate and protection programs continue to struggle. Federal programs, while slowing the rate of loss, have fallen short of providing needed protection, even though feasible alternatives exist. They need to be reinforced and enhanced,

## GROUNDWATER

Groundwater protection should be an integral part of State and Federal water quality protection programs. Components may include regulatory authorities for point and nonpoint sources, monitoring, data management, standards and remediation programs. Programs should be based on protection of groundwater as a resource. A national goal established to protect human health and the environment by preventing groundwater pollution and remediating wherever necessary and appropriate.

1. Existing authorities should be coordinated to ensure that groundwater is not degraded or harmful to human health and the environment. Because groundwater is highly variable, States must maintain the primary responsibility for management, in partnership with the Federal government.
2. All Federal agencies, facilities, and contractors must comply with State groundwater laws.
3. Water quality protection programs must address both surface and groundwater media.

Any inclusion of groundwater in the Act should formalize the following processes:

- \* States and USEPA should jointly define State program adequacy.
- \* States should develop groundwater strategies consistent with that definition. Determination of adequacy of a comprehensive program should be the State's responsibility.
- \* USEPA should provide funding to States for program development and implementation.
- \* The Federal government should review their remediation programs and increase funds for comprehensive groundwater pollution prevention where appropriate.

At a minimum, the Federal government should provide incentives for States to develop comprehensive programs by:

- \* Providing more State flexibility in implementing Federal regulatory programs.
- \* Allowing greater flexibility in the use of all USEPA groundwater related grant money.
- \* Developing a comprehensive strategy for all Federal groundwater programs.
- \* Reducing USEPA oversight.
- \* Requiring Federal facilities, contractors, programs etc. to comply with all State requirements.
- \* Requiring Federal agencies to utilize State groundwater priorities in targeting programs/projects.

CERCLA Trust Account funds should be available for State groundwater protection activities upon USEPA endorsement of a State's core Comprehensive State Ground Water Protection Program.

**Rationale:** Incorporation of groundwater into Clean Water Act goals will eliminate the need for prescriptive groundwater legislation. Enforcement of State laws is currently hampered because Federal agencies sometimes claim sovereign immunity, because groundwater is not included in the Act.

Federal groundwater requirements should not be prescriptive. The above steps will eliminate the need for extensive national groundwater legislation or amendments to existing environmental laws and will promote multi-media resource management. A formal mechanism is needed to coordinate the many Federal groundwater initiatives.

## FUNDING

### **I. STATE MANAGEMENT ASSISTANCE (Section 106)**

States are implementing the mandates of the Act to the maximum extent possible. However, with increased requirements of the 1987 Amendments (stormwater, toxics, nonpoint source, etc.), there is a serious funding shortfall which must be addressed through increases in 106 funding, establishment of an equitable fee system, and continuation of State revenues.

**106 and Permit Fees:** The Section 106 authorized level should be increased and discretionary USEPA setasides should be eliminated. Grant policy and awards should be expeditiously processed consistent with State planning/work cycles. Federal match requirements should be phased in over 3 years and any level of effort (LOE) requirements should be based on the current level of State general appropriations in terms of dollars. The LOE should be maintained unless there is an across-the-board State budget reduction.

The Act should provide a Federal permit fee structure with exemptions for State programs with equivalent total receipts. USEPA should impose fees only if States fail to do so. Fees assessed by States should be retained for broad use in their water programs. States should be able to use those fees to meet their 106 matching requirements.

**Consolidation:** To support comprehensive programs, the Act should fold the proliferation of entitlement grants, setasides, and earmarks into Section 106. Accommodation should be made for differences in regional/State priorities (see Targeting) to achieve environmental results. Congressional priorities should be incorporated into negotiated State work plans vs. using setasides.

**Rationale:** While States support the statutory mandates, inadequate funding of new and existing requirements is adversely affecting their capabilities. For FY92:

* Cost of Operating Basic Activities	\$475 Million
* Additional Costs of Implementing 1987 Amendments	230
<hr/>	
TOTAL CLEAN WATER ACT PROGRAM COST	705
Estimated Funds Available [Federal, State, other]	300

#### Shortfall

**\$405 Million**

*These are conservative estimates. Any further requirements or desire to "cost out" USEPA regulations (e.g. stormwater) would significantly add to the total.*

The Act, in many sections, establishes authority for appropriations. Section 106, however, has historically been the framework to carry out mandates and has the proven capability to direct resources efficiently to priorities. State funding is now provided through over 15 grant programs, e.g. Section 104(b)(3), setasides in Section 106 and Title VI, etc. Each has a different bureaucracy, match requirements, policy documents, eligibility criteria, and application/reporting requirements. The end result is extensive delays in grants and program activities, and inconsistent support for Clean Water priorities. Balkanization does not promote preventing pollution, reducing risks, achieving environmental results, or minimizing adverse inter-media impacts.

## II. SRF CAPITALIZATION AND CONTINUATION OF TITLE II GRANTS (Section 607)

**SRF:** Current SRF eligible needs resulting from the 1987 Act (including nonpoint source, stormwater, combined sewer overflows, sludge, and toxics control) go far beyond the previously existing wastewater infrastructure program upon which the \$18 Billion commitment in the 1987 Act was based. They are likely to exceed \$200 Billion. Federal appropriations fall short of the capitalization level needed.

**FY 1993-1994:** To fulfill the basic 1972 Clean Water Act requirements Congress should appropriate at least \$2 Billion annually for the SRF program for traditional wastewater treatment needs.

**FY 1994-2000:** A minimum of \$3 Billion should be appropriated annually through the year 2000 for the new compliance needs added in the 1987 Act.

Therefore, a total appropriation of \$5 Billion annually, until the year 2000, is needed to meet current Clean Water Act eligibilities. The inclusion of water supply facilities assistance in the Title VI SRF would require additional funding (see page 10).

**Grants:** ASIWPCA opposes re-establishing a Title II type grant program. The \$18 Billion authorized for SRF capitalization must first be fully realized and the SRF capitalized sufficiently to cover the additional infrastructure requirements created by the 1987 Clean Water Act. If Congress is intent on grants, they should go to State SRFs for agreed upon purposes, e.g. to revolve as long as needed for CSO needs.

**Rationale:** The SRF was conceived to meet infrastructure needs under the pre-existing law. \$18 Billion in Federal capitalization funds (FY86-94) and the State match may provide adequate seed money to address those needs, but it is grossly inadequate to meet the 1987 Act mandates. Of the \$138 Billion in documented needs that States have identified, up to \$91 Billion relate to emerging priorities. The SRF has proven to be an efficient and effective use of scarce Federal dollars in meeting municipal infrastructure needs *in perpetuity*. It should not be abandoned for a grant approach that the 1981 and 1987 Amendments concluded, for good reason, was inadequate.

1. A Federal grant program is a poor mechanism to meet the over \$135 Billion in needs.
2. Grants undermine the integrity of the SRF. States have worked hard to educate and convince communities to accept and participate in the SRF program.
3. Compliance will be delayed. Even a remote possibility of grants encourages towns to wait. It sends a poor message to those trying to meet the law -- reinforcing the appearance that if a community puts off solving their problems, the Federal government will come to the rescue.
4. Fiscal hardship situations can be addressed *in the SRF* (see Small Communities).

## III. NONPOINT SOURCE MANAGEMENT PROGRAMS (Section 319)

Current SRF eligibilities should be retained to allow for coverage of NPS projects. The Section 319 program should continue to cover NPS program implementation costs not reasonably addressed through the SRF. The long term State goal is to move the NPS program to a point where it can be integrated into Section 106 and SRF structures. In the interim, annually the following should be authorized under Section 319:

FY 1994-96, \$500 Million

FY 1997-98, \$1 Billion

- \* A set distribution formula should be used for the States -- with no national setaside for "beauty contests" (i.e. competitive projects at the USEPA level).

- \* The existing 40% match should be retained.

[See Nonpoint Sources regarding the use of those funds]

**Rationale:** The nonpoint source management plans, demonstration projects, and program development envisioned in the 1987 Act have not been completed. Appropriations have been well short of authorizations, and must be increased if the accomplishments so far are to be maintained and expanded, consistent with water quality objectives. However, demonstration projects will not accomplish the needed water quality improvements. If the program is going to produce the needed results, States must have the ability to establish and maintain long term, consistent programs.

#### IV. CLEAN LAKES (Section 314)

A level of support in the amount of \$10 Million annually will assure the minimum level necessary for progress in lakes management.

**Rationale:** Section 314 of the Act should be funded at a level which recognizes the key role the Clean Lakes Program plays in achieving beneficial uses. Appropriations should be sufficient to support continued assessment, identification and implementation of methods to restore lake quality.

March 29, 1993

The Honorable Bill Clinton  
President of the United States  
The White House  
1600 Pennsylvania Avenue  
Washington, DC 20500

Dear Mr. President:

The ASIWPCA appreciates your attention to the States' critical need for water infrastructure financing. The States strongly support your proposal to provide \$845 million to the Clean Water Act state revolving loan funds (SRFs) as an economic stimulus in fiscal year 1993; 1) to extend funding for SRFs through fiscal year 1997; and 2) to finance a new revolving fund for drinking water. To assure the long term health and continued effectiveness of the Clean Water Program the States urge you to consider the following revisions to your proposal.

- 1) A minimum fiscal year 1994 appropriation of a full \$2 billion to the Clean Water Act SRFs.
- 2) A full \$1 billion for the drinking water revolving fund. The \$845 million in proposed stimulus spending should be in addition to a \$2 billion fiscal year 1994 SRF appropriation. Stimulus spending should represent a real increase in funding, not merely accelerated spending of fiscal year 1994 funds in fiscal year 1993.

A \$3 billion annual funding level for wastewater and drinking water treatment is clearly justified by documented needs in both programs. ASIWPCA, for example, has identified in excess of \$10 billion in immediate project needs. To ensure sufficient appropriations in fiscal years 1995-97 it is important to establish a \$3 billion baseline in fiscal year 1994.

In addition, States call on you to assure that all wastewater infrastructure is funded through the Clean Water Act SRFs. SRFs provide sustainable long-term funding, have low administrative costs and a 50 percent faster payout rate than categorical grants, and provide incentives to local government to reduce costs and develop appropriate user fee systems.

ASIWPCA appreciates your consideration of our recommendations and we look forward to having the opportunity to work with you and members of your staff to implement the Clean Water Components of the Stimulus package. Please feel free to contact our Executive Director, Roberta (Robbi) Savage if additional information is desired, 202-898-0917.

Sincerely,

Don Ostler  
President  
Association of State and Interstate  
Water Pollution Control Administrators

RECOMMENDATIONS OF THE  
COASTAL STATES ORGANIZATION, INC.

ON THE  
REAUTHORIZATION OF THE CLEAN WATER ACT

Before The  
Water Resources Subcommittee  
House Public Works & Transportation Committee

David C. Slade  
Director

March 31, 1993

---

Mr. Chairman, and members of the Subcommittees, my name is David C. Slade. I am the Executive Director of the Coastal States Organization, a representative association of the Governors of the 35 coastal States, Commonwealths and Territories on coastal, Great Lakes and ocean affairs. I am pleased to be here today to present our views on the Reauthorization of the Clean Water Act.

The Coastal States Organization has deliberated for many months on the reauthorization of the Clean Water Act. Forging an agreement among the divergent views on the many issues involved posed a formidable challenge to the organization. Among the coastal States there are several issues where there simply was no consensus on the proposed changes to the Clean Water Act. Nevertheless, after many long sessions there are several areas upon which the States are now able to agree. These areas pertain to:

- Contaminated Sediments;
- Combined Sewer Overflows;
- The National Estuary Program;
- Nonpoint Source Pollution Control; and
- Wetlands.

The following discussion presents our detailed proposals for amending the Clean Water Act.

## CONTAMINATED SEDIMENTS

The COASTAL STATES ORGANIZATION recommends that the Clean Water Act should be amended to:

- Clarify that State water quality standards which are more stringent than federal requirements are controlling for all activities involving the dredging or disposal of sediments;
- Clarify that States have the authority to establish clean-up standards for contaminated sediments so long as those standards are as at least as stringent as federal requirements;
- Ensure a State role in the development of management or restoration plans for contaminated sediments;
- Develop programs and provide assistance to the States through those programs for preventing sediment contamination;
- Encourage through federal financial and technical assistance the development and utilization of innovative technologies for contaminated sediment remediation.

### RATIONALE:

Throughout the nation, coastal States are engaged in disputes with the Army Corps of Engineers over the protection of the aquatic environment from the harmful effects of the dredging of contaminated sediments. These disputes center around the Army Corps' Dredging Operating & Maintenance regulations.

In 1988, the Corps promulgated regulations which State that for operational dredging and maintenance activities, the Corps will set a "Federal standard" based on the "cost, beneficial uses of dredged material and the environment." The environmental requirements which the Corps will consider are only those which are federal environmental requirements, even though the Clean Water Act incorporates State requirements as federal law. The Corps also maintains that if the State "insists on requirements which, in the opinion of the district engineer, exceed those required in establishment of the Federal standard, the [State] agency will be asked to fund the difference in cost."

Under the Clean Water Act, States have the primary authority to protect water quality. Federal agency activities should be required to comply with State water quality standards. We ask that Congress make it indisputably clear that the Corps must comply with State water quality standards and section 401 State certification procedures, not as a matter of "comity" but as a matter of law.

COMBINED SEWER OVERFLOWS

The COASTAL STATES ORGANIZATION recommends that:

- Correction requirements for combined sewer overflows should be based on the water quality impact, an assessment of the resource and habitat benefits, the feasibility of elimination, abatement alternatives, a comparison of elimination and alternatives costs, the financial resources of the responsible governmental entity, and availability of federal financial assistance;
- Federal assistance for combined sewer overflows abatement should include assistance for a full range of alternatives including, but not limited to, pretreatment, best management practices, and stormwater and watershed management;
- EPA should be required to establish a clearinghouse to make available information on and provide technical assistance for controlling combined sewer overflows;
- Technology-based standards relating to the control of specific storm events should not be mandated through the Clean Water Act.

RATIONALE:

The severity of combined sewer overflow water quality problems varies according to the composition of the overflow and the characteristics of the receiving waters. A combined sewer overflow abatement program should be tailored to the circumstances unique to each sewage-stormwater system. Remedial projects should be undertaken in priority order focusing first on those systems causing the most environmental damage.

Mandates to control combined sewer overflows should not be arbitrarily imposed without regard to receiving water use impairments or violations of water quality standards. The better and far less expensive strategy is to implement only those combined sewer overflow abatement measures which will result in attainment of water quality standards. The precise mix of combined sewer overflow control measures will vary depending upon local conditions.

The magnitude of the problem along with the fiscal crisis many local and State governments already face has created an essential need for greater federal financial assistance to abate combined sewer overflows.

## NATIONAL ESTUARY PROGRAM

The COASTAL STATES ORGANIZATION recommends the following changes to Section 320 of the Clean Water Act:

- NOAA and State CZM agencies should be specifically included as participants in management conferences;
- In considering nominations for the designation of estuaries of national significance, priority consideration should be given to those estuaries represented in the National Estuarine Research Reserve System;
- Relevant enforceable polices of CCMPs, as determined by a State's coastal management agency, should be incorporated into federally approved State coastal management plans;
- When necessary, extensions of management conferences should be allowed (up to five years) for plan development, and additional extensions allowed for plan implementation;
- There should be a continuing federal responsibility for plan implementation;
- CCMPs should include specific estimates on funding needs and a comprehensive strategy for least cost implementation;
- EPA and NOAA should be directed to submit to Congress on an annual basis a report containing cost estimates for implementing approved estuary management plans and recommended allocations of Estuary funds. Those recommendations should be based on each State's need, as identified in EPA's report, relative to all estuaries in the program.
- A separate funding authorization should be provided for assessment and characterization activities required under subsection (j) conducted by NOAA;
- Separate authorizations should be provided to EPA and NOAA for implementation activities. NOAA shall provide State coastal management programs with funds to implement management plans.
- Proposals to amend section 320 by prescribing specific actions for pollutant reduction in designated estuaries would not allow States the flexibility required to address pollution in accordance with the priorities established for each waterbody.

Title VI of the Clean Water Act, which authorizes grants for State Revolving Loan Funds, should be amended to:

- Authorize a set-aside (with a graduated increase from 2.5% to 10%) of SRFs for funding the implementation of NEP plans;
- Qualify States, which have approved CCMPs, for additional SRF funding to be used to implement CCMPs. These "Estuary Funds" would be provided in addition to a State's regular SRF allocation;
- Require States which have approved CCMPs to set up a special account within their SRFs to manage the disbursement of those funds and reduce State matching requirements from 20 percent to 15 percent; and
- Authorize States, which are implementing CCMPs, to utilize additional funding mechanisms designed to assist financially restricted communities, including but not limited to, extended loan amortization periods (up from 20 years to 40 years), no interest loans, and principal subsidies.

RATIONALE:

Greater Coordination Between the NEP and State CZM Programs - The most significant shortcoming of the NEP is the failure to institutionalize the NEP management plans. These plans contain recommendations, but do not contain enforceable policies.

An opportunity to institutionalize NEP management plans lies in their incorporation into State coastal management plans which are required to contain enforceable policies. The legislative history of the Water Quality Act of 1987 suggests that NEP management plans should be incorporated into State coastal management plans, but the extent to which this has been done varies. In some cases, the State coastal management agencies have not even been represented on the management conferences. A legislative directive is needed to ensure the full coordination between the NEP and State coastal management programs.

NEP Implementation Grants - Section 320 states that "Funds authorized to be appropriated under title II and VI and section 319 of this Act may be used in accordance with the applicable requirements of this Act to assist States with the implementation of such plan." In practical terms the amounts of money available to States for state-wide efforts under these programs is small and the portion of these moneys that a State could direct to their estuary programs would supply only a tiny fraction of the federal money required to leverage implementation action. Under the former Administration EPA's policy was not to provide funding for implementation activities. We believe, however, that after the development of CCMPs, the federal government cannot walk away and say that its participation is finished. If the NEP is to avoid repeating the mistakes made with other

planning provisions in the Clean Water Act, such as those under section 208, there must be federal assistance for implementation.

Separate Funding Authorization for CZM Activities in Fulfilling CCMPs - Effective coastal zone management programs are essential to the effectiveness of CCMPs. Federal "turf battles" over allocating funds should be avoided by explicit authorization for direct federal financial assistance to State coastal programs.

Maintaining a Flexible Approach to Water Quality Problems Through the NEP - Rather than prescribe specific measures to combat pollution in estuaries designated as of national significance, the National Estuary Program requires the convening of management conferences to decide what and how pollution problems can be best addressed. There is no single answer to abating water pollution within estuaries. A flexible approach is needed to address the various pollution problems around our nation's coast.

Although the initial results of the NEP are encouraging, it is premature to expand the geographic scope of the program to all degraded and threatened estuaries. Rather than spread limited federal and State resources over all degraded and threatened estuaries, efforts should concentrate on ensuring the success of the management plans currently being developed within the NEP.

## NONPOINT SOURCE POLLUTION

In the time since section 319 of the Clean Water Act was enacted in 1987, nonpoint pollution has gained even greater attention as a contributor to water quality degradation. Even while section 319 programs were being developed, Congress was retooling nonpoint source control efforts in coastal areas. The water quality provisions contained in section 6217 of the 1990 reauthorization of the Coastal Zone Management Act require State nonpoint source and coastal management programs to utilize both the best available technology (which is economically achievable) and water quality standards in coastal areas for controlling nonpoint sources. Those provisions establish ambitious objectives and mandate sanctions upon federal funding for nonpoint source and coastal management programs if those objectives are not timely met.

The COASTAL STATES ORGANIZATION recommends that Congress:

- Amend the sanctions provisions against CWA 319 and CZMA 306 to allow the Administrators of EPA and NOAA to have discretion to limit the use of sanctions only to situations of last resort. Good faith efforts on the part of States to meet section 6217 requirements should not be penalized, especially when adequate federal support for this mandated program has been lacking;
- Reconsider the appropriateness of sanctions if the technology-based requirements of the coastal nonpoint control program is expanded nationwide;
- Increase authorizations for nonpoint programs and expand the eligible uses of funds;
- Not require the development of a system for exchanging discharge credits between point and nonpoint sources of pollution.

### RATIONALE:

Implementation Deadlines for State Coastal Nonpoint Programs - Although the provisions of section 6217 of the Coastal Zone Act Amendments of 1990 set deadlines for program development, no timeframe requirements for implementation were prescribed. Nevertheless, EPA/NOAA guidance for coastal nonpoint programs require full implementation of management measures for all significant nonpoint sources within eight years of program approval. The magnitude of the problem of nonpoint pollution in coastal areas is at least equal to that of point sources, and the efforts to address those problems are likely to require a similar dedication of resources over a similar length of time. Congress should act through the Clean Water Act reauthorization to recognize the need for flexibility in timeframe requirements for implementing coastal nonpoint source programs.

Removal of Mandates for Sanctions - Congress should act to remove the mandate for sanctions against States which fail to develop approvable coastal nonpoint source programs. The federal

appropriation for the first two years of development of coastal nonpoint programs was \$2 million. This amounts to less than \$70 thousand dollars per State. Sanctions would be applied against all CZMA §306 and CWA §319 funding and the many uses to which these funds are put in meeting coastal management needs, unfairly penalizing other coastal program objectives for the reason of inadequate federal support for the development of State coastal nonpoint programs.

Discharge Trading Credits - While the exchange of discharge credits between point and nonpoint sources may have been successful in some instances, Congress should not adopt proposals to mandate States to develop discharge credit exchanges. The example that the Clean Air Act provides with its "bubble" allowances is not analogous to water pollution from point and nonpoint sources. The types of pollutants from point and nonpoint sources are usually dissimilar, and have different impacts on the aquatic environment. Moreover, such a system could be used to legitimize unwarranted increases in pollutant sources at a time when EPA is emphasizing pollution prevention.

## WETLANDS

The COASTAL STATES ORGANIZATION recommends that:

- Congress look with caution towards proposals to classify wetlands and recognize the distinction between wetlands classifications and ranking wetlands by value and function;
- Wetlands delineations be scientifically based upon regionalized criteria;
- Goals and objectives relating to wetlands protection be specifically stated for the section 404 regulatory program;
- Corps authorized mitigation projects be subject to State and federal resource agency review;
- Mitigation and restoration requirements be tailored to regional differences;
- The provisions of section 404 governing general permits be amended to include reporting and monitoring requirements, and notice to and opportunity for comment by State and federal resource agencies;
- The general permit provisions be further amended to clarify that general permits are not available for use within a State which has denied water quality certification or found the general permit to be inconsistent with enforceable policies contained in its federally approved coastal management program;
- States be encouraged with federal funding to assume the 404 program responsibilities and allowed flexibility in adopting their own programs;
- Congress encourage through federal financial and technical assistance the development of State wetlands conservation programs which identify wetlands by classification and function, and establish management strategies, timetables, and monitoring mechanisms for wetlands preservation, enhancement, and restoration.

## RATIONALE

Forging an agreement among the divergent views on wetlands protection poses the most formidable challenge of the Clean Water Act reauthorization. Even among the States, there appears to be no consensus on all of the proposed changes to the federal wetlands program. Nevertheless, there are some changes upon which the States are able to agree.

Wetlands Delineation Manual - The definition and delineation of wetlands should have a sound scientific basis. The taxonomic classifications of wetlands is already well established, though the ability to derive wetland values based on functions is less precise. Problems with the scope of the federal wetlands protection program should be addressed by recognition that some wetlands are deemed worthy of less protection than others, rather than redefining "wetlands."

Goals and Objectives of the Section 404 Program - As a regulatory program, the section 404 program is flawed in that it regulates with no direct goal or objective. The connection in the minds of the public between the Clean Water Act's goal of preventing water pollution and that of wetlands protection is not apparent. Explicit statutory language for the protection of wetlands is needed.

Mitigation - Although mitigation can be a useful tool for wetlands protection programs, close scrutiny is needed of the appropriateness of its use in off-setting wetlands losses and long-term effectiveness. The Corps should be required to solicit review of mitigation proposals by State and federal resource agencies.

General Permits - Circular reasoning pervades the administration of the Corps general permit program. The nationwide permits only authorize activities which have a minimal impact on the aquatic environment. Because the impact of authorized activities is minimal, the Corps finds that there is no need for reporting requirements for most of the nationwide permits, nor for monitoring. The Corps dismisses challenges to the validity to their assumptions by responding that there is no evidence that use of nationwide permits has resulted in adverse impacts individually or cumulatively. It is widely believed that the purpose of environmental protection through section 404 has taken a "back seat" to allowances for expediency through the nationwide permit program. Unreported and unmonitored activities authorized by the nationwide permit program number in the tens, if not hundreds, of thousands; yet, only anecdotal evidence is available about their impact. Although the assessment of cumulative impacts is a statutory requirement, it is doubtful that the Corps has ever considered cumulative impacts in the administration of the nationwide permit program. Reporting and monitoring requirements need to be statutorily mandated by the Clean Water Act.

State Authority Over Nationwide Permits - In the recent (January, 1992) reissuance of the nationwide permits, the accompanying program regulations qualify the scope and effect of State authority to review the nationwide permits. Under the regulations, the Corps has determined that it has the authority to decide which discharges are subject to State water quality certification authority. The Corps has also determined that where a nationwide permit has been denied, State water quality certification or found to be inconsistent with the State's federally approved coastal management program, the nationwide permit may still be utilized within the State so long as the permit applicant receives an individual certification or concurrence from the State first or waives its authority either expressly or by failure to act upon the application within 30 days. Furthermore, where a State has conditioned the use of a nationwide permit, the Corps has decided that it may treat those conditions as a denial by the State. The Clean Water Act should be amended to clarify that it is solely the prerogative of the State to determine which discharges are subject to

water quality certification authority and that no nationwide permits shall be available where a State has denied certification or found the nationwide permit to be inconsistent.

State Wetland Conservation Plans - Although the federal government maintains authority by virtue of its sovereign power to maintain the servitude over navigable waters, it is the States who have the primary interest over lands and waters that comprise wetlands. Both the States' sovereign and proprietary interests lie over these lands. The joint federal/State interest in protecting wetlands should be furthered through federal financial and technical assistance for the development of State wetland conservation plans. These plans should identify wetlands and associated uplands, contain management strategies, and provide monitoring, mitigation, restoration.

**Statement by Paul H. Woodruff, P.E.  
Chairman, Water Quality 2000 Steering Committee  
before the  
Water Resources and Environment Subcommittee  
Committee on Public Works and Transportation  
U.S. House of Representatives  
March 31, 1993**

Good morning, Mr. Chairman and distinguished members of the Subcommittee. My name is Paul Woodruff, and I am president of Environmental Resources Management, Inc., a consulting firm based in Exton, Pennsylvania with over 70 offices around the world. I founded ERM in 1977, and have over 30 years of experience in the water and environmental management field. I am also past chairman of the Government Affairs Committee of the Water Environment Federation, a 40,000 member non-profit educational and technical organization founded in 1928. I have served since 1989 as chairman of the Steering Committee for Water Quality 2000, and it is in this capacity that I appear before you today.

Water Quality 2000 is a cooperative effort of some 75 organizations, including industry, environmentalists, federal, state and local government, professional and scientific societies, and academics. Our mission is to "...propose and promote national policies and goals for the 21st century that will protect and enhance water quality, with a specific agenda for action."

The Clean Water Act is arguably our most successful environmental statute. Even so, implementation of water quality goals and policies has been complicated by conflict between competing interests, an emphasis on the short-term, and a patchwork quilt of narrow, sometimes conflicting laws and regulations.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 2

As we approached the 20th anniversary of the Act, leaders of the Water Environment Federation and other organizations felt it would be appropriate to step back, take a thoughtful look at our current programs, and identify appropriate new approaches for the 1990s and beyond.

Although not formally incorporated, Water Quality 2000 has operated since 1989 under by-laws which spell out our governance process and the rights and obligations of each member organization. Our funding has come from a variety of sources, including government and foundation grants and contributions from the member organizations. We have an elected, 20 member Steering Committee which is representative of the membership at large. I am joined today by Bob Adler, senior attorney for the Natural Resources Defense Council and Steering Committee vice chairman, and other members of the Steering Committee.

Publication of the Water Quality 2000 Final Report, A National Water Agenda for the 21st Century, is a significant milestone in the national clean water debate. This report presents the consensus views of a diverse coalition of interests on the need for fundamental changes in U.S. water policy.

We believe our report provides a sound conceptual framework within which to consider improvements to the Clean Water Act and other laws. Although our report does not focus primarily on the Act or on legislative matters, it does contain many specific recommendations which we hope will be of assistance to the Subcommittee.

When we began Water Quality 2000, the first thing we agreed on was a Vision Statement: Society living in harmony with healthy natural systems.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 3

We used our Vision Statement as a yardstick to see where we stood. Our Interim Report, completed in 1991, found that although substantial progress has been made in water quality improvement since the passage of the 1972 law, and many billions of dollars have been spent, more needs to be done to achieve the broad objective of the Act to restore the physical, chemical and biological integrity of the Nation's waters.

The Interim Report identified a series of impediments--technical, financial, institutional, and social -- to continued progress, and concluded that: "Focusing attention on the societal causes of water quality problems is essential if we are to articulate long-term solutions in which societal goals are compatible with clean water."

The Final Report responds to this conclusion by presenting some 85 specific recommendations for improvement, within the framework of an integrated, holistic national water resources policy. These recommendations were developed using a participatory work group approach that involved over 100 experts from a variety of interests and disciplines. The report has been endorsed by 64 organizations to date (our federal agency members are non-voting). While consensus was not achieved on every subject, there is broad support for the overall policy direction.

The report articulates eight "Guiding Principles" for a national water policy:

1. Water resources must be protected to sustain environmental values and the health of the economy;

Statement by Paul H. Woodruff, P.E.

March 31, 1993

Page 4

2. protection efforts must emphasize avoiding or minimizing pollution and resource degradation rather than mitigating their effects;
3. protection efforts must involve cooperation between all levels of government and the private sector, with the level of government most appropriate to the problem principally responsible for the solution;
4. protection efforts should focus on environmental results within appropriate hydrologic units or watersheds, with successes and failures in attaining water resources goals regularly reported to the public;
5. protection efforts should adopt a holistic perspective, taking into account the interconnectedness of quantity and quality of surface water, groundwater, and aquatic and related land resources;
6. protection efforts should include a mix of voluntary and mandatory approaches;
7. protection efforts must be based on a sound scientific understanding of both the natural and artificially altered environments and their interaction; and
8. protection efforts should be designed to ensure that beneficiaries of investments in water resources pay the full cost of these investments, while contributors to

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 5

water quality impairment fully internalize the cost of their polluting activities.

Building on these principles, the report goes on to identify three strategies for implementing an integrated, holistic national water policy: 1) preventing pollution; 2) increased individual and collective responsibility for protecting water resources; and 3) watershed-based planning and management.

Integrated means a policy that protects surface, ground and coastal waters, and habitat.

Holistic means a policy that considers human health, water supply, and ecological concerns and avoids simply transferring pollution from one medium to another.

Pollution prevention means that we must manage our affairs -- how we live, farm, work, recreate, consume, and transport-- so that as a society we generate less pollution and manage the wastes we produce better. Our recommendations for pollution prevention include a mix of voluntary and mandatory measures to promote continuous improvement in all sources and sectors. This includes agriculture, manufacturing, land development, energy, transportation, commercial activity, and individual households. Prevention is particularly important as a strategy for controlling runoff from agricultural and urban lands, our biggest remaining water quality challenge.

Increased individual and collective responsibility means we must **empower** the American people to adopt a heightened sense of responsibility for protecting water resources. It also means that all of us must contribute our fair share to the cost of cleanup and prevention. Responsible behavior -- in households,

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 6

on farms, and in factories -- should be encouraged through education, incentives, and yes, sometimes, regulation.

Implementation of watershed planning and management is central to all of our other recommendations. One of the biggest institutional impediments to progress is the fact that water programs are typically created and managed along political boundaries. Nature, of course, does not recognize political boundaries. Watersheds are the logical hydrologic unit within which to plan, implement, and evaluate our prevention efforts. Water Quality 2000 advocates a nationally coordinated program, with regional watershed planning and management organizations for all 21 U.S. water regions.

Watershed planning and management is not a new idea. Although areawide planning was a major feature of the original Clean Water Act, this approach was not fully embraced in the 1970s or 1980s. For a variety of reasons, we believe the nation is now ready, and indeed must, embrace this approach. Our ability to monitor and model is much greater than it was twenty years ago. Many of the gross, obvious water pollution problems have been addressed. More importantly, the magnitude and nature of our remaining problems, in particular the problem of urban and agricultural runoff, makes a standardized, national approach impractical and unlikely to be successful.

In fact, a 1976 report prepared for the National Commission on Water Quality stated that: "Any effective strategy for control of nonpoint sources within the framework of the Act can only be a product of the areawide planning process."

The watershed approach allows us consider cumulative impacts, and make rational decisions concerning the allocation of limited financial resources. For example, whether in a given

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 7

watershed it would be more effective -- in terms of improving water quality -- to spend \$20 million for improvements in municipal wastewater treatment plants or to spend the same amount helping to implement best management practices for agriculture.

Our report includes the following specific recommendations for implementation of watershed-based planning and management:

- Congress should create a new nationally coordinated program of watershed planning and management, including a mandate for implementation of activities as a condition of participating in planning.
- Congress should impose no particular management form on the states and should build upon existing watershed mechanisms. However, planning and management institutions should be required for all 21 of the major water regions of the United States.
- As requested by states, Congress should encourage, authorize, and approve the creation of interstate regional mechanisms, including joint federal-state compacts, to plan and manage water resources.
- Watershed planning and management institutions should be nested, to reflect the multiple orders of progressively larger watersheds. Institutions created to plan and manage smaller watersheds should participate in planning and management of the large watersheds to which they belong.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 8

- Watershed planning and management institutions should plan for protection of groundwater resources that cross watershed boundaries.

Many of the other recommendations in our report, including all of the pollution prevention recommendations, can and should be implemented locally within the watershed context. Other specific actions well-suited to the watershed approach include: water quality-based permitting for point sources; coordinating local and regional land-use and transportation planning with watershed protection goals; shifting water delivery systems away from political boundaries toward more efficient watershed boundaries; and management of runoff (including CSO abatement) in developed urban areas.

I would like to emphasize, Mr. Chairman, that our call for a nationally coordinated program is not meant to imply federal management of individual watersheds. The objective of a national program should be just the opposite: to empower watershed-based efforts the regional, state, and local levels. The federal role should be to provide leadership, coordination, technical assistance, and some financing; and to redirect existing programs to provide incentives and eliminate barriers to a holistic, integrated approach.

Mr. Chairman, I would like to provide you with a copy of an excellent background paper on watershed management in the United States which was prepared for Water Quality 2000 and request that it be made part of the hearing record, along with the Executive Summary of our Final Report.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 9

I would like to briefly highlight some of our suggestions that may be of particular interest to the Subcommittee. These relate to improved federal leadership in protecting water resources, pollution prevention, wetlands protection, and financing and incentives.

#### Improved Federal Leadership

The foremost responsibility of the federal government must be to provide leadership on societal change and adoption of a holistic approach. Federal agencies must implement their water resource programs in a coordinated manner, and should set an example for other levels of government, private landowners, and facility operators by assuming responsibility for compliance with federal laws and model land uses at all federal facilities.

- Congress should recognize the need for a new national water policy, and implement it through watershed planning and management. Recognition also means funding, through both traditional appropriations mechanisms and through user fees dedicated to specific activities.
- Congress should authorize and fund a new interagency water policy coordinating council, comprised of the major federal water resource agencies plus other federal agencies with authorities that can affect water quality.
- Congress should consolidate some or all of the 23 committees and subcommittees that have some jurisdiction over water issues. Water Quality 2000 identified conflicting and overlapping congressional

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 10

committee jurisdictions as a major impediment to enactment of integrated, holistic solutions.

- Congress should adopt a national policy of groundwater protection, and EPA should take the lead in forging a new intergovernmental partnership to protect groundwater. Under a new national policy, all states should adopt comprehensive programs that integrate groundwater and surface water protection activities. In our deliberations, Water Quality 200 could not agree on whether the federal government should play a more comprehensive role in establishing and overseeing groundwater protection activities.
- To enable us to accurately measure our progress, Congress should fully fund an adequate national system to integrate federal, state, local and private water quality monitoring. Monitoring should include ambient chemical, biological, and physical characteristics. Our present database is sparse and we frequently have to rely on indirect measurements.

#### Pollution Prevention

Our Final Report presents many specific suggestions for implementing pollution prevention in the following sectors: agriculture, forestry, land development, transportation, households, energy, and industry.

Pollution prevention efforts for nonpoint sources should have a priority commitment similar to programs now in place to address point and solid waste sources.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 11

Congress should strengthen, expand, and fully fund a national nonpoint source program under Section 319 of the Clean Water Act. This program should incorporate all sources, including agriculture, land development, transportation, and forestry.

Nonpoint source program components should include:

- EPA-approved enforceable state programs implemented in conjunction with regional watershed authorities;
- a combination of voluntary and targeted mandatory pollution prevention plans for individual land users;
- technical assistance programs administered by USDA and other agencies; and
- federal/state revolving loan funds to finance improvements by individual land owners.

Industry has a long history of preventing pollution without identifying it as such; industrial engineers have sought ways to improve productivity, which inevitably involved producing more product and less waste. Additional progress in the industrial sector should be encouraged in the following ways:

- increased incentives for industry to implement pollution prevention, including expanded reporting requirements under Section 313 of SARA to include a broader range of chemicals and manufacturing categories;

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 12

- establishment of a mechanism to ensure the development of facility-level pollution prevention plans;
- a collaborative effort to develop nationally consistent guidelines for facility-level plans;
- voluntary steps to review and modify internal processes or end products;
- regulation of product uses in appropriate situations; and
- development and refinement of life cycle analyses as a tool to identify pollution prevention opportunities.

Our report also includes specific recommendations for improvements to traditional point source control programs, such as expanding and improving water quality standards for toxics and other pollutants; developing sediment contaminant criteria; and supporting the development of additional industrial effluent guidelines.

#### Wetlands Protection

Wetlands help to reduce runoff and protect habitat impaired by runoff. As this Subcommittee knows, the nature and scope of federal wetlands protection efforts is an area where consensus has been particularly elusive. Water Quality 2000 suggestions would strengthen wetlands protection through changes to the Clean Water Act and by retaining and fully funding and implementing key provisions in existing laws, including the Clean Water Act and the Food Security Act.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 13

In particular, our report recommends that Congress expand the scope of activities covered by the wetlands program; strengthen the general permits program to prevent unacceptable cumulative losses; tie wetlands protection more clearly to state water quality certifications; and ensure that wetlands delineation is based on sound science; and provide tax and other incentives for protection activities.

#### Financing and Incentives for Water Resource Improvements

Spending for clean water programs should be viewed as an investment. For certain types of investments -- those that affect the nation as a whole -- Water Quality 2000 has suggested funding sources or strategies. For other types of investments, particularly those intended to support local programs or capital needs, funding strategies are best left to other forums where all interested and affected parties can debate the merits of alternative approaches. Adoption of a watershed approach should help to build a sense of individual stewardship and motivate citizens to make needed investments in resource protection.

Water Quality 2000 identified the following broad principles applicable across nearly all types of investments:

- The financing programs established for water programs must recognize that, in the end, we all contribute to water resources problems and we all must contribute to solutions.
- An appropriate federal share of funding for water quality improvements should ensure that: federal goals are reached expeditiously; federal spending does not substitute for state or local funds that would have

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 14

been spent anyway; and comparable environmental protection is afforded citizens of states with unequal resources or environmental problems.

- As part of a renewed federal commitment to financing water quality improvements, in part through general revenues, Congress should authorize general funds to capitalize state revolving funds to address the financing problems of small water supply and wastewater treatment systems.
- Watershed planning and management should be financed from multiple sources of funds to be made available by the federal government, participating state governments, local governments, and the private sector.
- Congress should review applicable tax laws and regulations with the purpose of eliminating disincentives and bars to capital fund raising and to level, as much as possible, the overall fund raising capabilities of public, private, and investor owned systems, regardless of their size.
- Congress should continue to implement existing federal economic incentives to farmers and private landowners to conserve resources and protect wetlands and riparian waterbodies.
- Permit programs (whether EPA or state managed) should be adequately funded through permit fees that are collected from permittees to serve as a dedicated source of revenue to support permit administration, including sampling and monitoring directly associated with that permit.

Statement by Paul H. Woodruff, P.E.  
March 31, 1993  
Page 15

- Federal, state, and local policies and regulations should put water utilities on a more businesslike basis by: ensuring that water is delivered to the customer at actual cost, plus a surcharge for maintenance and capital replacement; ensuring that revenues earned by any water utility are kept within the utility so that the utility is operated on a pay-as-you-go basis.

### Conclusion

Mr. Chairman, the pending Clean Water Act reauthorization is an obvious opportunity to make some of the changes advocated in our report. But although legislation is one, very important, way of effecting change, it is not the only or often not necessarily the best way. As our recommendations indicate, research, funding and incentives, enhanced state and local programs, and most important, education must all be part of the national water agenda. One of the pitfalls we must avoid is the tendency to believe that enactment of a new law (usually regulating someone else) will automatically solve the problem and allow us to go on with business as usual.

I appreciate the opportunity to appear before you today, Mr. Chairman. The Water Environment Federation and the other Water Quality 2000 member organizations welcome the opportunity to work with you and other members of the Subcommittee in the weeks and months ahead. This concludes my testimony.

## Water Quality 2000

### Vision Statement and Goal *(Adopted 5/19/89)*

- **Vision Statement:** Society living in harmony with healthy natural systems.
- **Goal:** To develop and implement an integrated policy for the nation to protect and enhance water quality that supports society living in harmony with healthy natural systems.

To achieve this goal, this policy should

#### CONSIDER:

- all phases of the water cycle, including groundwater, surface water, and atmospheric water;
- water as one part of a total environmental management plan, to avoid transferring problems from one environmental medium to another;
- the link between water quality and land use;
- the relationship between water quality policy in the United States and global environmental issues;
- the need to maintain a healthy economy.

#### PROMOTE SUCH STRATEGIES AS:

- source reduction and waste minimization;
- water conservation and reuse;

#### ASSURE:

- healthy aquatic, estuarine, and marine ecosystems;
- healthy drinking water supplies and adequate water quality for other uses;
- protection of human health from water quality hazards associated with recreation, fish and shellfish consumption, and other water uses.

## Mission Statement

Representing a broad range of interests in America, Water Quality 2000 proposes and promotes national policies and goals for the 21st century that will protect and enhance water quality, with a specific agenda for action.

In carrying out this mission, the following principles will be applied:

- Broad representation will be achieved;
- The perspective will be long-range, visionary, and holistic;
- Maximum consensus on "national principles" will be sought;
- Water quality, not water quantity, is the focus, but with a balanced view of surface, ground, and atmospheric waters; and
- The product of Water Quality 2000 will include a specific agenda for action.

The following Water Quality 2000 organizations have approved the Final Report as of March 31, 1993:

Academy of Natural Sciences  
 American Academy of Environmental Engineers  
 American Association of Port Authorities  
 American Consulting Engineers Council  
 American Farmland Trust  
 American Forestry Association  
 American Institute of Chemical Engineers - Environmental Division  
 American Planning Association

## I. EXECUTIVE SUMMARY

Under the nation's current clean water program, responsibility for pollution control is divided among the federal government, state governments, and a variety of local government entities. Within each level of government, there are usually a number of different agencies with water pollution control responsibilities. This complex institutional framework for governmental decision making often does not provide the flexibility to best address the nation's water problems. Numerous commissions established to study national water policy issues have recognized a need for intergovernmental coordination. Developing a capacity for effective intergovernmental decision making may require using a regional approach to solve water problems within the boundaries of natural water systems instead of political boundaries. The regional approach perhaps best suited to facilitate intergovernmental decision making processes is watershed planning and management.

Most natural events and human activities affect the quality of water resources principally within watershed boundaries. As a result, many argue that watersheds constitute the most sensible hydrologic unit for planning and implementation of actions to restore and protect water quality.<sup>1</sup> Because watershed boundaries usually do not coincide with the boundaries of political jurisdictions, it is difficult to develop policies, carry out comprehensive planning, and develop integrated solutions to pollution problems on a watershed basis.

U.S. Geological Survey surface water hydrological units provide consistently derived water body segments that can be used for watershed-based planning and management. There are four levels of hydrological units. The largest, called *regions*, encompass the drainage areas of major river systems. The 21 regions are divided into 222 *subregions*, 352 *accounting units*, and 2,150 *cataloging units*. This hierarchy provides the flexibility to address water quality problems at the most appropriate geographic scale. Although based on surface water boundaries, hydrological units may be used to address certain groundwater issues as well. Groundwater systems are usually spatially discontinuous and may vary widely in size. Thus, groundwater systems may be included within the boundaries of a surface water hydrological unit, which provides an opportunity to address the interactive nature of ground and surface waters.

The most appropriate institutional framework may vary for watershed planning versus watershed management because of functional distinctions between the two processes. While watershed planning involves thinking about the future, watershed management involves day-to-day resource management. Generally, water management has both structural and nonstructural components. Structural components include dams and reservoirs, locks and other channel improvements for navigation, irrigation projects, wastewater treatment plants, and stormwater facilities. Floodplain management programs exemplify nonstructural water management.

### **Why a Watershed-based Approach is Relevant to Solving Today's Water Problems**

The argument for a watershed-based approach is even more compelling given the nature of the water problems facing the nation today. While most of the national water quality effort

over the past several decades has relied on managing point sources of pollution, much of the remaining water quality problems across the country are attributable to runoff from agricultural, urban, and suburban lands. In contrast to the problems posed by a manageable number of point sources, whose discharges were relatively predictable and often controlled by standardized technologies, the problems associated with runoff are far more complex. Runoff problems often are related more to individual actions than to single pollution sources. In addition, both the quality and quantity of runoff depends on land use, which can change rapidly, and on rainfall, which is highly unpredictable. Given these conditions, runoff problems are best prevented or controlled on a watershed basis through individually developed strategies.

### **Watershed Planning and Management in National Water Policy**

Since the birth of our nation, the roles and responsibilities of the different levels of government -- federal, state, and local -- for managing water quality, water quantity, and aquatic resources have changed over time. The federal government made a notable attempt to implement a river basin approach to water resources planning under the Water Resources Planning Act of 1965. The current federal policy calls for allocation of greater responsibility for water planning and management to the states and local governments, thus fostering the use of political boundaries instead of natural water system boundaries.

### **Institutional Models for a Watershed-based Approach**

Models of watershed planning and management generally fall into four broad categories:

- (1) Interstate water management institutions, of which there are four general types, as follows:
  - *An independent authority.* Only one such authority exists in the United States, the Tennessee Valley Authority, which has broad powers to manage water resources with the goal of encouraging regional economic development.
  - *Federal-interstate compacts.* Federal-interstate compacts are interstate compacts to which the federal government is a signatory party. The Delaware and Susquehanna River Basin Commissions are the only examples of federal-interstate compacts.
  - *Interstate Compacts.* Interstate compacts are formed to coordinate management of a common water resource among states and primarily involve only state representatives as voting members. Such compacts are more widely used to allocate water, particularly in the western United States, than to manage water quality.

- *Cooperative Agreements.* Cooperative agreements are created through intergovernmental negotiation and formalized by the signatures of governors or mayors of participating state and local governments.
- (2) Intrastate water management institutions.
  - (3) Federally-mandated water planning programs.
  - (4) State water planning programs.

### **Dimensions of Effective Watershed Planning and Management**

Most water experts generally agree on the dimensions of effective watershed planning and management. These principles are outlined below.

#### Dimensions of Effective Watershed Planning

- The overall goal of watershed planning should be to develop a continuing process of consensus building -- not to develop a discrete plan. In the past, planning efforts often ended with the preparation of plans that were never implemented.
- The planning process must involve all levels of government, the private sector, and most importantly, the public. Furthermore, the planning process should help create mechanisms for intergovernmental coordination, which is critical to implementing watershed management programs successfully.
- Planning should have a strategic focus, that is, the consensus-building process should weigh and set priorities and identify emerging problems. Priorities should be evaluated using a holistic watershed-based approach to the prevention and control of pollution and habitat protection.
- Once priorities are agreed upon, watershed plans should recommend actions that will achieve environmental results within the watershed in the most efficient and effective way.

#### Dimensions of Effective Watershed Management

- Watershed management programs should be developed at the most appropriate geographic scale to address the specific problems identified in the planning process.
- Watershed management programs should develop mechanisms for intergovernmental decision making and coordination to implement basinwide management actions. Responsibility for other management actions should be allocated to the level of government -- federal, state, or local -- that can respond most effectively.

- Watershed-based programs should adopt a comprehensive management perspective -- that is, address the quality and quantity of surface and ground water, groundwater-surface water interactions, and the ecological health of aquatic and related land resources.
- Grass roots community involvement is essential to develop a strong local commitment for implementing watershed management programs. Public education and involvement is critical to developing political support for program implementation. Local government representation in management decision making helps build political support among local elected officials.
- Watershed management programs need well-defined channels to resolve disputes among water users or other affected parties.
- Agencies administering watershed management programs must have the legal authority to implement and enforce program requirements, whether management initiatives are implemented by regulation or by dispute resolution.
- A sound scientific understanding of the watershed is essential for effective management. Data collection efforts must be designed to provide the information needed for management decision making.
- Management programs should not focus exclusively on structural controls where nonstructural controls or education for pollution prevention, conservation, or resource protection are feasible means to solve water problems in a watershed. When needed, structural controls should be cost-effective.
- Watershed management agencies must have adequate financial resources to implement their program responsibilities. Where possible, financing mechanisms should be designed to recover the full costs of watershed management programs or services from beneficiaries or users.

## II. WATERSHED PLANNING AND MANAGEMENT IN NATIONAL WATER POLICY

Over the last 200 years, water policies have grown increasingly complex, as have the number of institutions and regulations put in place to manage water quantity, water quality, and aquatic resources. History suggests that solutions to water problems often begin with national water policy initiatives that are molded by social, economic, and political forces into water planning and management programs involving all levels of government and the private sector.<sup>2</sup>

Our federal system -- the framework for governmental decision making -- is characterized by multiple partners with formal and informal interactions. The U.S. Constitution gave specific powers to each of the three branches -- Executive, Legislative, and Judicial -- of the Federal government. All powers not given to the federal government were given to the states. States delegate certain powers to local general purpose governments, such as cities, townships, and counties. The federal system is dynamic as the roles and responsibilities of the three levels of government change over time and alternative institutions are created on a regional basis (interstate and intrastate) to address policy concerns that cross existing political boundaries.

Because water resources management is not mentioned specifically in the Constitution, it was first seen as a matter for private enterprise or individual landowners. In the early 1890s, officials of the Executive Branch of the Federal government resisted Congressional proposals to use federal funds for internal waterway improvements, based on the rationale that they would be unconstitutional because such improvements would primarily aid local private enterprises. A 1824 U.S. Supreme Court decision in the case of *Gibbons vs. Ogden*, however, provided a legal basis for the constitutionality of using federal funds for waterway improvements for navigation that involved interstate commerce. The federal role grew slowly, but steadily, to become the dominant force in U.S. water resources management from the 1930s until the late 1960s.

During the period from 1930 to late 1960s, Congress authorized many large scale projects to promote navigation and manage water quantity. Local interests could obtain federal funds for water resources development projects constructed by federal agencies. During this time, however, there was growing concern about the fragmented nature of water resources management. Both Congress and the Executive Branch established numerous commissions to study national water policy, many of which recommended improved interagency and intergovernmental coordination and some recommended a river basin approach to water resources planning and management.

The federal government attempted to implement a river basin approach to water resources planning under the Water Resources Planning Act of 1965. River basin planning activities under the Act, however, focused primarily on water resources development at a time when public concerns were shifting from water supply needs to water quality problems. The 1980s saw the demise of federal river basin planning efforts and the emergence of a federal policy to transfer greater responsibility for planning and managing both water quantity and quality to the states.

## 1890s and early 1900s -- Emergence of a Federal Role in Water Resources Management

Federal involvement in water resources management began with Congressional appropriations for projects to improve waterways for navigation. Such projects generally were authorized by omnibus rivers and harbors bills. A broader federal interest in water resources management began with the Swamp Lands Acts of 1848 and 1850, which authorized land grants to states in the lower Mississippi River Valley with the proceeds to be used for construction of flood control and drainage works. While little was accomplished, the Swamp Lands Acts set a precedent for federal involvement in water resources management beyond the purpose of navigation.

In the 1870s, policy makers recognized that flooding on the lower Mississippi River and the need to provide water supplies for irrigation in the western United States were problems that would require the federal government to assume additional responsibility for water management. In 1879, Congress authorized the Mississippi River Commission to make improvements for the purpose of preventing floods, but only to improve navigation and promote interstate commerce. Later, in 1917, Congress authorized and made funds available for flood control projects to protect the floodplain of the Mississippi River from inundation. The federal government began taking a direct role in developing irrigation projects under the Federal Reclamation Act of 1902. Because western states controlled the use of water within their boundaries, water management for irrigation was left to the states.

The concept of comprehensive water resources management on the basis of river basins was introduced by several reports under the administration of President Theodore Roosevelt -- at the height of the conservation movement during first decade of the 20th Century. The 1908 Inland Waterways Commission report and the 1909 National Conservation Commission report recommended comprehensive planning for all purposes (including water pollution control and other benefits derived from the use or control of water), equitable sharing of costs among beneficiaries, and creation of a National Waterways Commission to coordinate among all federal agencies involved in water resources activities. The National Waterways Commission was created, however, it only issued a report in 1912 recommending action to coordinate the work of federal agencies administering water resources development programs. The Newlands Commission was authorized in 1917 to coordinate federal water activities, but never created. Instead, the Federal Power Commission was created in 1920 to license hydroelectric power projects and develop comprehensive plans for water resources development, but these plans were never developed.

Under the 1927 Rivers and Harbors Act, the Corps of Engineers was granted authority to undertake basinwide surveys -- known as the "308 reports" -- to address navigation, flood control, hydropower, and irrigation potential as mandated by the 1918 Federal Power Act. While the Corps prepared such surveys for almost every river basin in the United States, they focused mainly on the need for large capital structures and federal water resources development projects.

In the late 1800s and early 1900s, protecting public health through implementing standards for sewage treatment was the responsibility of state governments. Scientific knowledge and technology made sewage treatment possible by the late 1800s. States established

sanitary commissions to prevent waterborne disease through treating drinking water and controlling water pollution from human sewage and refuse. Many larger cities established local sanitary commissions. During this period, the primary goal was elimination of typhoid and cholera epidemics caused by contaminated drinking water. The Rivers and Harbors Act of 1899 was the first law to recognize a federal authority in water pollution control. This Act, however, was limited to preventing discharge of refuse into navigable waterways.

### **1930-40s -- An Era of Large-scale Water Resources Development**

In the 1930s, the National Resources Committee and its successor, the National Resources Planning Board were created to develop comprehensive river basin development plans, but they lacked the authority to implement them. Instead, the federal Flood Control Acts of 1936 and 1938 used projects identified in the 308 reports as a basis for recommendations. These Acts led to an almost entirely federal program for dam and reservoir construction by federal water resources development agencies, often for the single purpose of flood control. The states had few rights and responsibilities and, in effect, U.S. water resources management became the purview of the Corps of Engineers and Bureau of Reclamation during an era of dam building. A broadening of the purposes of federal water resources construction programs occurred when the Flood Control Act of 1944 established recreation and the Fish and Wildlife Coordination Act of 1958 established fish and wildlife management as appropriate concerns of federal water resources management.

In 1933, Congress created the Tennessee Valley Authority (TVA) as an independent water management agency with a mission to promote regional economic development in the Tennessee River Valley. The TVA built 15 dams by the end of World War II. Although many regarded TVA as a success in promoting economic development, attempts to create similar authorities for other river basins in the United States were unsuccessful.

### **1950s-1960s -- The Federal Government Attempts to Implement a River Basin Approach to Water Resources Management and Begins to Address Water Quality as an Important Concern**

In response to concerns about federal water resources development projects and the lack of a comprehensive federal water policy, several efforts were made in the 1950s-1960s to establish a national water policy. The first Hoover Commission proposed, but never prevailed in, combining almost all of the federal water resources programs into a single cabinet department to minimize conflicts and centralize decision making. President Truman's Water Resources Policy Commission proposed, but never implemented, reinvolving states in the water resources management process under river basin commissions that would develop programs for comprehensive water resources management.

#### Senate Select Committee on National Water Resources

In the 1950s, Congress generally resisted efforts by the Eisenhower Administration to reduce federal responsibility for water management and curtail federal water resources

development programs. The Senate created a Select Committee on National Water Resources to establish a basis for national water policy. A report to the Committee on water pollution control needs by the Public Health Service introduced the concept of water quality management as a way to meet water quantity needs.

In its 1961 report, which many regard as a landmark, the Senate Select Committee on National Water Resources recommended that the nation's water needs would be met most efficiently if 80 percent of the federal investment was for water pollution control and 20 percent funded water resources development. The Committee also recommended coordinated intergovernmental water resources planning, scientific research, periodic assessments of water supply-demand relationships, and grants to the states to stimulate their participation in water programs.

### Water Resources Council

The Water Resources Planning Act of 1965 established the Water Resources Council (WRC) to implement a national strategy for planning for water and related land resources in 21 water regions. The Act took some of the steps outlined in the Senate Select Committee's report. In addition to creating the WRC, the Act began the most notable of the federal attempts to implement the river basin approach to water resources planning (see discussion of Title II River Basin Commissions in Chapter III).

The WRC was established within the Executive Branch and the statutory members consisted of the cabinet secretaries relevant to water resources -- the Secretaries of Interior; Agriculture; Army; and Health, Education, and Welfare; and the Chairman of the Federal Power Commission. Under the Department of Transportation Act of 1966, the WRC was expanded to include the Secretary of Transportation. In addition to these statutory members, WRC regulations provided for associate members that could participate in WRC meetings, but their concurrence was not required for WRC decisions. Associate members included the Secretaries of Commerce, and Housing and Urban Development, and the Administrator of the Environmental Protection Agency. The Attorney General, Chairman of the Council on Environmental Quality, Director of the Office of the Budget, and Chairmen of the Title II River Basin Commissions often participated in WRC meetings as observers.

Most of WRC's work was conducted by a council of representatives designated by the statutory members; the WRC staff; administrative and technical committees, which were composed of representatives of members, associate members, and observer agencies; and special interagency task forces. Under the Water Resources Planning Act of 1965, the WRC was mandated to:

- Prepare a national assessment of regional water supply and demand;
- Study the adequacy of regional and river basin plans, and existing and proposed policies and programs;
- Study the adequacy of administrative and statutory means for coordinating federal agency water resources programs and policies;

- Make recommendations to the President concerning water resources policies and programs;
- Establish (with presidential approval) principles, standards, and procedures for federal participation in river basin planning and for formulation and evaluation of water projects;
- Participate in the creation, operation, and termination of Title II River Basin Commissions, including review of river basin commission plans and submittal of such plans with WRC recommendations to the President; and
- Make grants to the states (under Title III) to assist them in comprehensive water and related land resources planning.

WRC activities focused on water resources development, with neither its river basin planning efforts or federal policy coordination effectively integrating concerns for water quality. In implementing the Act, the WRC assumed that rigorous planning principles, standards, and procedures would be an effective means of assuring that only projects meeting tests of national public interest would emerge from the planning process for authorization and construction. Instead, some felt that cost-sharing policy had a greater impact on the water resources planning process in the 1960s and 1970s than "principles and standards." Projects and project purposes tended to be planned and costed to maximize federal nonreimbursable costs, in effect, minimizing nonfederal reimbursable costs. These concerns led to efforts to reform cost-sharing policy beginning in the 1970s.

While the Water Resources Planning Act involved state representatives in the river basin planning process, it failed to encourage direct participation by representatives of local governments and the private sector. Lack of local representation made it difficult to develop local support for WRC's water resources planning activities. Political support for WRC activities was also adversely affected by the environmental movement that emerged in the 1960s, which questioned the justification for major federal water resources development projects. In the 1970s, the number of WRC meetings declined as well as the political support of the Secretary of Interior, who served as Chairman. In 1980, the Reagan Administration abolished the WRC.

The Title III matching grants to the states for water resources planning under the Act encouraged the development of professional talent and planning activities at the state level. However, the Title III planning grants were abolished by President Reagan in 1981.

#### Federal Water Quality Legislation

During the 1950s, the federal role in managing the nation's water quality problems expanded slowly into the control of municipal sewage discharges on the basis of federal authority over interstate waters. The initial federal response, however, was not planning or regulation, but primarily grants and public works. The Federal Water Pollution Control Act of 1956 was the first of a series of laws that increased federal assistance to local governments for construction of municipal wastewater treatment facilities. The Act recognized the primary responsibility of

the states to prevent and control water pollution and imposed no federal mandates for state activities. The 1961 amendments to that Act, however, increased federal authority by redefining interstate waters to include coastal waters. With each new federal law, from 1956 to 1969, the level of federal grants grew, the percent of total costs covered by federal grants increased, and the types of costs considered eligible under the federal grant program expanded.

With the Water Quality Act of 1965, the concept of water quality standards became an important feature of federal law. States were required to develop state water quality standards for interstate waters. The Federal Water Pollution Control Administration was created to establish broad guidelines, and revise or reject state standards. At this time, however, there was little attention to nonpoint sources of water pollution, groundwater contamination, loss of aquatic habitat, and the environmental and human health threats of unrestricted discharge of toxic pollutants into the nation's waters.

#### National Water Commission

Created in 1968, the National Water Commission began a 5-year analysis of national water policy. The Commission concluded that many of the federal programs created decades earlier had outlived their usefulness and emphasized the need for a shift in focus from water quantity to water quality and environmental protection. The Commission recommended that users of water and water-related services -- including navigation, irrigation, and flood control -- should pay the full costs of providing those services; programs with largely localized benefits should be planned, managed, and financed locally; and polluters should pay the costs of restoring their effluent to usable quality. Congress took no action on these proposals, and in fact, some might argue that they went in the opposite direction by authorizing dramatic increases in federal responsibility for water quality under the Federal Water Pollution Control Act Amendments of 1972. After the Colorado Basin Projects Act of 1968, however, there were no further authorizations of water resources development projects on the scale of the 1940s-1950s.

#### **1970s -- Increasing Federal Role in Pollution Control**

Public concern over environmental problems had grown throughout the 1960s and Congress responded by increasing federal responsibility for pollution control. During this time, environmental concerns expanded beyond municipal and industrial water pollution control to include protection of the recreational and amenity value of the nation's waters. The environmental movement in the 1960s also led to increasing emphasis on nonstructural water resources management programs (e.g., floodplain management) over construction of water resources development projects. The National Environmental Policy Act of 1969, which required preparation of an environmental impact statement on every major federal action, brought increased attention to environmental quality concerns in federal project planning. The shift to nonstructural management and environmentalist opposition to large federal projects led to a declining federal role in water resources management.

### Clean Water Act

The Federal Water Pollution Control Act Amendments of 1972 (known as the Clean Water Act) was enacted in response to public pressure to solve water quality problems. Under the 1972 Act, the federal government assumed the dominant role in defining and administering water pollution programs to control conventional pollutants, through the newly established Environmental Protection Agency (EPA). The Act instituted broad federal authority over all public waters and established two national goals:

- (1) Eliminating the discharge of pollutants into navigable waters by 1985 (the zero discharge goal); and
- (2) Achieving, wherever attainable, a water quality that protects fish, shellfish, and wildlife and provides for recreation in and on the water by July 1, 1983 (the fishable and swimmable goal).

The 1972 Act authorized an \$18 billion program of federal grants to states and local governments to build municipal wastewater treatment plants, with EPA establishing standards for their construction. The Act created a regulatory mechanism requiring uniform technology-based effluent limitations for industrial dischargers, instituted a national permit system for all point source dischargers, and initiated a program designed to identify nonpoint source contamination. The 1972 Act also initiated four new planning programs: state program plans, municipal wastewater treatment facilities plans, areawide waste treatment management plans (Section 208), and basin planning (Section 209). While Section 101(a)(5) declared that the areawide waste treatment management planning process should be developed and implemented as a national policy, planning efforts lagged far behind the treatment plant construction program.

In the 1972 Act, Congress also established the National Commission on Water Quality to evaluate whether the Act was achieving its goals and to recommend mid-course corrections. In its 1976 report, the Commission concluded that Congress significantly underestimated the time and resources that would be needed to achieve the goals of the Act, that the Section 208 planning process was not working, that the Act appeared to offer little opportunity to attain control of runoff under any of its provisions, and intergovernmental responsibilities were still in flux. The Commission was unable to reach unanimous agreement on a single set of recommendations to improve the nation's clean water program.

The Clean Water Act of 1977 was the beginning of a Congressional policy to delegate implementation of federally-mandated water quality programs to the states. States were urged to accept delegation of the national permit system and assume management of the construction grants program. The 1977 Act also broadened the federal program to include control of priority toxic pollutants.

## **1980s -- Allocation of Greater Responsibility to the States for Pollution Control**

Since the late 1970s, Congress has passed an increasing number of laws requiring state implementation of federal environmental policies. Allocation of greater responsibility to the state and local levels has been accompanied by declining federal financial assistance for water pollution control, water resources, and recreation resources programs.

Provisions of the Water Quality Act of 1987 explicitly and implicitly recognized that states have the primary responsibility to implement federal water quality policies. The 1987 Act provided for phasing out federal financial assistance for constructing municipal wastewater treatment facilities by 1994. The Act reflected increasing awareness of the significant contribution of nonpoint source pollution to surface water quality problems and groundwater contamination by adding Section 101(a)(7):

It is the national policy that programs for the control of nonpoint sources of pollution be developed and implemented in an expeditious manner so as to enable the goals of this Act to be met through the control of both point and nonpoint sources of pollution.

The 1987 Act added Section 319, which requires that each state develop and submit to EPA a comprehensive management plan to address nonpoint source pollution problems. Section 319 encouraged states to develop and implement their nonpoint source management plans on a watershed basis. In response to increased concern about pollution problems in coastal areas, the Act established the National Estuary Program (Section 320) to designate estuaries of national significance and convene management conferences to develop comprehensive management plans for such estuaries.

### III. MODELS OF WATERSHED PLANNING AND MANAGEMENT

Models of watershed planning and management generally fall into four broad categories, as follows:

- (1) Interstate water management institutions,
- (2) Intrastate water management institutions,
- (3) Federally-mandated water planning programs, and
- (4) State water planning programs.

Interstate and intrastate water management institutions have varying degrees of authority for both planning and implementation of water management programs. Such powers include the authority to own, construct, or operate facilities; regulate water quantity and/or quality; enforce regulations; and raise funds independently. In the past, federally-mandated water planning programs were generally characterized by weak linkages between planning and implementation. Some of the more recent federal planning programs (for example, the National Estuary Program) coordinate more closely the planning process and implementation efforts. Although there are a wide variety of approaches among state water planning programs, they are typically designed as consensus-building processes.

#### Interstate Water Management Institutions

A variety of interstate water management institutions exist. Types of interstate institutions include:

- **An independent authority.** Only one such authority exists in the United States, the Tennessee Valley Authority, which has broad powers to manage water resources with the goal of encouraging regional economic development. Strong efforts to establish similar authorities during the late 1940s and early 1950s for the Missouri and Columbia River Valleys were unsuccessful.<sup>3</sup>
- **Federal-interstate compacts.** Federal-interstate compacts are interstate compacts to which the federal government is a signatory party. Such compacts require approval of Congress and enable the signatory parties to participate jointly in the conservation, utilization, development, and control of water and related land resources in a river basin. The federal representative (a presidential appointee) has an important role in administering federal-interstate compacts, including voting rights. The Delaware and Susquehanna River Basin Commissions are the only examples of interstate water management institutions created by federal-interstate compacts.

- **Interstate Compacts.** Interstate compacts are formed to coordinate management of a common water resources among states. Such compacts primarily involve the states as voting members, although occasionally a federal representative has voting privileges. Interstate compacts are not binding on the signatory parties until they receive the consent of Congress and unanimous adoption by all affected states. Interstate compacts are more widely used to allocate water, particularly in the western United States, than to manage water quality.
- **Cooperative Agreements.** Cooperative agreements are created through intergovernmental negotiation and formalized by the signatures of governors or mayors of participating state and local governments. Because such agreements are not legally binding on the signatory parties, their success depends on strong political support.

#### Tennessee Valley Authority<sup>4</sup>

The Tennessee Valley Authority (TVA) was created by the Tennessee Valley Authority Act of 1933. TVA is an independent agency with broad powers to operate government-owned property, improve navigation in the Tennessee River, and control floods in the Tennessee and Mississippi River basins. A three-member full-time board, whose members are appointed by the President and confirmed by the Senate, directs TVA's water and related land resources programs. Under the 1933 Act and its amendments, TVA has a mandate to carry out an electric power program, a fertilizer program, and navigation, flood control, and watershed conservation programs. The Act authorized TVA to construct and operate dams and reservoirs in the Tennessee River and its tributaries to maintain a nine foot channel from Knoxville, Tennessee, to the mouth of the river. TVA was given regulatory powers, which include requiring TVA approval for any structures affecting navigation, flood control, or public lands; and regulation of activities that affect TVA reservoirs.

TVA's activities initially focused on constructing water resources development projects. Between 1933 and the beginning of World War II, TVA completed seven dams. During World War II, TVA completed eight dams.<sup>5</sup> All major TVA dams are multipurpose structures operated for flood control and navigation, electric power generation, water supply, and recreation. Hydropower and navigation channel improvements made the Tennessee Valley more attractive to industry. TVA considers the regional economic development that occurred during and after World War II as one of its major accomplishments. Construction of water resources development projects along the Tennessee River was essentially complete by the 1960s. Subsequently, TVA's power development program shifted to construction of coal-fired steam electric and nuclear power plants.

TVA conducts its watershed conservation activities under the Tributary Area Development Program (TAD). TAD first focused on retiring marginal land from row crop production to reduce soil erosion and stream sedimentation. Since the early 1960s, TVA has worked in cooperation with state and local agencies to combine water and related land resources development under TAD with regional planning for economic development. TVA's TAD activities include constructing water development projects (upstream reservoirs and channel

improvements), providing technical assistance, and planning. While TAD projects have no power or navigation benefits, they are justified for flood protection, recreation, municipal and industrial water supply, shoreline development, and water quality improvement. TVA is also involved in a program to help communities adopt nonstructural flood control measures, which includes planning studies and technical assistance.

Beginning in the late 1960s, the environmental movement strongly criticized TVA's water pollution control efforts and TVA's power program, which was associated with air pollution, thermal water pollution, and environmental degradations resulting from surface mining. In addition, the nine multipurpose dams on the Tennessee River and 24 other major dams on the tributaries transformed the Tennessee River into a series of lakes that were associated with growing pollution problems. TVA's appropriate role in abating the region's overall water pollution problems has been an agency concern since the early 1940s, when a TVA study documented growing industrial and municipal pollution in the Valley. This 1945 report did not propose a comprehensive program to abate water pollution because TVA lacked authority for implementation. Instead, TVA's water pollution control efforts involve cooperation with state agencies and private industry, with the agency's role limited to research and technical assistance.

#### Federal-Interstate Compacts<sup>6</sup>

The Delaware and Susquehanna river basin commissions are federal-interstate compacts involving states and the federal government as full members with voting rights. The compacts were approved by Congress and direct the commissions to develop and implement comprehensive plans, policies, and programs relating to the water resources of each basin; adopt and promote uniform and coordinated policies for water conservation, control, and development in each basin; and encourage the planning, development, and financing of water resources projects according to such plans and policies. The Delaware and Susquehanna river basin commissions are the only institutions created by interstate compacts that have regulatory powers to allocate water and control water pollution. In addition, they are the only two interstate water management institutions with extensive groundwater management powers.

The 1973 National Water Commission report, in its recommendations on interstate compacts, preferred the federal-interstate compact as the most effective institutional arrangement for water resources planning and management in multistate regions.<sup>7</sup>

#### *Delaware River Basin Commission<sup>8</sup>*

The Delaware River Basin Compact was the first interstate water compact to which the United States was a signatory party. The origin of the compact was a 1931 U.S. Supreme Court decision in *New Jersey vs. New York* that allocated water from the upper Delaware River for a reservoir to supply water to New York City. The four states of the Delaware River basin -- New York, Pennsylvania, New Jersey, and Delaware -- and the federal government began forming the compact in 1955 and it was approved by the four state legislatures and Congress in 1961.

The compact created the Delaware River Basin Commission (DRBC) with representatives from each of the four states and a federal representative appointed by the President (usually the

Secretary of Interior). DRBC has broad authority to develop plans and projects to manage the water resources of the basin, including water supply, pollution control, flood control, watershed management, recreation, and hydroelectric power. The DRBC was granted the power of eminent domain and the power to borrow money and issue bonds, but cannot pledge the credit of any party to the compact.

The compact directs the DRBC to develop a comprehensive river basin plan that includes specific water projects. The plan, and generally, any actions taken by DRBC must be approved by a majority vote of commission members. DRBC is authorized to review and approve federal and non-federal projects that affect water resources for conformity with the comprehensive plan.

DRBC has general authority to allocate surface and ground waters in the basin, largely in accordance with a 1954 U.S. Supreme Court decision. In addition, DRBC has regulatory powers to control withdrawals and diversions from surface and ground waters. DRBC can assume emergency water supply powers, which require unanimous consent of the members, to direct water withdrawals or reservoir releases during a drought or flood. The DRBC is also authorized to regulate water quality in connection with the comprehensive plan and issue orders to comply with its water pollution regulations.

DRBC's water quantity management activities are conducted according to its comprehensive plan. The current plan commits DRBC to meeting the water supply needs of the coastal plain within the Delaware River basin through conjunctive management of surface and ground water. The ability of DRBC to secure an adequate regional water supply, however, depends on the cooperation of the states to enforce groundwater pumping restrictions and to provide accurate information on groundwater withdrawals.

Because the federal government had one representative and one vote on the DRBC, federal agencies were concerned about their program and policy interests in the administration of the compact as originally proposed. In response, Congress included a reservation that the federal member had the right to nonconcur in any DRBC vote involving the comprehensive plan.

#### *Susquehanna River Basin Commission*<sup>9</sup>

The Susquehanna River Basin Compact was ratified by the States of Pennsylvania, New York, and Maryland in 1969 and approved by Congress in 1970. The compact created the Susquehanna River Basin Commission (SRBC), consisting of representatives from each of the three states and a federal representative appointed by the President. Each member of the SRBC has one vote and three votes are required to approve proposals for action.

The compact directs the SRBC to serve as the principal agency for coordinating federal, state, interstate, and nongovernmental plans for the water and related land resources in the basin. SRBC is authorized to prepare and adopt a comprehensive plan, allocate waters of the basin among the states, regulate withdrawals and diversions under certain circumstances, and assume jurisdiction over water quality if necessary to implement the comprehensive plan. Projects affecting water resources in the basin must be approved by SRBC, including federal projects when necessary to avoid substantial conflict with the comprehensive plan.

The compact contains federal reservations that limit the jurisdiction of SRBC with regard to water storage in projects authorized by Congress and the powers of federal regulatory agencies such as the Federal Power Commission or Atomic Energy Commission. In addition, the President may suspend, modify, or delete any provision of the comprehensive plan, as necessary in the national interest.

#### Interstate Compacts<sup>10</sup>

Interstate compacts are formed to coordinate and manage the use of water resources that cross state boundaries. Such compacts are not binding on the signatory parties unless they are approved by the U.S. Congress and adopted unanimously by the state legislatures of all affected states. Interstate compacts that primarily involve states as voting members (although occasionally authorize voting privileges for a federal representative) traditionally have been used in the western United States for the allocation of waters common to several states.

The first interstate compact for pollution control was the Ohio River Basin Water Pollution Control Compact Commission (now known as the Ohio River Sanitation Commission or ORSANCO), which was established in 1948. The ORSANCO compact was adopted by the legislatures of eight Ohio River Valley states and ratified by Congress. The Cincinnati Chamber of Commerce initiated the cooperative effort to solve the region's water pollution problems, which was joined by the state governors. The governors appoint 24 (three per state) of ORSANCO's 27 commissioners and the other three commissioners are presidential appointees. The Commission reimburses their expenses, but they are not paid. Each state's contribution to ORSANCO's budget is determined by a formula based on land area and population. In 1951, a U.S. Supreme Court decision ruled that member states have a legal and enforceable obligation to support the Commission and cannot unilaterally pull out.

The Potomac River Basin Compact was adopted by the states of Maryland, West Virginia, Pennsylvania, Virginia, and the District of Columbia during 1940-1945, but Congress never ratified the compact. The compact created the Interstate Commission on the Potomac River Basin. Three members of the Commission are presidential appointees and 15 are appointees of the governors and the District of Columbia. Like ORSANCO, each state's contribution to the Commission's budget is determined by a formula based on land area and population. The Commission's work is divided into four types of activities: public education; water supply, drought, and flood management; water quality; and stream restoration. Many regard the Commission's data collection and river basin modeling efforts, which have increased scientific understanding of the basin's water problems, as fundamental to its success.

Section 103 of the Clean Water Act provides that the EPA Administrator should encourage compacts between the states for the prevention and control of pollution. In addition, Section 103 grants the consent of Congress for two or more states to enter into agreements or compacts for cooperative effort and mutual assistance for the prevention and control of pollution and enforcement of respective state laws.

### Cooperative Agreements

Developed through intergovernmental negotiation, cooperative agreements are formalized by the signatures of governors or mayors of participating state and local governments. Because such agreements are not legally binding on the signatory parties, their success depends on strong state and local political support. The Chesapeake Bay Agreements are an excellent example of a successful intergovernmental cooperative agreement.

#### *Chesapeake Bay Agreements*<sup>11</sup>

The Chesapeake Bay restoration program began as a federal research study in the 1970s. In 1980, the legislatures of Virginia and Maryland established the Chesapeake Bay Commission to coordinate interstate planning and programs to restore and protect the Chesapeake Bay. The 1983 Chesapeake Bay Agreement, signed by Virginia, Maryland, Pennsylvania, the District of Columbia, the U.S. Environmental Protection Agency, and the Chesapeake Bay Commission, was a formal commitment to a basin-wide approach to restoring the Bay. The 1983 Agreement established a three-part organizational structure, including (1) the Chesapeake Executive Council to assess and oversee the implementation of coordinated plans to improve and protect the water quality and living resources of the Bay; (2) an Implementation Committee, appointed by the Executive Council, to coordinate technical matters and the development and evaluation of management plans; and (3) an EPA Liaison Office to support the restoration program. Under the 1983 Agreement, the members of the Executive Council were state and federal agency department heads.

In 1987, the Council formed a committee to develop a broader agreement addressing key issues and defining goals and milestones that would facilitate public accountability and further public participation in the Chesapeake Bay Program. The Council's Citizens Advisory Committee sponsored a series of nine public meetings to solicit comments on a draft agreement. Public participation made the final agreement a much stronger document.

The second Chesapeake Bay Agreement, signed in December 1987 by Virginia, Maryland, Pennsylvania, the District of Columbia, the U.S. Environmental Protection Agency, and the Chesapeake Bay Commission, went well beyond the original agreement. The 1987 Agreement lists specific goals, objectives, and 29 priority commitments in six categories: living resources; water quality; population growth and development; public information, education and participation; public access; and governance. The most specific and one of the most challenging commitments is achieving a 40 percent reduction by the year 2000 in the amounts of nitrogen and phosphorus reaching the Bay. In July 1988, the Council adopted a basin-wide strategy to reach that target, which describes reduction programs for the four jurisdictions. Other approved strategies address control or reduction of toxic and conventional pollutants, and development policies and guidelines.

Under the 1987 Agreement, the signatories themselves (the three governors, the Mayor of the District of Columbia, the EPA Administrator representing the federal government, and the Chairperson of Chesapeake Bay Commission) make up the Executive Council. EPA's participation became a statutory responsibility under the Water Quality Act of 1987, which also provided for continuation of federal grants to the states for Chesapeake Bay Program activities.

Seven other federal agencies with facilities near the Bay (i.e., the Department of Defense, Corps of Engineers, Soil Conservation Service, U.S. Geological Survey, Fish and Wildlife Service, National Oceanic and Atmospheric Administration, and the Federal Highway Administration) are cooperating in forming strategies that will control and reduce pollution from federal facilities.

The 1987 Agreement called for creation of a Local Government Advisory Committee to develop a strategy for local government participation in the Bay program. Some 2,000 local governments with diverse interests exist within the 64,000 square mile Chesapeake Bay watershed. Established in early 1988, the Committee consists of 20 representatives of varied levels of local government in Virginia, Pennsylvania, Maryland, and the District of Columbia.

### **Intrastate Water Management Institutions**

State initiatives for water planning and management vary widely. The diversity of approaches among the states reflects their differing physical, economic, social, cultural, and political characteristics. States have experimented with the design of local special districts and regional entities as intrastate water management institutions. Some states have designated basins with specific water resource problems for intensive management, particularly for groundwater management. Selected examples of intrastate water management institutions are described below.

#### *Texas River Authorities*<sup>12</sup>

The Texas river authorities have broad powers to develop, control, and protect the state's water resources at a regional level. Each river authority is created by a special act of the state legislature. River authorities are administered by a Board of Directors, which is composed of between 6 and 24 members who serve six-year staggered terms. In their enabling legislation, river authorities have been given powers and duties with respect to watershed management, water supply, pollution control and groundwater management, and hydroelectric power development. To date, flood control and water supply are two of the most important functions of river authorities. Although river authorities are recognized as government entities of the State of Texas, they do not receive any direct appropriations from the state.

#### *Florida Water Management Districts*

Due to continuing water problems, Florida enacted the 1972 Water Resources Act. The Act authorizes the Florida Department of Environmental Regulation (DER) to plan and manage the state's water resources, including development of a state water use plan that addresses all aspects of water management. Five regional water management districts, which conform to state water resources regions, have a significant role in administering the water program. Through boards appointed by the governor, the water management districts are responsible for managing water supply, water consumption, and flood control. Districts have authority to issue permits for surface and groundwater withdrawals and to levy ad valorem taxes to finance local water projects.

*Puget Sound Water Quality Authority*<sup>13</sup>

The Puget Sound Water Quality Authority (PSWQA) was established in 1983 to identify pollution problems affecting Puget Sound marine life, evaluate pollution threats to human health, and investigate the need for coordination among agencies responsible for protecting Puget Sound's water quality. PSWQA's initial recommendations called for preparation of a long-range comprehensive plan for Puget Sound and its related inland waterways to protect and improve water quality throughout the Sound. The planning area, which includes 12 counties, was defined by the state legislature in the Puget Sound Water Quality Act.

The principal responsibility of the PSWQA is to develop, adopt, and oversee implementation of the Puget Sound Water Quality Management Plan. PSWQA's enabling legislation requires state agencies and local governments to evaluate and incorporate applicable provisions of the plan into their policies and activities. PSWQA also has authority to propose funding mechanisms and new legislation as needed for implementation of the plan. As currently structured, PSWQA is an independent agency within the state government. An executive director is appointed by the governor to manage the work of PSWQA, including oversight of plan implementation.

Watershed planning is an important component of the nonpoint source pollution program in the *1991 Puget Sound Water Quality Management Plan*. The PSWQA, in cooperation with the Washington State Department of Ecology, has adopted a rule to provide direction for local implementation of watershed planning and management programs. The rule provides for watershed ranking committees in each of the 12 counties to develop priority rankings for local watersheds adversely affected by nonpoint sources of pollution. Watershed management committees will be formed in priority watersheds, consisting of a lead local agency (usually a county unless the watersheds are entirely within city or tribal boundaries) and representatives of other local government entities, special purpose districts, tribes, local planning agencies, the general public, and other affected parties. Watershed management committees will develop, adopt, and implement watershed action plans to prevent and reduce nonpoint source pollution within the watershed.

*Arizona Groundwater Management Areas*<sup>14</sup>

Arizona enacted a statewide program for groundwater management under the 1980 Arizona Groundwater Management Act. This legislation reached a compromise to respond to the growing conflict between municipal/industrial water demands and heavy use of groundwater for irrigated agriculture. The Act designated four active management areas (AMAs) and two irrigation non-expansion areas (INAs) with boundaries approximating major groundwater areas in the state. Within AMAs and INAs, groundwater withdrawals and use are managed to reduce and eventually eliminate groundwater overdrafting. Water conservation requirements for municipalities and industries are an integral component of the Act.

A recent survey found that at least 27 states, including Arizona, authorize the formation of special management areas to implement regional groundwater quantity management programs.<sup>15</sup> In some of these states, regulations to protect groundwater quality (such as land

use restrictions, agricultural fertilizer application rules, and wellhead protection plans) are used or authorized within such management areas.

### **Federally-mandated Water Planning Programs**

Federal statutes have mandated numerous water planning programs both for federal agencies and for implementation by the states and local governments. The sections below summarize only a few of these programs: the Title II River Basin Commissions, selected EPA planning programs, and Soil Conservation Service planning programs.

#### Title II River Basin Commissions<sup>16</sup>

Title II of the Water Resources Planning Act of 1965 (see discussion of the Water Resources Planning Act in Chapter II) authorized the establishment of federal-state regional institutions called river basin commissions. The Title II River Basin Commissions were planning agencies with no authority to own, construct, or operate projects; to regulate or manage river flow; or to regulate or manage water supply, water quality, riparian land use, or aquatic resources. Consequently, river basin commissions created under the Act had no direct powers to implement plans once they were developed.

The President established Title II River Basin Commissions by Executive Order upon written request of the Water Resources Council (WRC) or a state. The Act required the concurrence of WRC and at least half of the states in the area, basin, or group of basins involved before establishment of such commissions. If either the Upper Colorado River basin or Columbia River basin were to be included in a river basin commission, the Act required concurrence of at least three of four specifically named states in the basin. The President appointed the members of Title II River Basin Commissions, which included a chairman, representatives from each federal department or independent agency with substantial interest in the work of the commission, representatives from each state and any interstate compact agencies in the basin, and representatives from any international treaty organization with jurisdiction in the basin.

Seven Title II River Basin Commissions were established: the Pacific Northwest, Great Lakes, Souris-Red-Rainy, and New England in 1967, the Ohio in 1971, and the Missouri and Upper Mississippi River Basin Commissions in 1972. While the Souris-Red-Rainy River Basin Commission disbanded after completing a comprehensive plan, the other six commissions were active until President Reagan abolished the Title II River Basin Commissions in 1981.

Under the Act, the statutory duties of a Title II River Basin Commission were:

- To serve as the principal agency for coordination of federal, state, interstate, local, and nongovernmental plans for water and related land resources development in the basin;
- To prepare and keep up-to-date a comprehensive, coordinated, joint plan for development of the water and related land resources of the basin, including an

evaluation of alternative means of achieving optimum development and recommendations with respect to individual projects;

- To recommend priorities for data collection and analysis and for investigation, planning, and construction of projects; and
- To foster and undertake studies necessary to prepare its comprehensive plan.

Title II River Basin Commissions were required to submit their comprehensive plan to the WRC, which reviewed them and developed recommendations that were forwarded along with the plan to the President. The President reviewed WRC's recommendations and the comprehensive plan, and transmitted them to Congress with his recommendations. Title II River Basin Commission comprehensive plans typically placed a heavy emphasis on federal water resources development projects. The Title II River Basin Commissions also participated to varying degrees in other WRC planning activities, including regional or river basin studies (i.e., Level B plans).

Title II River Basin Commissions generally failed to involve local interests in the planning process as they had no direct representation on a commission. Consequently, river basin planning efforts did not engage local leadership and develop strong local political support. Moreover, a decline in political support for federal water resources development projects slowed Title II River Basin Commission activities. State and local governments began placing a higher priority on sewage treatment needs than traditional federal water resources development projects. In addition, flood control efforts shifted from flood protection via storage dams to floodplain management, which was largely a local program.

#### EPA Planning Programs

EPA programs that incorporate watershed-based planning or management are authorized primarily under the Clean Water Act (CWA). Watershed-based activities in CWA programs include:

- Areawide Waste Treatment Management Planning (Section 208),
- Interstate River Basin Planning (Section 209),
- State Nonpoint Source Management Plans (Section 319), and
- The National Estuary Program (Section 320).

In addition, the National Primary Drinking Water Regulations promulgated under the Safe Drinking Water Act (SDWA) require public water systems to maintain a watershed control program that minimizes the potential for microbiological contamination of the source water. Wellhead protection programs developed under Section 1428 of the SDWA may be used to meet these requirements for systems using a groundwater source under the direct influence of surface water.

*Areawide Waste Treatment Management Planning (Section 208)*

Areawide plans under Section 208 of the CWA were expected to coordinate all surface and ground water quality initiatives under a management strategy to control or treat industrial and municipal point sources, agricultural and urban runoff, silviculture, construction, mining, salt-water intrusion, runoff from solid waste sites, and accumulated sources of pollution such as deposits in harbors.<sup>17</sup> Despite a relatively comprehensive design, the Section 208 planning process failed to achieve its goals, largely because of program delays attributable to a lack of EPA guidance, state and local resistance to using Section 208 planning for land use control, and federal funding priorities that favored installation of point source controls in advance of planning.

*Interstate River Basin Planning (Section 209)*

Section 209 of the CWA required the Water Resources Council to prepare river basin plans (i.e., Level B plans), as required under the Water Resources Planning Act of 1965, for all basins in the United States by January 1, 1980. Section 209 also authorized funds to prepare the plans and called for giving priority to planning for areas with substantial water quality problems.

*State Nonpoint Source Management Programs (Section 319)*

Section 319, added by the Water Quality Act of 1987, establishes the nonpoint source management program mandated by the CWA. This program includes preparation of State Assessment Reports and State Nonpoint Source Management Programs. The advantages of watershed-based planning for nonpoint source controls are recognized in Section 319(b)(4) of the CWA, which provides that states should develop and implement their Nonpoint Source Management Programs on a "watershed-by-watershed basis" to the maximum extent practicable.

State Nonpoint Source Management Programs summarize state and local actions (i.e., best management practices) to control pollutant loadings from each category of nonpoint source pollution identified in State Assessment Reports. The state may take direct responsibility for implementation of the management plan or may designate local agencies as responsible for implementation of portions of the plan.

States must submit their Assessment Reports and Nonpoint Source Management Programs to EPA for approval. While all State Nonpoint Source Assessment Reports have been approved, some states have received only partial approval of their Nonpoint Source Management Programs. These delays are due, in part, to lack of adequate data to characterize the extent of nonpoint source pollution problems, the varying impacts of different categories of nonpoint source pollution on water quality, and the effectiveness of potential nonpoint source controls.<sup>18</sup>

*National Estuary Program (Section 320)*

Section 320, also added by the Water Quality Act of 1987, establishes the National Estuary Program (NEP). Section 320 calls for development and implementation of comprehensive conservation and management plans (CCMPs) that recommend priority corrective

actions and compliance schedules addressing point and nonpoint sources of pollution to protect and improve water quality and enhance the living resources of estuaries of national significance. For each estuary in the NEP, Section 320 authorizes the EPA Administrator to convene a Management Conference, consisting of representatives of federal, state, and local agencies, affected industries, academia, and the public. Management Conferences oversee studies and other planning activities, develop the CCMP, and implement priority actions identified in the CCMP. Currently, seventeen estuaries of national significance are in the NEP. The planning process and implementation efforts under the NEP have served to bring together a wide range of public and private interests within designated estuaries to work together on multi-disciplinary water quality improvement initiatives.

#### *Safe Drinking Water Act Regulations*

Section 141.71 of the National Primary Drinking Water Regulations promulgated under the SDWA requires public water systems to maintain a watershed control program that minimizes the potential for contamination by *Giardia lamblia* cysts and viruses in the source water. The states must review such programs, including an annual on-site inspection, to determine whether they are adequate to meet this goal. At a minimum, watershed control programs must characterize the watershed hydrology and land ownership, identify watershed characteristics and activities that may have an adverse effect on source water quality, and monitor the occurrence of such activities.

Public water systems must demonstrate through ownership and/or written agreements with landowners within the watershed that they can control all human activities that may have an adverse impact on the microbiological quality of the source water. Each system must submit an annual report to the state describing their watershed control program. Those systems using a groundwater source under the direct influence of surface water may use an approved wellhead protection program to meet these requirements if deemed appropriate by the state. Section 1428 of the 1986 SDWA Amendments requires that states establish wellhead protection areas and develop a program to protect the water supply within such areas from contamination.

#### Soil Conservation Service Planning Programs<sup>19</sup>

Under the Watershed Protection and Flood Prevention Act of 1954, the Soil Conservation Service (SCS) administers small watershed projects and river basin investigations, in cooperation with other federal agencies and the states. In addition, the SCS administers watershed projects authorized by the Flood Control Act of 1944 in 11 major watersheds (comprising about 30 million acres) in cooperation with other agencies.

#### *Small Watershed Program*

Small watershed projects are limited to a watershed area no larger than 250,000 acres by the Watershed Protection and Flood Prevention Act of 1954. Projects are typically multipurpose and may include flood prevention (defined by the SCS to include sedimentation control), agricultural water management, fish and wildlife development, municipal and industrial water supply, and public recreation. Such projects include establishment of conservation measures and construction of dams and other water control structures on upstream tributaries.

While small watershed projects may be developed on private and public lands, most projects are on private lands.

SCS planning procedures for small watershed projects require a great degree of local participation and also involve the states in the initial approval of applications and priority rating for approved projects. State agencies and qualified local agencies or nonprofit organizations sponsor or cosponsor projects. Qualified local sponsors include soil and water conservation districts or other special districts, municipalities, counties, and water users' associations. Local proposals are reviewed by designated state agencies, which also may provide financial or other assistance. Local sponsors acquire land and water rights, pay the local share of construction costs, award contracts for construction on private land or delegate contracting to SCS, and operate and maintain completed projects at their own expense.

The SCS provides technical assistance to help local sponsors develop a watershed plan, with the participation of other federal and state agencies. To receive federal assistance for structural flood control measures, local sponsors must obtain agreements from landowners to assure that at least half of the land above such structures is under basic conservation plans developed by landowners with technical assistance from soil and water conservation districts. Local sponsors receive federal financial assistance after a watershed plan is approved by the SCS, with the federal government paying the full cost of construction for flood prevention and providing cost sharing for other purposes, excluding water supply. Where a watershed plan calls for structures or improvements on public lands in a watershed, the responsible federal or state agency must install and maintain those measures.

The Small Watershed Program grew rapidly in the early 1960s and enjoyed strong grass roots support, in part because its planning process involved substantial local and state participation. In addition, the program was strongly supported by the National Association of Soil and Water Conservation Districts, which had played an important role in passage of the 1954 Act. However, because federal authorizations for planning assistance exceeded construction authorizations, a considerable project backlog had developed by 1970. Further program delays occurred as a result of environmentalist opposition to channel modification, which was a component of some small watershed projects. The SCS eventually modified its planning procedures to address more effectively the potential adverse environmental impacts of small watershed projects, particularly with regard to fish and wildlife habitat. The National Environmental Policy Act also played a significant role in SCS efforts to integrate review of environmental impacts into its planning procedures. The Small Watershed Program currently has 1,134 projects under construction in 49 states (excluding Rhode Island) and approved applications for projects covering 25,874,281 acres in 40 states.

#### *Interagency and Intergovernmental River Basin Planning*

Section 6 of the Watershed Protection and Flood Prevention Act of 1954 provides broad authority for USDA agencies to participate in interagency and intergovernmental river basin planning, surveys, and investigations. The SCS is the lead agency within USDA for such activities. In general, these cooperative river basin studies have had little influence on the selection of small watershed projects.

### State Water Planning Programs

The states take a wide variety of approaches to planning for water management. A recent report indicates that some 36 states support regional or river basin approaches to water management.<sup>20</sup> Typically, these efforts are designed as consensus-building policy making or planning processes where the states facilitate the creation and implementation of comprehensive water and related land resources management goals in cooperation with local governments and private interests. A good example of consensus-based water planning is the Kansas State Water Plan (which also has a permanent dedicated source of funding). However, many states would probably agree that reaching a consensus on comprehensive water management goals through their planning process presents many administrative and political challenges.

#### IV. DIMENSIONS OF EFFECTIVE WATERSHED PLANNING AND MANAGEMENT

The federal government and the states have undertaken a variety of attempts to establish regional programs and institutions for watershed planning and management and to ensure the intergovernmental coordination necessary for implementation of such programs. Based on a review of selected programs and institutions (summarized in Chapter III) and a literature review, the first two sections of this chapter outline the dimensions of effective watershed planning and watershed management, respectively. The specific points outlined below reflect basic principles generally agreed upon by water experts. In addition, they reflect the increasing complexity of U.S. water policy issues over the last 200 years (see Chapter II) and suggest a need for a national water policy institution to provide the necessary coordination and communication among levels of government and regional entities.

A number of studies, symposiums, and program initiatives have addressed issues associated with the effectiveness of watershed planning and management. The final section of this chapter summarizes the recommendations of two relevant studies and the goals of EPA's recent watershed initiative.

##### Dimensions of Effective Watershed Planning

- The overall goal of watershed planning should be to develop a continuing process of consensus building -- not to develop a discrete plan. In the past, planning efforts often ended with the preparation of plans that were never implemented.
- The planning process must involve all levels of government, the private sector, and most importantly, the public. Furthermore, the planning process should help create mechanisms for intergovernmental coordination, which is critical to implementing watershed management programs successfully.
- Planning should have a strategic focus, that is, the consensus-building process should weigh and set priorities and identify emerging problems. Priorities should be evaluated using a holistic watershed-based approach to the prevention and control of pollution and habitat protection.
- Once priorities are agreed upon, watershed plans should recommend actions that will achieve environmental results within the watershed in the most efficient and effective way.

### Dimensions of Effective Watershed Management

- Watershed management programs should be developed at the most appropriate geographic scale to address the specific problems identified in the planning process.
- Watershed management programs should develop mechanisms for intergovernmental decision making and coordination to implement basinwide management actions. Responsibility for other management actions should be allocated to the level of government -- federal, state, or local -- that can respond most effectively.
- Watershed-based programs should adopt a comprehensive management perspective -- that is, address the quality and quantity of surface and ground water, groundwater-surface water interactions, and the ecological health of aquatic and related land resources.
- Grass roots community involvement is essential to develop a strong local commitment for implementing watershed management programs. Public education and involvement is critical to developing political support for program implementation. Local government representation in management decision making helps build political support among local elected officials.
- Watershed management programs need well-defined channels to resolve disputes among water users or other affected parties.
- Agencies administering watershed management programs must have the legal authority to implement and enforce program requirements, whether management initiatives are implemented by regulation or by dispute resolution.
- A sound scientific understanding of the watershed is essential for effective management. Data collection efforts must be designed to provide the information needed for management decision making.
- Management programs should not focus exclusively on structural controls where nonstructural controls or education for pollution prevention, conservation, or resource protection are feasible means to solve water problems in a watershed. When needed, structural controls should be cost-effective.
- Watershed management agencies must have adequate financial resources to implement their program responsibilities. Where possible, financing mechanisms should be designed to recover the full costs of watershed management programs or services from beneficiaries or users.

### Relevant Studies or Initiatives

As Water Quality 2000 continues to examine watershed planning and management concepts, it is helpful to review the recommendations of two relevant studies -- the first by the U.S. Water Resources Council and the second by the U.S. Advisory Commission on Intergovernmental Relations -- as well as the goals of EPA's Watershed Protection Approach.

The Water Resources Council (WRC), which was mandated to study the adequacy of regional and river basin plans, commissioned a study of interstate arrangements for water resources planning. The study's 1980 report, entitled *Regional Water Resource Management Planning: Potential Interstate Institutional Entities for Water Resource Planning*, supported the previous position of the WRC that no single institutional arrangement for managing river basin operations was preferable over other alternative institutions. The report states:

For 65 years extensive institutional experimentation has taken place within the United States federal system as states and groups of states have sought to meet the objective of comprehensive, coordinated water resources planning and management. Most of the institutions developed during this period have been linked to, supported by, or have acted in collaboration with the multi-agency, congressionally controlled, water and related land resources programs of the federal government. The record also shows quite clearly that the nation has not been willing to substitute a single type of organizational arrangement such as new TVAs, basinwide state or federal-state compacts, river basin commissions or other entities for the mixed institutional system that now prevails.<sup>21</sup>

The 1980 WRC report identified a wide range of benefits that can be achieved from the planning process made possible by interstate institutions. Basin planning under interstate institutions can:

- Be designed in consideration of the specific problems of the basin;
- Reflect the unique physical, cultural, economic, and political character of the basin, and the relation of the basin to the adjoining region;
- Maintain, on a current basis, the most practical and effective allocation of functions and responsibilities among local, state, and federal entities where responsibilities are shared;
- Provide for a better responsiveness to the public who share the basin but not the same political institutions;
- Strengthen and support a continuous, comprehensive planning process;
- Provide more ready agreement on reserving some common interstate problems for the future;

- Provide an improved arena for conflict resolution while still preserving the essential prerogative of the Congress, state legislatures, and local general purpose governments;
- Provide a means for individual members to be aware of other members' actions and interests and of available or alternative means to implement programs not possible on an individual basis;
- Provide a guide to needed state/local action to support basinwide programs; and
- Allow for experimentation and program differentiation on a more manageable scale.<sup>22</sup>

Since this 1980 WRC report, the nation has focused much more attention on protection of groundwater resources, contamination of surface and ground water from nonpoint sources of pollution, and loss of aquatic habitat. Today, watershed planning and management must recognize that the boundaries of all water resource systems -- surface water systems, groundwater systems, or hydrologically interconnected surface and groundwater systems -- often do not coincide with state or local political boundaries or economic regions. In addition, comprehensive water management must address water quality and habitat protection in conjunction with the traditional water supply issues.

An October 1991 report by the U.S. Advisory Commission on Intergovernmental Relations (ACIR), entitled *Coordinating Water Resources in the Federal System: The Groundwater-Surface Water Connection*, found that the nation's current water resources problems are largely problems of insufficient interagency and intergovernmental coordination.<sup>23</sup> ACIR's recommendation on encouraging better coordinated governance of water resources includes recommending that state officials take action to promote water resource coordination:

The Commission recommends . . . that state government officials support and encourage coordinated use of water resources within their borders. Coordination mechanisms, which may include interjurisdictional arrangements as well as the creation of new public jurisdictions, should be empowered to undertake the range of functions necessary to coordinate the allocation, conservation, storage, and use of surface and underground water supplies, where coordinated use is appropriate. To the maximum extent feasible, in order to ensure sustainable programs of water resource development, use, conservation, and protection, these coordination mechanisms should be self-governing, directed by the water users themselves and the affected local and state officials. To the extent feasible, these governance structures should be self-financing, with costs assigned among benefited water users and local governments, and with financial participation by the states to the extent that benefits are statewide.<sup>24</sup>

ACIR's recommendation on encouraging better coordinated governance of water resources also includes recommending the use of interstate regions for water resource coordination where water resource systems extend beyond state boundaries:

Because many systems of surface and underground water resources extend beyond state boundaries, the Commission recommends that the Congress authorize and approve the creation of interstate regional mechanisms, including joint federal-interstate compacts, for governing the coordinated use of surface water supplies and storage with groundwater supplies and storage, where such coordinated use is appropriate. These interstate mechanisms, which will necessarily include interjurisdictional arrangements as well as new public jurisdictions, should be empowered to undertake the range of functions necessary to achieve coordinated use and conservation. Federal agencies involved in the operation of federal surface water projects should be directed to cooperate with the coordinated use programs of these interstate mechanisms. Except in clear instances of violation of federal laws or the United States Constitution, no federal official or agency should be authorized to withhold participation in or veto a coordinated water resource program established by interstate agreement. Interstate water resource coordination mechanisms should be (a) established pursuant to negotiations among the parties affected; (b) self-governing; (c) directed by representatives of affected state and local governments, the federal government, and water users; (d) self-financing to the extent possible; and (e) empowered to take effective action within the scope of responsibility agreed to. The Congress and the President should encourage the negotiation and approval of federal-interstate compacts in water resource basins where states request them.<sup>25</sup>

Finally, ACIR recommends federal restraint to allow maximum flexibility to state and local governments:

Because of the diversity of state and local government structures and responsibilities, as well as the diversity of water rights and water resources situations, the Congress and the Executive Branch should not impose any particular management form on states and local governments, whether through mandates or through conditions on participation in federal programs.<sup>26</sup>

EPA's Watershed Protection Approach<sup>27</sup> recognizes that the nation's current clean water program has failed to address overall ecological health and habitat health, often has not considered the cumulative effects of different types of pollution from different sources of pollution, and has not taken advantage of opportunities to involve local decision makers and other responsible parties in cooperative efforts to improve the ecological health of specific waterbodies. The Watershed Protection Approach is intended to be a mechanism that promotes incremental improvements in the nation's approach to watershed protection. The Watershed Protection Approach will provide a framework for cooperation among all levels of government and the public to target high priority watersheds and implement watershed-specific plans.

The overall goal of the Watershed Protection Approach is to reorient EPA and other federal agency, state, and local programs to address watershed protection in a holistic manner. Specific goals listed in EPA's draft goal statement are:

- To encourage state and local governments to target watersheds based on ecological risk;
- To encourage the development of site-specific watershed protection measures based on a holistic, integrated approach to address both traditional and non-traditional sources;
- To establish processes in which all decision-makers at all levels of government, different agencies, and other stakeholders work together to implement solutions; and
- To establish effective programs to measure success and continuous improvements.<sup>28</sup>

## ***Executive Summary***

### **Water Quality 2000 Phase III Report**

#### ***"A National Water Agenda for the 21st Century"***

**W**ater Quality 2000 is a cooperative effort of more than 80 public, private, and nonprofit organizations. In 1988, we began a four-phase effort to develop an integrated national policy for U.S. water quality and surface and ground water resource protection. This policy supports Water Quality 2000's vision — a society living in harmony with healthy natural systems. Our Interim Report, published in June 1991, identified problems with current water quality policies and programs. This report builds on that foundation to present consensus recommendations for improvement, as developed by over 125 individuals serving on five working groups and a Steering Committee. During the next phase of our work, Water Quality 2000 and the participating organizations will transmit these recommendations to Congress, the Executive Branch, state and local governments, business and professional leaders, and others whose actions influence water quality.

#### **The Condition of the Nation's Waters and Aquatic Habitat**

The Interim Report concluded that progress has been made in improving the condition of the nation's waters over the past 20 years, but, nonetheless, the national goal of "fishable and swimmable" waters has not been attained in many areas. Moreover, much work remains to achieve the broader, overall objectives of a wide range of water legislation, including the broad objective of the Clean Water Act — to restore and maintain the chemical, physical, and biological integrity of the nation's waters.

Conclusions about the condition of the nation's waters are complicated by the fact that data on water quality and the health of ecosystems are incomplete. Data on the release of contaminants is incomplete, covering only a fraction of all waters and typically, a small number of pollutants. The lack of such basic information leads to conflicting assessments of our progress. Evidence indicates that progress is being made. Nonetheless, reports demonstrate that surface waters are contaminated by siltation, nutrients, organic matter, and hazardous materials; groundwater contamination results from animal wastes, fertilizers, pesticides, and other agricultural sources, from industrial sources such as manufacturing processes, leaking underground storage tanks, and spills, and from interaction with contaminated surface waters; and wetlands and riparian areas continue to be destroyed or degraded by a wide variety of human activities. Some aquatic ecosystems are also stressed by changes in physical habitat, altered flows and water tables, overharvesting, and introduced species.

#### **Causes of Water Quality Problems**

The fundamental causes of current water quality problems lie in seemingly unrelated aspects of life: the way we farm, produce, consume, transport people and goods, and plan for the future. Many aspects of modern

life and our past practices put pressure on water quality. Until recently, these activities proceeded with little recognition of the degradation they caused to surface waters, groundwater, and aquatic habitat. When the conflicts between these activities and water quality were recognized, they were resolved through relatively narrow efforts focusing on the direct sources of impairment but not necessarily the root causes of the problem. Water Quality 2000's vision will be achieved only if we reshape societal functions in ways that are compatible with protecting water resources.

Sources that contribute to current water quality impairment include (in alphabetical order):

- agricultural activities;
- community wastewater discharges;
- deposition of atmospheric contaminants;
- industrial activities, including the manufacturing, service, power generating, and waste management sectors;
- land alteration, including logging, mining, road building, and commercial and residential development;
- stocking and harvest of aquatic species;
- transportation activities, including shipping, surface transportation, automobiles, pipelines, dredging, and facilities construction and operation;
- urban runoff, including municipal and industrial stormwater; and
- water projects, including dams, reservoirs, and channelization.

## Impediments to Solutions

In addition to societal factors, the Interim Report identifies seven impediments to further improvements in water quality caused by shortcomings in current water quality policies and programs. In the near-term, opportunities exist to improve water quality by addressing these seven impediments:

- ***Narrowly focused water policies*** impede holistic solutions that address cross-media effects, the connection between groundwater and surface water and between water quantity and water quality;
  - ***Conflicts among water quality institutions*** impede collaboration between all levels of government, the private sector, and individuals;
  - ***Legislative and regulatory overlaps, conflicts, and gaps*** create inefficient or ineffective solutions or leave water resources underprotected;
  - ***Funding and incentives for clean water*** programs are out of touch with public opinion and actual need;
  - ***Inadequate attention to the need for trained personnel*** has resulted in a serious gap between a limited supply of trained professionals and a growing demand for their skills;
  - ***Research and development programs are insufficient to meet the challenge*** posed by the complexity of today's water quality problems and the need to improve basic scientific understanding; and
  - ***Inadequate communication*** has resulted in a public that is largely unaware of the linkages between daily life and water resources, what they can do to improve water quality, and why they should care in the first place.
-

## Problems to Solutions

Public and private efforts to protect water resources have produced some successes, but there is significant room for improvement. Some problems have been solved, others await the results of programs only recently put in place, and others remain challenges for the future. Water Quality 2000 identified 12 such challenges for further consideration in Phase III:

- Preventing pollution,
- Controlling runoff from urban and rural lands,
- Focusing on toxic constituents,
- Protecting aquatic ecosystems,
- Coping with multi-media pollution
- Protecting groundwater,
- Increasing scientific understanding of water quality issues,
- Promoting wise use of resources,
- Setting priorities,
- Providing safe drinking water,
- Managing growth and development, and
- Financing water resource improvements.

Our development of recommendations for improvement was organized around these 12 challenges. Five "challenge groups" were formed to address specific concerns identified in the Interim Report against a backdrop of Water Quality 2000's Vision and Goal adopted in May 1989. The recommendations developed by these groups included many of the traditional tools for change — education, incentives, regulations, training, and research. But there were also several themes common to the work of all five groups that form the basis of an integrated strategy for protecting surface and ground water resources.

### *National Water Resources Policy — A First Step*

The United States has no unified national policy that observes the principles of integrated land and water resource planning and management. Instead, our water policies comprise a patchwork of narrow, often conflicting objectives; jurisdictional conflicts mark both the legislative and executive branches of the federal and some state governments; sound economic principles are often missing from resource allocation decisions; and many sources of water quality impairment remain unaddressed or underaddressed.

Water Quality 2000 concludes that a new national water policy is needed to integrate planning and management to protect surface and ground water resources with related societal activities under a watershed framework. This policy and a national strategy to protect water resources must be based on the principles of pollution prevention and resource conservation and must be designed to incorporate concern for water resources into every aspect of human activity. We must strive to integrate institutions, ecology, economics, and where appropriate, technology. We envision three strategies comprising our policy framework:

- Protecting water resources by preventing pollution;
- Empowering all segments of society to contribute to water resource improvements through increased individual and collective responsibility; and
- Planning and managing water quality and quantity on a watershed basis.

In short, an integrated, national policy that supports society living in harmony with healthy natural systems.

---

### Preventing Pollution and Water Resource Degradation

Avoiding the degradation of natural systems is preferable, on ecological and economic grounds, to mitigating damages after they have occurred. Generally associated with the industrial sector, pollution prevention is equally applicable and useful as a guiding principle for other sectors or sources of impairment. Water Quality 2000, therefore, recommends the following:

- **Nonpoint Sources (Runoff and Leachate)**

Congress should fully fund a strengthened and expanded national nonpoint source (runoff and leachate) pollution prevention program under Section 319 of the Clean Water Act that encompasses all sources of runoff and leachate including agriculture, land development, transportation, and forestry. Program components should include (1) EPA-approved, enforceable state programs to be implemented in conjunction with regional watershed authorities; (2) a combination of voluntary and mandatory targeted pollution prevention plans for individual land users, such as farmers; (3) technical assistance programs administered by USDA for the farm sector and other agencies as appropriate for the other sectors; and (4) new federal/state revolving loan programs to help finance improvements on individual tracts of land, such as farms or forest tracts.

- **Energy and Transportation**

Water Quality 2000's recommendations to promote pollution prevention in the energy and transportation sectors include: (1) enactment of a federal production tax credit for renewable energy supplies; (2) building and equipment energy-efficiency standards; (3) incentives to stimulate the use of mass transit in high-density urban areas; and (4) improved transportation fuel efficiency.

- **Industry**

To promote additional progress in pollution prevention for the industrial sector, Water Quality 2000 recommends (1) increased incentives for industry to implement pollution prevention; (2) the development of facility-level pollution prevention plans; (3) voluntary steps by industry to review and modify internal processes or end products; (4) government control of product uses in appropriate situations; and (5) a national effort to develop and refine life cycle assessment analyses as a tool for identifying opportunities for improved pollution prevention.

- **Households**

A series of actions are recommended to reduce pollution from the household sector: (1) industry should adopt product labelling practices that indicate materials and energy efficiency associated with consumer products; (2) local governments should undertake programs to make household pollution prevention easier; and (3) Congress and state and local legislatures should offer financial incentives to encourage individual actions to reduce pollution.

The Pollution Prevention Act of 1990 provided a much needed first step toward institutionalizing pollution prevention for all sources by declaring that pollution prevention was a "national objective." It will be critical for EPA and others to implement programs under this Act in full recognition of the need for broad application of pollution prevention principles to all media, all sources of adverse environmental effects, and all sectors of the U.S. economy.

### Individual and Collective Responsibility for Water Resources

Water Quality 2000's Vision and Goal can only be realized if the American people as individuals and collectively as members of the community adopt a heightened sense of responsibility for protecting water resources.

Although much can be accomplished through leadership and education, experience has shown that purely voluntary behavior will not always change behavior sufficiently. Some people will change their actions for altruistic reasons; others will require some incentive to do so. And, invariably, some people and businesses will require more than incentives and education to take responsible actions. The following actions will help ensure individual and collective responsibility for protecting water resources:

---

- **Education** — all levels of government, the media, trade, and professional societies and academic institutions can help to educate individuals and businesses about how their actions may degrade water resources and what actions can be taken to reduce or eliminate those impacts.
- **Incentives and financial assistance** — Often individuals and businesses want to make changes to protect water resources but lack the financial resources to do so.
- **Facilitation** — Government must make responsible behavior easier by, for example, working with the private sector to provide for collection, recycling, and proper disposal facilities for small quantities of hazardous waste.
- **Regulation** — Regulation of some activities is a necessary part of governmental efforts to protect water quality and aquatic resources.

#### A Watershed Basis for Watershed Planning and Management

Most natural events and economic activities affect the quality of water resources principally within watershed boundaries. As a result, watersheds constitute the most sensible hydrologic unit within which actions should be taken to restore and protect water quality. In fact, watersheds also may define the appropriate spatial boundaries for total environmental and economic planning.

This approach provides the framework to evaluate natural resource problems using a natural systems approach. Controls developed at the national and state level must be combined with individually developed strategies for unique river basins, watersheds, and collection basins or receiving waters. Implementation and funding of protection efforts within watersheds motivates individual action and provides the public reasonable assurance that those asked to pay for clean-up will also enjoy its benefits. Watershed-based management provides a far better opportunity to resolve intergovernmental or interjurisdictional conflicts, establish goals and priorities through collaboration and consensus, and manage for results. Moreover, watersheds allow for flexibility to address water quality/quantity problems and their interaction in different climatic settings.

Under EPA and state leadership, we can point to several useful examples of watershed *planning*, but more limited progress has been made in watershed *management*. Consequently, Water Quality 2000 recommends that:

- *Congress should create a new national program of watershed planning and management, including a mandate for implementation of activities as a condition of participating in planning.*
  - *Congress should impose no particular management form on the states and should build upon existing watershed mechanisms. However, planning and management institutions should be required for all 21 of the major riverine watersheds in the United States.*
  - *Congress should encourage, authorize, and approve the creation of interstate regional mechanisms, including joint federal-interstate compacts, as requested by states to plan and manage water resources. Where appropriate, watershed planning and management institutions should be nested, reflecting the multiple orders of progressively larger watersheds. Institutions created to manage smaller watersheds should participate in planning and management of the large watersheds to which they belong. Such a nested hierarchy could be organized at the top with an umbrella planning institution for each major riverine watershed. These institutions should include a mechanism to plan for protection of groundwater resources that cross watershed boundaries.*
  - *Many of the other recommendations contained in this report — including many of the pollution prevention recommendations — should be implemented as needed to support the goals of individual watershed plans. Other activities particularly well suited for implementation under a watershed framework include (1) land-use planning, (2) drinking water delivery, (3) operation of water resources structures, (4) range- and pastureland management, and (5) urban lands management.*
-

## Getting from Problems to Solutions — The Tools of Change

In our Interim Report, Water Quality 2000 identified several fundamental impediments to achieving the nation's clean water goals. At the conclusion of the report, these impediments were recast as specific challenges to ourselves and the broader community. These challenges provide a framework for organizing our 85 specific consensus recommendations.

Along with the three strategies for protection of surface and ground water resources suggested above, these recommendations comprise what we believe to be a representative and balanced call to action. But despite the broad scope of issues addressed, these recommendations are still not comprehensive. Some important issues were either beyond the scope of Water Quality 2000 or the expertise of the participants. These included international water quality and water management problems, the effect of climate change on water resources, the need for a U.S. population policy, and appropriate funding mechanisms for all Water Quality 2000 recommendations.

In addition, consensus was not achieved on every issue discussed. Issues where Water Quality 2000 participants were unable to agree included: appropriate standards for control of combined sewer overflows; the need for an outright ban on underground injection of hazardous substances; the appropriate approach to prevent groundwater contamination from surface impoundments not subject to current law; the need for comprehensive federal groundwater legislation and national groundwater cleanup standards; and the role of risk assessment in establishing water quality priorities. Other areas of disagreement are noted in the report. In general, differences involved specific actions needed to implement agreed-upon goals.

### *Securing Public Commitment Through Education and Training*

Environmental education for all ages can promote long-run societal changes that address the causes of pollution. Environmental education and training programs should be offered to a wide range of professionals, such as locally elected and appointed officials, legislators, industrial and utility managers, journalists, and teachers. Water resources professionals will require specialized training in natural resources fields, as will other natural resources managers.

Solutions lie in new programs of environmental education beginning in elementary school and continuing throughout all levels of education and professional training.

### *Preventing Pollution*

Pollution prevention is at the heart of Water Quality 2000's Vision Statement and Goals. Perhaps our greatest challenge lies in preventing pollution associated with runoff from rural and urban lands. Preventing pollution from agricultural practices may return the most dramatic improvements in water quality because of the vast land areas used for agricultural production and the historical absence of attention paid to this source.

Solutions lie in implementing pollution prevention programs across all media and providing incentives so that all sectors of society will adopt prevention practices as a way of life.

### *Promoting Wise Use of Resources*

Using resources wisely is conceptually analogous to preventing pollution. That is, rather than using water, energy, and natural and other resources wastefully and having to find more of them as a consequence, using resources wisely from the outset recognizes their value to society, reduces impairment of ecosystem functions and values, and builds individual responsibility for protecting water resources.

Like pollution prevention, the potential to use resources more wisely exists in all sectors. Consequently, long-run solutions ultimately lie in educating society — in changing the way society values water and natural resources. In the near-term, solutions lie in government programs, such as metering water use and others to improve the efficiency of water use, economic incentives to promote utility energy conservation, and programs to increase recycling of household waste and promote beneficial use of biosolids.

---

### ***Managing Growth and Development***

Inadequately controlled growth and development is the principal cause of water quality and water resource degradation in coastal zones and riparian habitats. Many activities associated with low-density development are potential sources of surface and ground water resource contamination.

Solutions lie in comprehensive, growth management aimed at reducing low-density sprawl, protecting aquatic resources from the effects of waterfront development, drawing attention to the connection between land use and the quality of groundwater, and other measures to protect aquatic resources from degradation associated with land development.

### ***Increasing Scientific Understanding and Improving Technologies***

Many current water quality problems can be solved with current technologies. In more limited instances, technological innovation is itself an impediment. Also, additional progress in water resource protection will occur only if we are prepared with a sound scientific understanding of the interconnectedness of institutions, ecology, and economics. While advancements in science and technology will have measurable near-term benefits, an even greater return from such advancements can be expected within, perhaps, the next 10 to 20 years.

Solutions lie in strengthening basic scientific activities, such as data collection and monitoring of the health of ecosystems, and in more applied endeavors, such as research and development in new pollution prevention technologies, methods to restore degraded habitat, or ways to evaluate the effectiveness of water conservation strategies.

### ***Eliminating, Resolving, and Filling Regulatory and Legislative Overlaps, Conflicts, and Gaps***

While a mix of voluntary and mandatory programs is appropriate, all of Water Quality 2000's Phase III Challenge Groups identified opportunities to improve our statutes and regulatory programs. Recommendations are presented in this section with the recognition that the list of improvements is incomplete. But because of the attention they received from hundreds of water professionals, our hope is that these recommendations address the most important overlaps, conflicts, and gaps.

Recommendations include broader protection of wetlands and public water supplies, development of water quality criteria for all pesticides, restructuring federal farm commodity programs to remove disincentives for stewardship, improved regulation of the bottled water industry, and development of national septic system standards.

### ***Strengthening Existing Federal Programs***

Many ongoing programs administered by the U.S. Environmental Protection Agency, U.S. Department of Agriculture, U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, Bureau of Reclamation, and others are working well or could be improved with relatively minor changes. Still others have the promise of accomplishing goals but face resource constraints or political resistance.

This section highlights the many examples of such programs and makes recommendations regarding the nature of improvements needed to strengthen and continue them. Not all programs are covered; the absence of a program does not necessarily mean that it is not working or should be discontinued.

Recommendations for strengthening existing federal programs include development of effluent guidelines and standards for new and previously identified industries, adequate funding for NPDES permit programs, pretreatment program improvements, state promulgation of water quality standards for toxic constituents, prevention of spills by waterborne transport, and steps to reduce deposition of atmospheric contaminants.

---

### **Providing Incentives and Funding for Water Quality Improvements**

The financing systems established for water programs must recognize that, in the end, we all contribute to water resource problems and we all must contribute to solve them. Although specific funding mechanisms were not addressed, Water Quality 2000 endorses a renewed federal commitment to financing water quality improvements, in part through general revenues. At the same time, by reducing costs through pollution prevention, individuals and private enterprise should gain some sense that remaining financing methods are relatively efficient and effective.

To the greatest extent possible, users of direct environmental services must be asked to pay the full cost of supplying the service (with safeguards to ensure lifeline services for those in need), in rough proportion to their individual levels of use; beneficiaries of investments in clean water must be asked to pay for such improvements in rough proportion to their receipt of benefits; and contributors to water quality impairment must be asked to pay for cleanup in rough proportion to the costs they impose on ecosystems.

### **A Management Approach for Solving Water Quality Problems**

Correcting the range of problems associated with U.S. water quality will require a long-term strategy that specifies what exactly is to be accomplished, who is responsible for assuring progress, and how incremental progress can be measured. It must recognize that all of society contributes to water quality impairment, that all of society benefits from improvements, and that all of society must contribute to solutions.

A sensible strategy will begin with several short-term actions—strengthening state and local infrastructure, consolidating overlapping authorities, and simplifying decision-making processes, for example. For the long term, however, solutions must engage all sectors of society. All levels of government, industry, professional organizations, the media, and individual citizens must all play a role.

### **Next Steps — Implementing a New National Water Resources Policy**

This report and the Interim Report that preceded it present a wide-ranging discussion of current problems, the causes of these problems, and steps that we must take as a nation to achieve Water Quality 2000's vision: society living in harmony with healthy natural systems.

Implementing this vision will in many instances require fundamental changes in our governmental institutions, manufacturing or farming practices, and individual life-styles. The Water Quality 2000 member organizations are ready to move forward with a broad agenda for change that includes actions related to education, training, legislation, and regulation, science and technology, financing and incentives, and basic societal change.

As we approach the 21st century, ensuring healthy ecosystems and an adequate and safe water supply will require a sustained, collaborative effort by all sectors of society. Each of the organizations ratifying this report is committed to working individually and collectively to meet this challenge. We are optimistic we will succeed and urge all who care about protecting water resources to join us in this effort.

This is a reprint of the Executive Summary of the Water Quality 2000 Phase III Report, *A National Water Agenda for the 21st Century*. The full 180-page report includes a list of organizations that have endorsed the report, along with the full text of two minority reports that were submitted.

Copies of *A National Water Agenda for the 21st Century* are available for purchase from Water Environment Federation, 601 Wythe Street, Alexandria, VA 22314-1994. The cost is \$25, plus postage and handling. Call 800-666-0206 and specify order number TT02.

The Water Quality 2000 Interim Report, *Challenges for the Future*, is also available. A discount is available when purchasing both reports or for large quantity orders.

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, APRIL 1, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to recess, at 9:35 p.m. in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. Good morning to everybody.

This morning the Subcommittee on Water Resources and Environment will meet to continue its hearings on issues concerning reauthorization of the Clean Water Act.

At yesterday's hearing we received testimony from representatives of State interests discussing issues important to the States. At today's hearing, we will be hearing from representatives of local governments on issues of concerns to those particular political entities.

One of the central themes of yesterday's hearings, and one which will be repeated today is the need to make wise use of our limited resources in addressing water pollution problems.

I know that all levels of government there are not infinite resources to devote to water pollution control, as we all know. At the same time, people want continued improvement to water quality. Therefore, we welcome the suggestions of witnesses, such as yesterday's and today's, on ways to achieve water quality improvements and not bankrupt State and local resources.

Before we begin with our first witness, I will yield to my very distinguished colleague, the ranking Republican member of the subcommittee, Mr. Boehlert of New York.

Mr. BOEHLERT. Thank you very much, Mr. Chairman.

Yesterday we heard some very enlightening testimony from the organizations involved in administering the State Revolving Funds. Throughout the day calls for greater flexibility and continued capitalization of the SRF program were repeated.

I stand convinced that the SRF approach is the most effective and efficient way to fund the construction of waste water treatment facilities. With small adjustments to the current SRF program—and the adjustment I have in mind at this stage is a principal subsidy program—and continued Federal funding, I believe this program will allow us to realize the lofty clean water goals we placed our sights on back in 1972. In fact, I am convinced that we must increase Federal funding of the SRF.

America's water infrastructure needs are enormous, but they must be met. Our Nation's rich endowment of pure water has been central to our success, and we must continue to protect and preserve this very valuable resource.

Today we will hear from those people on the front line in the battle to protect America's waters. Their thoughts and insights will be essential in the crafting of effective clean water legislation. I look forward to their testimony.

Mr. APPELLEGATE. Thank you, Mr. Boehlert.

We'll have two panels today, first of which we will begin with the National Association of Counties, Mr. Reed Madden, and if he will come to the table; and the National Conference of Mayors, Mr. Tom Barnes.

Mr. POSHARD. Mr. Chairman.

Mr. APPELLEGATE. Mr. Poshard.

Mr. POSHARD. May I ask unanimous consent to submit a statement for the record, please.

Mr. APPELLEGATE. Without objection.

Mr. POSHARD. Thank you, sir.

[Mr. Poshard's prepared statement follows:]

#### STATEMENT OF HON. GLENN POSHARD

Mr. Chairman and members of the subcommittee, I am pleased to be here this morning to hear testimony about the problems relating to rural water supplies and treatment facilities.

I represent a large rural area in central and southern Illinois that is largely a coal mining and farming community. I have been part of the Lower Mississippi Delta Caucus for the last 3 years and much of our work has focused on how to provide basic services to communities in our districts. Many of the counties in my district have experienced chronic, double-digit unemployment. Therefore, these counties and municipalities simply do not have the tax base nor the economic resources to construct wastewater facilities or to provide clean drinking water to the citizens.

Determining the appropriate funding mechanisms to help the poor, rural communities of our Nation is critical. I look forward to hearing from the panelists as to possible solutions.

Thank you, Mr. Chairman.

Mr. APPELLEGATE. Okay, gentlemen, we're certainly anxious to hear what you have to say addressing an extremely important issue, which is of necessity to you.

Mr. Madden.

#### TESTIMONY OF W. REED MADDEN, CHAIRMAN, NATIONAL ASSOCIATION OF COUNTIES ENVIRONMENT, ENERGY, AND LAND USE STEERING COMMITTEE AND HON. THOMAS V. BARNES, MAYOR, CITY OF GARY, IN, ON BEHALF OF THE U.S. CONFERENCE OF MAYORS

Mr. MADDEN. Thank you, Mr. Chairman and member of the committee. Thank you again for the opportunity to testify today on the reauthorization of the Clean Water Act.

I am W. Reed Madden, Chairman of the Board of County Commissioners of Greene County, Ohio, and Chairman of the Environment, Energy, and Land Use Steering Committee for the National Association of Counties, known as NACO.

With your permission, Mr. Chairman, I would like to offer my formal testimony for the record and summarize NACO's views.

Mr. APPELLEGATE. Without objection.

Mr. MADDEN. NACO believes that the protection of the environment is essential to our country's economic future. In most States, counties and cities are the primary service delivers of clean water and for that reason we are especially aware of the importance of these hearings as you begin the process of reauthorizing the Clean Water Act.

Let me say at the outset, that our Nation's counties fully support the goals of the Clean Water Act. We realize, however, that more than twenty years after the first passage of the Clean Water Act we still have not achieved the goal of fishable and swimmable waters throughout our Nation.

Mr. Chairman, perhaps it is time to re-examine the feasibility of reaching that goal. Given our limited resources, imperfect science, and the need to prioritize our most serious risks, we may have to accept the fact that every body of water cannot be made fishable and swimmable.

Local elected officials know that we must continue to invest in pollution prevention and remediation. But we also know that there is a point beyond which we can break the financial backs of our citizens. If the public becomes convinced that mandated programs that are supposed to be good for us are not worth the price, we lose that enormous well of good will that has sustained our environmental clean up programs since the 1970s.

The National Association of Counties' view is that priorities must be set. Congress simply cannot expect local governments to rely entirely on their own limited dollars to solve all of the environmental problems that face us. We think there must be some degree of balancing risk focusing on those areas which need attention the most, then working toward meeting other less critical environmental obligations.

Let me first bring up the State Revolving Loan Funds. Mr. Chairman, without the continuing involvement of the Federal Government in providing and expanding funding for construction of municipal waste water treatment facilities, it is clear that we will not accomplish the objectives of the Act.

While NACO recognizes the need to balance the Federal budget and reduce the deficit, we on the local level feel that we have done our fair share and then some. NACO calls upon Congress to maintain the SRF and to reauthorize the program at an amount no less than three billion dollars per year for its implementation. We also favor changes in the program that will allow the States' flexibility to meet the needs of smaller communities. Improvements in the administration of the SRF programs, as we suggest in our written comments, will increase the chances that smaller governments will be able to obtain a SRF loan and begin to provide some equity to the system.

There will always be some types of communities in which the SRF will simply not adequately to the task of addressing our serious water quality construction needs. NACO supports the concept of giving the States more flexibility to serve the needs of these communities and to consider a set-aside or separate program for special circumstances.

We also recognize that a dedicated source of Federal revenues is critical to water quality improvement. NACO will be examining a

number of proposals, and we will be happy to provide the committee with our position when it is finalized.

NACO supported the revision of the 1989 wetlands manual because we believe it would result in a less costly wetland enforcement policy. We still feel that changes are needed in the following areas:

Designating a lead agency; a definition of wetlands in unique settings, and a distinction between historical natural wetlands and artificially created wetlands.

Finally, Mr. Chairman and the committee, NACO agrees in concept that watershed-based management provides a number of benefits in developing a comprehensive approach to environmental protection. Our steering committee will be reviewing in some detail the various proposals being put forth and will ultimately develop our position. We would like to request the opportunity to submit our recommendations to you when they have been approved formally by the NACO board of directors.

We want to bring to your attention, however, two points that we hope that you will keep in mind in the discussion:

First is the issue of land control by local governments. While we agree that sometimes there must be restrictions on the use of private property for environmental protection, we want to be intimately involved in developing those restrictions because we will certainly be blamed for them.

Second, we are concerned that county boundary lines and elected county officials might be disregarded in organizing watershed decisionmaking agencies or committees. Local decisionmaking is the key stone of NACO's philosophy, and we hope that any specific proposals on watershed management will have a strong local government component.

Thank you, Mr. Chairman and the committee for the opportunity to address you this morning.

Mr. APPLGATE. Thank you.

Mr. Barnes.

Mayor BARNES. Thank you very much, Mr. Chairman.

Mr. Chairman and members of the subcommittee, I am Thomas Barnes, Mayor of the City of Gary, Indiana, here today on behalf of the U.S. Conference of Mayors.

I certainly want to thank you for this opportunity to present our views. I thank you also for the House passage of the president's economic stimulus package. Its funding of environmental initiatives will certainly help our cities.

The subcommittee faces some great challenges in reauthorization of the Clean Water Act, and we pledge to work closely with you at every step of the process. Let me just share some highlights or some key areas of concern that the Nation's Mayors have as you move ahead:

For cities, the Clean Water Act is expensive. We're doing all that we can with higher water and sewer rates, fees, State, and local contributions and the like. We badly need the Federal Government to step up to the plate and help us meet these costs.

We strongly support the President's proposal to continue the State Revolving Fund Program and urge its reauthorization at two billion per year or more. This certainly will not meet all of the

waste water treatment needs identified by EPA and others, but we must at least meet this base line if we are not to fall further behind in meeting these needs.

We hope you will also consider a partial return to direct grant funding. There has been some discussion of a national user fee for clean water purposes, perhaps levied on those most responsible for polluting our waters. While the U.S. Conference of Mayors has no specific policy on user fees for clean water purposes, if they are to be instituted the receipts should be deposited in a trust fund and made available directly, I repeat, directly to localities in the form of grants that they apply for at EPA.

When viewed broadly, the State Revolving Fund Program has accomplished its objectives. But it is still very difficult for individual localities to use it in a fast and flexible manner to meet clean water needs. Grants will help.

Mr. Chairman and members, I certainly must point out that I represent the view of Mayors across this Nation when we say that we do not come here simply with our hands out. At this very moment in my own city of Gary, despite the economic devastation that we've suffered over the last couple of decades, we've just passed a thirty million dollar bond issue to enable us to meet some of the critical needs we face in meeting Clean Water requirements.

In addition, of course, we've had a fifteen million dollar loan from the State Revolving Fund in order to provide sewers to one of the areas in our city that has not had sewers throughout its entire history.

As we move ahead, we need the help of this subcommittee to create a new ethic and approach in EPA built on a principle that there be no costly regulation unless absolutely necessary, and then that it be implemented at the minimum level necessary to achieve realistic standards. Above all, we oppose additional mandates without accompanying funding.

Perhaps if we could just keynote this point, we would simply say that the end purpose of EPA should be to get the crud out of the water, not to impose punitive sanctions which divert scarce local resources from meeting this basic goal.

With respect to the concept of Comprehensive Watershed Management, we strongly support the subcommittee's efforts to develop an overall approach to pollution prevention by focusing on a comprehensive watershed-based approach. Federal funding and standard setting for water quality improvements based on sound science can be combined with local and regional responsibility for developing and implementing watershed management strategies.

In addition to SRF funds, the reauthorizing process and subsequent appropriation should provide steady, adequate, and reliable funding support for local watershed management planning and implementation.

On the issue of Combined Sewer Overflows, we recognize that the CSO problem is difficult and cannot be solved without a significant commitment of Federal funding support to assist local communities in meeting the need for minimization and mitigation of CSO incidents.

The Conference of Mayors supports the ongoing efforts of many cities and many other groups represented at these hearings to de-

velop a consensus for CSO control and mitigation. Local flexibility in meeting these standards must be promoted and encouraged to facilitate the development of cost effective local approaches to overall CSO improvements.

Often when I speak of my own city of Gary, I know that in spite of the severe economic dislocation that I suggested earlier, we continue to be blessed with one of the world's great resources, Lake Michigan.

EPA is expected soon to publish lengthy and complex guidance for the Great Lakes Water Quality Initiative, to continue the significant and ongoing progress which has been made in improving and protecting water quality in the Great Lakes. We know that capital-intensive project requirements cannot, I repeat, cannot substitute for scientifically sound water quality criteria and a comprehensive approach to pollution control and mitigation.

We ask EPA to work with Mayors in the region and this subcommittee for a workable Great Lakes approach.

Finally, Mr. Chairman, too often cities and other local governments are seen by EPA as part of "the regulated community," and not as full professional participants in achieving the environmental progress we all seek to assure. I am hopeful that by developing and implementing such initiatives as the watershed management approach to water quality protection that we can put into practice the kind of partnership that is necessary to assure further progress.

Again, regulation should have one goal: get the crud out of the water. We all should share that goal. And while we're working in our case to improve EPA's record of working with Mayors, it is not, we recognize, at this point the best that it can be. It can be better.

In connection with this, I want to take this opportunity to ask this subcommittee to consider authorizing EPA to create models for "local environmental management action programs" to demonstrate ways in which EPA and cities can work together to solve problems. We need EPA's technical assistance, we need their expertise, and funding—not just the regulatory enforcement schemes they have focused on too often over the years. Please help us in that regard during this reauthorization process.

Mr. Chairman, in summary I would like to again thank you for efforts to date. We urge that a better funded and more flexible program be the hallmark of the Clean Water Act in the future. We must get a handle on the regulatory process to make it more sensible and the goals of the Act more achievable, and EPA must work better with cities in the period ahead.

I know that this subcommittee is committed to that goal, as is the President and the EPA Administrator, and we look forward to working with them and with you to achieve these goals.

Thank you very much for this opportunity, Mr. Chairman and members of this subcommittee.

Mr. APPLEGATE. Gentlemen, thank you very much for your testimony, and I think we're all very sensitive to the problems that are facing the smaller communities and for the need to meet the Federal mandates, not only in waste water treatment needs but so many other areas that the Federal Government has mandated upon smaller communities or any size community back home.

I have a question here that I guess is best addressed to Mr. Madden but either can answer.

I want to know for the certain smaller rural communities, do you think that either zero interest loans or principal subsidies can address the needs and—there may be an obvious answer to this—but are there certain communities which need grants for a hundred percent of the cost?

Mr. MADDEN. Well, Mr. Chairman, you are right when you answered the question yourself. The zero interest loans always sound better but we know in the real world that something has to be paid back to those sources once the State gets the money from the Federal government.

The grant issue, for instance, we have a small community in Greene County, Ohio, by the name of Clifton, and it borders both Greene County as well as Clark County and Springfield. The problem there is the village is built on solid rock, and there's only six to twelve inches of sandy loam and dirt on top of the rock. The sixty some residents of this area being in the lower income brackets, are unable to afford the sewer system that EPA has now put the findings and orders in effect for.

And the loans with interest rates—some at two percent, some at four—it's still a hardship because every property owner now is going to have to come up with at least two to four thousand dollars or a monthly expense of forty five to sixty five dollars.

Mr. APPLEGATE. What kind of a cost is that?

Mr. MADDEN. It's about—the whole project is about two and a half million dollars. And if this is just for sixty four residents, it's very, very expensive.

Now this is a vacuum system; it's not a conventional system. So here again the innovative systems work. It will not be built upon or added on for economic development purposes in this small community, but we need that grant or we need those low interest loans. And, of course, a zero interest loan would be most beneficial but a grant, which we did have before in our county as we were under findings and orders, could cut that monthly payment down to our citizens.

Mr. APPLEGATE. What about the principal subsidies approach?

Mr. MADDEN. Pardon?

Mr. APPLEGATE. Principal subsidies, that was brought up yesterday from Ms. Aggras from the State of New York in establishing a kind of technical assistance program—and I don't think she talked so much as construction grants but mostly in technical assistance and that type of thing—with the interest earned from monies that would be earned by the State Revolving Fund and they could be utilized back to small economically distressed communities.

You're not familiar with that?

Mayor BARNES. Would that be basically a system which acts as the principal as well. In other words in the form of a grant? Is that essentially what that—

Mr. BOEHLERT. Mr. Chairman, may I intervene here just a second?

Mr. APPLEGATE. Yes.

Mr. BOEHLERT. Just a point of clarification, the New York plan or the principal subsidy plan, does call for construction financing too.

Mr. APPELGATE. Oh, it does.

Mr. BOEHLERT. In essence, what it does is recognize that there are some communities so hard pressed that even a zero interest loan is not enough to make it go. The theory is that an outright grant is not the best utilization of the resources because everybody will stand in line for the grant and won't go for the other program.

So on an ability to pay, and there would be some objective way to analyze this, a community might have a no interest loan plus have some of its principal payment subsidized depending on the ability to pay. That's what it amounts to.

Mr. APPELGATE. Yes, that's what it is.

I didn't know that New York had the money in for construction grants, which would be all right. But, of course, they have the ability to generate more money through the interest.

How much of a State Revolving Fund does Indiana, Ohio have?

Mr. MADDEN. There's not too much left, and with the economic stimulus plan that I believe that's over in the Senate right now being debated, the non-entitlement part of the Community Development Block Grants can also aid in a grant to those communities that need the funding too. Now that could apply to the grant, but we at the local level need those CDBGs.

Mayor BARNES. If I might add, Mr. Chairman, as well on that same issue—I think we've just about drained the State's SRF funds with a bit more than fourteen million dollars that we finally obtained this year; we've been working on that for about three and a half years—but if we think about the importance of having either grant funds or zero interest loans—just think of this scenario for a second:

We start with an area that has been economically devastated such as Gary, Indiana, and certainly some other urban areas in the Nation, then we come this year with the State Board of Tax Commissioners after we've completed our budget who indicate that we have to cut five million dollars from a bare bones budget. And then we come into this year with a crisis in the city where we have an environmental fire that rages out of control and requires a tremendous amount of added resources that we have to deal with that are not budgeted in any way.

And also each day, each day, threatened with the potential of one of our garbage trucks going down an alley and perhaps causing a cave-in on sewers that are seventy or eighty years old, and so it makes it obvious that in this whole area here practically every cost that we run into are costs that are not budgeted. And, quite frankly, it's impossible for us to budget them because we simply do not have the dollars.

Mr. APPELGATE. I have just a little bit of information here that Ohio's revolving fund is somewhere in the neighborhood of about five hundred million dollars, and if that was loaned out at an interest rate of three percent, it could generate some fifteen million dollars that could be utilized towards principal subsidies—not a great deal of money. Some areas for large, large amounts, which would generate a lot.

The only concern that I have with just relying on something like that is the smaller—and I pointed out yesterday—like West Virginia who has maybe an inordinate share of needs for waste water treatment facilities and yet they don't have much money in their fund.

But that's what we understand Ohio's is, and it would help. There's probably no question about that. I don't know what it would do to the integrity of the loan over the long period. It would probably deplete, but at least it could extend it out and help.

Let me—Mr. Madden, you make a point that watershed planning involves land use decision, which you feel is best handled by local governments.

Mr. MADDEN. That's correct.

Mr. APPLGATE. Do you think that the primary responsibility should be at the local level or do you think that it should be a local-State program to address that? And then you're on the Indiana border, are you not?

Mr. MADDEN. Yes, I'm close to the Indiana border.

Mr. APPLGATE. And how would you address interstate watershed?

Mr. MADDEN. Well, here again, it's a problem but it could be solved by the locals getting together in that regional planning effort.

If the locals can form a district, if it would be of most benefit, that should be the local option. And if it does happen to cross over to that great State of Indiana, I'm sure that that district can work together with the soil and water conservation districts of both States and work together on their proper agreements.

But, again, let me emphasize I think the important part of this is that the local government makes the decision.

Mr. APPLGATE. Okay, and just one question primarily for Mr. Barnes, I guess, and it sort of addresses what Mr. Boehlert was referring to.

We both expressed the need for some kind of a grant assistance program to help small and poor communities to meet their needs, and some of the witnesses, however, suggested that if there were grants, it's likely that many communities wouldn't do anything except wait for the grant but that with limited resources, it might never happen. And, of course, they also discuss the possibility that there might be a tendency to gold plate the projects where there were grants rather than the repayment of the loans.

What do you think about that? How do you respond to that? What can we do to circumvent the—

Mayor BARNES. I think it's like anything else, Mr. Chairman, committee members.

Obviously, there's always the risk of some taking advantage of programs whether it be grants, whether it be loans, or otherwise. But I do think we have to recognize that our local communities, governmental communities, have truly kept the faith, quite frankly, during some very, very difficult times. And it seems to me, as I've indicated earlier, when we've come here, we've not simply suggested to provide us with dollars. We put our own dollars out there, and in most instances, quite frankly, we are the bigger partner in

bearing the burden outside, of course, of the initial construction, say, of our sanitary district treatment plant.

The bigger part of that burden on an ongoing basis has been the contribution by our local governments, and, quite frankly, we are getting smarter where we recognize that we have very little to work with and we're not really looking to the Federal Government to carry programs any longer. That's something we've just about given up on, but what we do look for is a Federal Government in a sense to pinch hit with us sometimes, more or less to just give us that little added degree of help that we need in order to make something work. And that's really I think all that we're asking for now. We're not asking for the big part of it. We're asking you to supplement us so that we can make these things really work.

Mr. APPEGATE. I think the point is that most people representing local governments have made, of course, is that there just isn't any way that they can do this by themselves. The enormity of the cost staggers the imagination. When you're talking about the situation with the small community in Greene County, for sixty some odd people, you're talking two and a half million dollars. It just staggers the mind.

Gary, Indiana is what, a hundred and forty, fifty thousand?

Mayor BARNES. About a hundred twenty thousand.

Mr. APPEGATE. A hundred and twenty thousand?

Mayor BARNES. That's correct.

Mr. APPEGATE. Well, I guess it was a hundred and fifty at one time.

Mayor BARNES. Well, at one time we were a hundred and eighty five thousand.

Mr. APPEGATE. A hundred and eighty five thousand?

Mayor BARNES. That's right, in the 1970s.

Mr. APPEGATE. Well, I know what that is because my town used to be once 140,000 in Steubenville and it's now 22,000. And we've lost a lot of our industries, and we're much like Gary because we have a lot of steel and we have a lot of unemployment. Had the people stayed around, the unemployment percentages would be staggering. But they've moved on and the unemployment figures are still staggering, and the inability of people on the local level to be able to pay these enormous costs is very difficult. And I'm sure that Gary, Indiana is no different and may be even—probably worse than what it is in my small community, and you probably have an aging community because your young people are moving.

Mayor BARNES. That's right, and that's one of the critical problems that we're facing. It's kind of like a catch-22. We want to keep our young people there, we need those brains, we need that talent, we need that energy. And, yet, at the same time, we're not able to offer them the kind of opportunities that we had when we were coming up in our communities.

Mr. APPEGATE. Yes, it's difficult to keep those young people around with the promises that something might get better, and that's where you're real earning power is going to be, and that's how we're going to build back up hopefully one day in Gary, and in Greene County, and in Jefferson County, and many of the other counties throughout the United States.

Well, I thank you for your testimony. Your statements will be made a part of the record, your full statements, and we perhaps will be submitting questions to you and hope that you would answer those as quickly as possible.

Mr. Boehlert.

Mr. BOEHLERT. Thank you, Mr. Chairman.

First of all, Mr. Mayor and Mr. County Commissioner, I want you to know that I'm one of you. I'm a former county executive, so I'm very much aware of the problems facing local governments. You get the mandates without the money, and I want to compliment both of your organizations, the Conference of Mayors and NACO, for being modest in your request here. The county executives are a little more ambitious. You're asking for three billion; the mayors, only two billion. We're going to have requests for a lot more.

I would urge both of you to think in terms of reporting back to your organizations about this principal subsidy approach. That's something that I find rather appealing at this stage, and I want to work with your respective organizations to sort of flesh it out to see if it will best serve your needs because the chairman and I both agree that there are communities out across America that have real difficulty coming up with any repayment program. So we'll work with NACO and the Conference of Mayors.

The other thing I want to say is, where were you when I needed you last year? Last year I tried very hard to convince the Congress that we should re-institute general revenue sharing. Mr. Mayor and Mr. County Commissioner, you would have enjoyed that immensely if you had of, and both of your organizations were disappointing in that regard, so report that back too because they both had visions of sugar plums and wanted a greatly expanded program costing three times what we ever had spent before in the history of this body on general revenue sharing.

I just want to modestly—maybe that's my Republicanism showing—re-institute the program at the level it was when it was cast aside.

Having said all of the above, now let me get to you, Mr. Madden, if I may. You know, one of the problems identified with this whole issue is the need for adequate planning and design and construction expertise, and often times at the small local government level you don't have that expertise.

Where is it best addressed? Is it at the county level or should you go to the State level, or should the Federal level be involved in it?

Mr. MADDEN. No, it should be the county level. We in county governments across our country have the expertise as far as supervision in the engineering or the ability to get contracts, to get consultation, and I think it's we at the county level.

Mr. BOEHLERT. How big is your county?

Mr. MADDEN. Our county is 140,000 in population.

Mr. BOEHLERT. And you have a single county planning department?

Mr. MADDEN. We have a regional planning within that county and then we're a part of the Dayton, Ohio effort of Miami Valley regional planning.

Mr. BOEHLERT. Well, because a county of 140,000 really couldn't afford on its own to have a comprehensive planning operation.

Mr. MADDEN. Well, we do quite well.

Mr. BOEHLERT. But, no, really it's just exclusively for the county without a multi-county effort?

Mr. MADDEN. Well, we do our regional planning right within the county as well as most of other counties in southwest Ohio do.

Mr. BOEHLERT. Well, who came up with that figure for two and a half million dollars for that community—

Mr. MADDEN. Well, let me—

Mr. BOEHLERT. According to my math—

Mr. MADDEN. It's easy—I was adding on two other things because of the Little Miami River going through the area with—sooner or later, we're going to have to put water in there also because they're on private wells. The figure right now for the sewer system is \$300,000. And then the total clean up of the Little Miami River with public water, public sewer—and we don't know how we're going to do a water treatment plant into the area—but with the whole Little Miami River well above two and a half million dollars.

But the sewer system that's been under the findings and orders right now is two hundred and fifty to three hundred thousand dollars.

Mr. BOEHLERT. Okay, because that's a big difference. When you said two and a half million, I almost went through the ceiling.

Mr. MADDEN. Well, it's easy when you get to Washington here for a little kid from Greene County, we just—you know, we get the decimal in the wrong place.

Mr. BOEHLERT. Well, I guess we should just turn off the lights and turn the key in the door and give everybody forty thousand dollars instead of doing it—you know.

Mr. MADDEN. Well, you know, somebody said it be easier just to move the city, but the village has been there for two hundred years.

Mr. BOEHLERT. Here's the point I'm getting at:

I am concerned as a former country executive, and I know the plight you face, I'm concerned that a lot of small communities in desperation don't have the expertise they need; they reach out for some expert and the expert is anyone who lives fifty miles away or farther, and that expert comes in and says to a community that we've got this plan for you and here's what you've got to do to solve the problem. It's going to cost you two and a half million dollars.

I mean, it's not so far-fetched to think that that might happen for a community of sixty four. That comes out to \$40,000 per person. I mean, you just close the town and walk away on a deal like that.

Where do we get the expert planning? I mean, you have to be hard pressed at the local level. I don't know how a county of 140,000 can maintain that expertise. I really don't.

Mr. MADDEN. Well, basically, some of that expertise has come from community development block grants through the health department to get their expertise. And then, of course, EPA was notified and the findings and orders come down.

And, Mr. Chairman, you addressed that what happens that we should wait for these grant programs. Well, there's no waiting when you're under findings and orders. In local government, there's no waiting when that phone call comes in that I don't have water

to shower and to bathe or to drink, or the septic systems are failing and it's neighbor against neighbor because of the stench.

Mr. BOEHLERT. Mr. Mayor, what do you do in Gary? You have your own planning department within the city?

Mayor BARNES. We have our own planning department, but in addition, of course, there's a regional planning department. Two of the counties combined under the Northern Indiana Regional Planning Commission.

Mr. BOEHLERT. So are you with the—Gary, obviously, is within a county?

Mayor BARNES. That's correct.

Mr. BOEHLERT. Now you have the Gary City Planning Department and then the county would have a planning operation that's part of that regional effort?

Mayor BARNES. Yes, that's correct. And they are two separate, planning departments. But, in addition for many of the major developments there's a regional planning department that combines two counties. Lake County, with Gary as the largest city, has approximately 480,000 people.

But just to mention just a little bit further, on the issue of how we plan or where we get the resources, it is important for at least a couple of reasons that they really be looked at in many of these areas in a partnership fashion because many of the problems—if you think about just the issue we've talked about, the watershed issue—this is something that in my own city and in others is affected by jurisdictions not only intracounty or intrastate, but also intercounty and interstate. And so, consequently, it's important for us to recognize that those that are being affected in any way, and certainly if they're going to be required to come up with some resources, they're going to want to have some input in terms of the planning and showing that the impact on them is going to be one that is equitable.

Mr. BOEHLERT. Thank you both very much. You both have difficult jobs in government. You're right on the firing line, and I just want you to know that we want to be helpful.

Thank you.

Mr. MADDEN. Thank you.

Mayor BARNES. Thank you.

Mr. APPLGATE. Thank you, Mr. Boehlert.

Mr. Poshard.

Mr. POSHARD. Thank you, Mr. Chairman.

Mr. Madden, I noted that in your testimony, you discussed a problem that's unique to the rural areas with regard to the use of the SRF money, and that is purchasing land and right of way for the sewers or water lines that need to be laid. That's a critical problem for rural counties. It is where I live.

Should we loosen up those guidelines, cut out some of those restrictions and allow some of those rural areas to use those monies for that purpose?

Mr. MADDEN. I would think so. I'd be in full support of that.

Mr. POSHARD. Have you found it to be a problem where you live?

Mr. MADDEN. Well, it's not—basically the right of way purchase has been going along. We have two or three areas of findings and orders within our county right now; one an area of 700 residents

that were under findings and orders to put a sewer system in. We're just to the right of way part of that program. With construction, we hope to begin next year.

We do need some help, and we don't need any more restrictions. With wetlands, with other things that are involved, and to protect our area, which is the number one product of the industry's agriculture.

Mr. POSHARD. I know in some instances where I live, the purchase of the land and the right of way is more expensive than the construction itself because it is an agriculture area. That poses a great problem when they can't use those monies for that purpose.

Mr. MADDEN. Well, one of the things that we've been using in our county is the Rails to Trails Program in any right of ways. We've been trying to get these things purchased up with the Intermodal Surface Transportation Efficiency Act. We've been available to get funds to try to look ahead for these problems that are sure to come because basically, as one person said in Ohio, there's no private well that is a hundred percent safe. And that's scary when we come to the State of Ohio when we think of—and our source of water for drinking is underground. There's no natural lakes in the State of Ohio, minus Lake Erie, which we share.

Mr. POSHARD. I see.

Mr. Mayor, I noted that you referred to the possibility of a user fee on polluters and that probably ought to go into a trust fund from which people who needed that money could use it for specific purposes.

Have the mayors endorsed that as a policy?

Mayor BARNES. That has not been endorsed as a policy. It's certainly something that has been recognized as a potential option, but it is not one that the Mayors have endorsed as a policy.

But, as you indicated, the key thing is this:

If in fact this committee is going to recommend such a fee or if this is an area that is going to be looked at seriously, then it must be one that ensures that those dollars are going to be dedicated to a trust fund so that they can in fact assist us, where the rubber indeed meets the road, in terms of dealing with some of these problems of improving the water quality.

Mr. POSHARD. So that you have some accountability in tracking that money and getting back to the purpose for which it is designed.

Mayor BARNES. Absolutely, that's essential.

Mr. POSHARD. Well, let me ask you this, and it's been touched upon by the previous speakers. Maybe both of you would want to comment.

I represent a large rural area, twenty seven counties in my district, and the truth is—whether we want to admit it or not—every time we attempt to economize or to become more cost-effective and efficient in our operation through a regional cooperative effort—be it in health care provision, or law enforcement, or whatever it is—the counties and the local governments get parochial as heck. They do; I mean, these people are very independent, everything stops at the county line, you're not going to take an ambulance over the border, you're not going to run my sheriff to the next county to de-

liver a person at some regional jail even though it might save the taxpayers five millions bucks.

I mean, what are your organizations doing to help us break down this territorialism and this very parochial attitude that really cost the taxpayers of this country billions of dollars and less efficiency at all levels of government. And there are imaginary political boundaries which divide us for no other reason than protection of turf.

What can we do about that?

Mayor BARNES. I don't know why you're locking at me. [Laughter.]

Mr. MADDEN. It's simple. All you do is look at the problem, get the committees in line. Somebody has to be the lead agent, somebody has to take charge in that region, and the situation that we did between Greene County and Clark County—not because the larger numbers of residents were on the Greene County side, because water flows from Clark to Greene, we just sat down and said, okay, somebody has got to be the lead agent. And it was us, and we decided it out, and then we kept them informed.

We've done this with economic development in our area—between Montgomery County and Dayton, Ohio with road construction. Somebody has to be the lead agent, and you've got to start solving these problems on a regional area.

We're doing it in the Miami Valley area of Ohio.

Mr. POSHARD. Well, then you're to be commended. I don't know that that's the rule throughout the country, however.

Mr. Mayor, you started to say something.

Mayor BARNES. Yes, I think we have to recognize, first of all, that it's going to take maybe a generation beyond the one that we're operating in where we get rid of all the parochial considerations. But I do think we need to look at those instances where we have had intercommunity cooperation.

There are some difficulties. I can assure you of that. The reason I thought about it when you raised that issue, I wondered whether you were reading my mind because we are grappling with some of those issues in our community right now. I can point to some areas where it's almost like pulling good teeth. I can also point to some real successes that we have had, such as the Lake Michigan Marine Development Commission, which is a combination of some six cities that are right along Lake Michigan where we have been able to do things even where limited dollars—where one community said, okay, you have progressed to a certain point on your marina development; we'll lend you some dollars in order to help you and you help us, you know, when we get at that point.

So there are some successes we can point to, and perhaps we need to just look at it and say what are those ingredients that lead toward success. But above all, it has to be something where the communities can sit down—or the communities of interest can sit down—take a look and determine are there is some common interest that are more important than our parochial interests. And in most instances, I think you'll find them.

But you're absolutely correct. It is a very difficult problem.

Mr. POSHARD. But local leadership is the key, not Federal to beat us over the head—

Mr. MADDEN. That's right.

Mayor BARNES. Absolutely.

Mr. MADDEN. Everybody wants clean air, everybody wants clean water, and both air and water know no boundaries.

Mr. POSHARD. Sir, thank you very much.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you, Mr. Poshard.

Mr. Hoekstra.

Mr. HOEKSTRA. Thank you.

I found some of the testimony fairly interesting.

Mr. Madden, could you elaborate a little bit more in terms of rethinking the goals, as you identified or as they're identified, of fishable and swimmable waters. I'd like to know why you said that maybe the goal should be rethought.

Could you identify perhaps some alternative objectives?

Mr. MADDEN. Well, there's some areas in the local government that—for instance, the exhaust areas of the placing back into the waters from waste water treatment plant, the temperature areas, and stuff like this, with the rules and regulations that are in effect, some of those areas might not be fishable or swimmable. There are some shipping lanes that connect large cities across our country, canal areas, and river way areas that probably—there's no amount of money that can be available to get it back to the pristine situation that it once was. Maybe those areas should be monitored, but at the same time, they are probably irreparable and maybe can be sealed and corralled to an extent that it won't damage any of the waters of any other area.

Mr. HOEKSTRA. Building on that, you also talk about the potential loss of the public good will and public support for the objectives of the bill.

Do you have any personal experiences where mandates have come down to the local level and where you take a look at the mandates? Have people at the local level said, where did these come from and these just don't really compute so that we are in fact losing that goodwill?

Mr. MADDEN. Well, I think one of the problems that we had in our area, we were under findings and orders back in 1986 to provide sewer for a moderate income group area of about 3,200 users, and we did at that time get a small grant that was still available. It helped in the process of approximately \$4.2 million, and we began construction.

Then EPA told us to stop because of ground water pollution from a manufacturing plant, which is a very large employer in our county, and we're still under litigation with this.

But the additional amount of money to put a sixty-inch sewer in this area has resulted from \$700,000 as planned through this one area, has gone as high now as \$5.6 million, which is double what the original project was.

So the mandate to do something, we obliged and completed that mandate but the goodwill now is being disturbed because of the industry and the polluter must pay. If the polluter must pay, we're going to lose a very large employer.

Mr. HOEKSTRA. Thank you. That's all the questions I have.

Mr. APPLGATE. Thank you, Mr. Hoekstra.

Mr. Nadler.

Mr. NADLER. Thank you, Mr. Chairman.

Mayor Barnes, you say that Federal funding and standard setting for water quality improvements based on sound science can be combined with local and regional responsibility for developing and implementing watershed management strategies appropriate to local conditions and letting the local people develop the programs to do this.

Am I correct in assuming that what you're really saying is that the Federal Government should set a standard and allow wide discretion to local authorities to propose or to come up with the strategies for meeting that standard?

Mayor BARNES. I think it's essential that the Federal government be a very active and perhaps even a lead partner in terms of setting the standards. But it has to be in collaboration with these communities where the problems are and, quite frankly, are in a better position in terms of implementing whatever determinations are being made. They should be a part, in other words, but again it shouldn't be with the notion of laying down a rule that has no sensitivity to what some of the problems that are in these communities.

Mr. NADLER. Let me ask you the following:

In New York we've had a situation with the Clean Air Act, where New York has been out of compliance for over twenty years. State and local government have, in my judgment at least, made no good faith efforts to achieve air quality standards. They've missed deadline after deadline for submitting State Implementation Plans. When the State Implementation Plans have finally been submitted, the State and local governments have made no effort to do what they said they were going to do, and every time you're talking about sanctions, the sanctions are so horrible that the Federal Government always shrinks from imposing them. We're about to see that again in New York.

What should the Federal Government do? If the Federal Government is going to simply work with States and cities in setting reasonable standards and let the local governments come up with strategies for meeting those standards, where they don't meet those standards, where they don't achieve what they promised they're going to achieve, where they don't make a real effort to implement what they say they're going to implement, what should the Federal Government do to enforce the standards?

Mayor BARNES. I think—and, of course, my community like many are facing sanctions of one type or another dealing with various environmental issues—but I think it's extremely important, and I said this when I sat in a chamber with EPA, with the U.S. Attorney, and with the judge just two years ago, when I had come into office and a consent decree had been signed by my predecessor that, quite frankly we were in a position where it was not one that we could live with. And it was very obvious at that particular time that the total posture of EPA had really gotten away from the notion of getting the water clean; that totally had been eliminated.

And so I simply suggested to the court at that time, I said the same thing I mentioned here: we recognize that if you are not meeting the obligations that you've agreed to that are in the law,

then someone is going to have to pay for that. And if you're the one who is at the bottom line of that, then you are the one who should pay.

But above all, it shouldn't take on the notion of being punitive, for punishment's sake alone. It should be geared toward getting the water clean, and as long as we keep that focus and our objective for the existence of EPA or any other regulatory agency, this is why we're in existence. We're not in existence to collect dollars in fines or to put onerous demands on communities. We're there in order to make sure the water gets clean in this instance. And if that's not being met and we set time limitations on it, then certainly while reasonable people still can disagree, at some point the buck has to stop and someone has to pay. And we're prepared for that.

Mr. NADLER. But my question is—again, I'm speaking from local experience as a State government official until very recently. The experience in New York has been that nothing happens, that State and local governments miss every deadline, never attain it, and the Federal Government shrinks back from imposing standards because the standards—from imposing sanctions because the sanctions are too punitive and would just reek havoc on the local economy and granted someone has to pay.

My question is could you suggest any way in which you could have some realistic enforcement strategy in the bill?

Mayor BARNES. Well, I'm not sure what some of those options might be, but again I might reiterate that we've not been as fortunate in my community because we are paying right now. We are paying—and, of course, we also are moving realistic toward meeting some goals as in the example that I alluded to earlier—where we have in our city one of the largest areas in the entire State population-wise, where individuals have never had sanitary sewers, have never been hooked up for treatment. And, yet, this demand that you must do something about it, or there's a sewage that's overflowing and what have you, and what are you doing about it, City of Gary, well, finally what we've had to do after trying to get the dollars from everywhere, we finally were able under the State Revolving Fund loan to get \$14 million after three and a half years, to get those dollars from the State.

Now, obviously, those are dollars that we pay back. I've never felt really that that should have been entirely a responsibility of the city, but we've reached out to meet a need of our people because that need was not being met by anyone else. But I fully agree with you that there are some instances where, you know, you have to set the limit, and obviously you have to pay if you don't meet it.

Mr. NADLER. Thank you.

Mr. APPLGATE. Mr. Horn.

Mr. HORN. Thank you, Mr. Chairman.

Mayor Barnes, Commissioner Madden, I've enjoyed your testimony. Success stories have been mentioned. You cited one, Mayor Barnes, in your own area.

What I'm interested in is from a national perspective since you have an opportunity periodically to chat with your colleagues who are city executives, county executives, around the country, which

State do you feel—either in the wetlands area, sewers area—has the best State-county-city relationship in addressing these problems? Are there two or three we can put at the top of the list?

Mayor BARNES. I'm not sure that I can say from my own experience any particular area that we've had greater success, you know, in terms of interrelationship.

Certainly, there have been in all of those areas—we've had to communicate with and ask the support of our county planning agency or the regional planning agency, and there's been a very cooperative approach in terms of providing information or providing technical assistance.

I think the areas where we really begin to get into problems sometimes and this whole issue of parochialism comes in is when you wind up having some resources in the pot and then you have these issues of who's going to control it; you know, the realistic political kinds of problems that we do face.

But where in those instances we've sat down and said, okay, let's take a look at it now; Gary has some interest that it wants to protect, and Hammond or the other communities have some interest they want to protect, now here's a common interest that all of us can agree on and so let's pursue it.

So I think that in any of these areas they offer opportunities for collaboration and for partnership and for supportive relationships, but I think they have to be looked at individually, quite frankly, and I don't know of any one that offers any greater opportunity.

Mr. HORN. Okay, Commissioner Madden.

Mr. MADDEN. Well, you know I'm going to say with the chairman up here that the great State of Ohio is a leader in communication on some of these items. But I think the States of Washington, Wisconsin, Minnesota, and Florida have addressed these concerns especially with their lakes, and rivers, and streams, and wetlands issues. Those are the leading States I would put there as models.

Mr. HORN. Now the reason for their success is what, gubernatorial leadership, cooperation at all levels that sort of exist in other areas? What's the model of that?

Mr. MADDEN. Well, I think one of the main models, especially for the State of Florida, would be because of the development of the mass population growth and the need to provide for the public drinking water, safe drinking water, as well as the sanitary sewer systems of that State.

Most of it is local government and the economic development that drives those areas of population. And the States of Wisconsin and Minnesota, they've always been leaders in the environmental issues of our country.

Mr. HORN. Thank you very much.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you.

Ms. Molinari.

Ms. MOLINARI. No questions, Mr. Chairman.

Mr. APPLGATE. Just trying to find some more questions for you, that's all. I'm sure you'll be glad to know that Mr. Filner came in. [Laughter.]

Mr. APPLGATE. Mr. Filner, do you have any questions for these gentlemen without knowing what they said? [Laughter.]

Mr. FILNER. I'll pass, Mr. Chairman. Thank you. [Laughter.]

Mr. APPELGATE. Okay.

Well, I thank you very, very much for some very, very expert testimony. You've livened this thing up, you've given us the perspective of your communities, and it will certainly help us in our deliberations. And I thank you very much for being here before the committee.

Mr. MADDEN. Thank you.

Mayor BARNES. Thank you very much.

Mr. APPELGATE. The next panel that we have will be the last panel, but it's a large panel.

We have Ken Kirk with the Association of Metropolitan Sewerage Agencies—you can all come up to the table;

Adrian Freund, American Planning Association;

Anne Dunihue, California Association of Sanitation Agencies;

Scott Tucker, National Association of Flood and Stormwater Management Agencies, and;

Doug Harrison, California Stormwater Quality Task Force.

Ladies and gentlemen, thank you very much for coming before the committee and giving us your perspective on the needs and the testimony from those that you represent.

I believe that we'll—I have first in my folder here Mr. Kirk.

**TESTIMONY OF KENNETH KIRK, EXECUTIVE DIRECTOR, ASSOCIATION OF METROPOLITAN SEWERAGE AGENCIES; ADRIAN P. FREUND, DIRECTOR, DEPARTMENT OF PLANNING & ENVIRONMENTAL MANAGEMENT, LOUISVILLE-JEFFERSON COUNTY, KY, ON BEHALF OF AMERICAN PLANNING ASSOCIATION; ANNE W. DUNIHUE, DIRECTOR, CHINO BASIN MUNICIPAL WATER DISTRICT, ON BEHALF OF CALIFORNIA ASSOCIATION OF SANITATION AGENCIES; SCOTT TUCKER, EXECUTIVE DIRECTOR, URBAN DRAINAGE AND FLOOD CONTROL DISTRICT, DENVER, COLORADO, ON BEHALF OF NATIONAL ASSOCIATION OF FLOOD AND STORMWATER MANAGEMENT AGENCIES; AND DOUG HARRISON, GENERAL MANAGER, FRESNO METROPOLITAN FLOOD CONTROL DISTRICT, ON BEHALF OF CALIFORNIA STORMWATER QUALITY TASK FORCE**

Mr. KIRK. Thank you, Mr. Chairman.

Mr. Chairman and members of the subcommittee, my name is Ken Kirk and I'm the Executive Director of the Association of Metropolitan Sewerage Agencies. I am pleased to be here today to share with you AMSA's perspective on the reauthorization of the Clean Water Act.

I truly regret that our president, Wayne Sylvester, from Orange County, California is unable to be here today as we had planned because it is more important for you to hear from the environmental practitioners in the field than from association staff here in Washington.

First, I'd like to provide a few comments to serve as the basis of our testimony.

AMSA supports the reauthorization of the Clean Water Act and its goal of fishable and swimmable waters. AMSA believes that this reauthorization must use an integrated and comprehensive strat-

egy that establishes new priorities for achieving water quality goals. It must recognize the wide range of conditions present in the Nation's watersheds and provide flexibility to decision makers so that they can address site-specific solutions; it must target point and non-point sources; it must develop mechanisms for control that properly balance environmental gains and their cost-effectiveness; and, it must provide the funding to implement its clean water mandates.

It is important to put the reauthorization of the Clean Water Act into historical perspective. This Nation, its states, cities, and towns, has made enormous progress in the more than twenty years since the passage of the 1972 Clean Water Act. In 1972, national standards that targeted point sources made sense. We had identifiable problems traceable to easily controlled sources. Congress provided funding, necessary deadlines, and enforcement mechanisms. Coupled with a considerable amount of public support and motivation, this set the stage for our Nation to successfully address many of its clean water challenges.

Today we face a totally different situation. While public support for environmental progress and improvement continues, the new and emerging issues we must address are more complex and costly, and fiscal shortfalls at every level of government are unprecedented, which makes dollars harder to get.

In a reauthorized Clean Water Act, we need to reconcile the constraints of the 1990s with our continued high expectations and the need to make continuing progress. This will involve several things, the first of which is an increased Federal financial commitment in partnership with states and local governments.

Attached to my testimony is a report AMSA has published called "The Cost of Clean." Among the key findings of the report are the following:

First, funds totalling over \$23 billion will be required for AMSA member agencies, and I underscore just AMSA member agencies and not all the other communities throughout the country, to meet currently mandated clean water needs to the year 1995. These needs relate to secondary treatment, advanced treatment, collection system projects including stormwater and combined sewer overflow control, and the repair and rehabilitation of facilities, many of which were built in the early years of the clean water program.

Second, and I refer you to the chart at my right, operation and maintenance costs traditionally make up a higher percentage of a local agency's budget than capital costs. As new technologies are applied to meet more stringent requirements, the costs associated with operation and maintenance increase. Based upon past surveys, we can project that O&M expenses will double every eight years with increases between nine percent and eleven percent per year. These costs are paid for totally by local communities.

Third, and again I refer you to the next chart, annual household user fees are now doubling every six years. They are projected to rise at an even greater rate in the future due to increased local funding of capital projects, increased operation and maintenance costs associated with higher levels of treatment, and newly mandated environmental programs.

The issue of increasing user fees heightens political pressures as rate increases impact users, especially those on fixed and limited incomes.

A lot of attention has been focused on the rate situation in Boston, but I can assure you that there are many other communities both large and small that are moving very rapidly in the same direction.

Finally, and I refer you to our last chart, of the noted \$23 billion in AMSA member needs, only eight percent is expected to be financed by Federal assistance. Currently, local governments, through rates and taxes, cover eighty percent or more of the capital burden in addition to one hundred percent of the sharply increasing operation maintenance and replacement costs.

The eleven percent projected State funding includes state revolving loans, which are ultimately repaid with local funds; thus increasing the real burden to local governments to more than ninety percent of the total wastewater capital costs.

This is in sharp contrast to the early days of the program when the combined Federal-State contribution was in the area of ninety percent and the local contribution was about ten.

I believe that we, my colleagues on this panel and the members of this distinguished subcommittee, should work together to keep the Federal feet to the fire. We must not lose sight of the fact that the clean water program is a national program with an integral relationship toward long-term environmental health and economic growth.

Our job and the collective mission and body of the national clean water program is far from done. To meet our future challenges, AMSA believes that an annual funding level of \$6 billion is warranted and that this money should be disbursed as both loans and grants.

As Jim Howard, the former chairman of this distinguished committee used to say, "This is one program you could throw money at and get results."

Mr. Chairman and members of the subcommittee, the grants program worked and much of the progress we now point to over the past twenty years is directly attributable to its earlier existence.

In 1987 we transitioned from grants to loans as a means to limit and eventually terminate the Federal financial commitment to the clean water program—not because the grants program didn't work. As you now begin the clean water reauthorization process, we encourage you to re-evaluate whether existing financial delivery systems are sufficient to meet the current and emerging needs of the Nation and our cities.

As I said earlier, we believe that both loans and grants are necessary to make continued clean water progress, and point to several States including Washington and Connecticut that are already successfully employing both loans and grants to assist their communities in meeting Federal clean water mandates.

The next step in reconciling constraints with expectations is for all of us to refocus our concerns and priorities. We need to resist the temptation to set unrealistic deadlines and prescriptive national solutions to local problems. We also need to resist the temptation to fix programs that aren't broken.

It's a tall task and we're very aware that many come before you with problems and complaints but no solutions. But along with our request and recommendations, we are also prepared to offer a solution.

With our testimony, we have provided you with a copy of proposed legislation that we have drafted titled "The Comprehensive Watershed Management Act Of 1993." The vision contained in The Comprehensive Watershed Management Act Of 1993 calls for the development of comprehensive watershed management plans with the participation of all point sources, non-point sources, users of the watershed, citizens, and levels of government.

Through the proposed legislation, the reduction of pollutant loadings follow rationally from a scientific analysis and site specific conditions and the technologies available to improve those conditions. Priorities are established based on the quality and use of receiving waters, ecosystem health, and the sources of pollutants that legitimately threaten the watershed.

AMSA believes that comprehensive watershed management planning must emphasize establishing priorities, maintaining flexibility, and empowering local, regional, and State government and the affected community at large to solve their unique problems.

Our bill does not, and I underscore not, focus exclusively on non-point sources, and there's absolutely no suggestion in our bill that point sources will abandon their ongoing efforts and commitment to the clean water program. What it does represent is a step forward in how we address future challenges. It acknowledges that the real sources of pollution today are broader, more diffuse, and costly than in the past; it underscores the need to take a rational and measured approach to address funding constraints at all levels of government; and it recognizes the importance of stakeholders' support and buy-in to make continued progress.

I've shared with you AMSA's views today, and we look forward to working with you, Mr. Chairman, and the members of the subcommittee as the Clean Water Act reauthorization process proceeds.

This concludes my testimony, and I would be pleased to answer any questions you may have.

Mr. APPLIGATE. Thank you, Mr. Kirk.

Mr. Freund.

Mr. FREUND. Chairman Applegate and distinguished members of the subcommittee, I am Adrian Freund, Director of the Louisville-Jefferson County Department of Planning and Environmental Management in Louisville, Kentucky.

Prior to assuming my present position in July 1992, I served for three years as chief of the Connecticut Department of Environmental Protection Water Management Bureau. I have twenty-one years of experience in urban and environmental planning, and I'm also a director of the American Planning Association.

On behalf of the American Planning Association, I am here today to present the Association's views on reauthorization of the Clean Water Act. The Association and its twenty eight thousand members have a great interest in the wise protection of our Nation's water resources. Our testimony is based in part on our adopted policy on

environmental protection, which is adopted by delegates from all forty five of our chapters.

APA's policy on environmental quality seeks to achieve the conservation of non-renewable resources, the integration of environmental protection programs into comprehensive and functional planning programs and special protection for environmentally sensitive areas.

Specifically, in relationship to water, we have adopted policies which include the following provisions:

First, areawide planning and implementation of water quality management and water supply are critical.

Second, Federal funding for the construction and upgrading of publicly owned waste water treatment plants must be continued. We believe that investment in publicly owned plants often supports new growth and development and their construction provides jobs. Unlike scattered private wastewater facilities, public facilities often reinforce centralized growth and infill and prevent urban sprawl and water quality degradation.

Third we believe that data collection and analysis of existing conditions should be supported by Federal funds. Local funding of monitoring programs often fails due to competition for scarce resources.

Fourth, we believe that Federal funds should be available to small and financially strapped communities to avoid geographic inequities and to prevent economic hardship. Areas of the Nation with exceptionally sensitive bodies of water, large concentrations of waste producing industries, or large low-income populations should not suffer diminished environmental quality because of an inability to pay.

Fifth, we believe that research on the effects and magnitude of non-point source pollution must continue and that the 319 program should shift from its current focus to implementation and not just demonstration.

Two years ago our association came before you subcommittee to present a planning perspective on the Clean Water Act reauthorization. At that time, we stressed four basic premises that underlie our positions on the Clean Water Act:

First was that water quality is fundamentally related to land use and land management. The business of planners and planning is to apply foresight to the way land is used and managed. Increasingly, environmental protection is an integral part of the process of developing comprehensive plans at all levels of government. Our communities' use of land directly impacts water quality. Land use planning is undertaken, as you know, by nearly all units of government, and increasingly we are looking to infrastructure investments in waste water facilities and other capital projects as a tool to help shape and guide urban growth and reduce the negative impacts of urbanization on water quality.

Second, we testified at that time that efforts to clean up polluted water requires extensive capital investments. We believe that long range capital planning of five to six years is needed at every level of government. Stable funding of infrastructure programs at the Federal level is essential to secure large and stable capital commitments from State and local government.

Third, we have an adopted policy that says that water quality and water quantity are directly related, and we believe that both must be addressed in State integrated plans for water quality and quantity to have an adequate impact on the improvement of our water resources for fish and aquatic life.

Wetlands in their natural state, we believe, perform ecological functions that are impossible or costly to replace and are vitally important to the environment and economic health of the Nation.

Last year we came before this subcommittee to testify on the merits of H.R. 5070, the DeLauro-Lowey Water Pollution Control and SURA Restoration Financing Act. In our testimony we noted that the outstanding work of your esteemed colleagues offered an opportunity to better integrate planning and development decisions at an ecosystem or a bio-region level.

This year we are pleased at the introduction of the president's economic stimulus package, and we note that it contains a major focus on infrastructure investments that are ready to go. We suspect that those ready-to-go projects are the ones that have benefited from sound planning approaches.

APA believes strongly in the merits of the watershed planning approach. There are many signs that the benefits of sound planning are becoming more widely recognized.

In 1991 the State of North Carolina developed a whole basin approach to water quality management. Throughout 1991 and 1992, State water managers and others have begun to focus on the concept of a watershed or basin approach to water quality management as an organizing framework for the Clean Water Act.

Just last week over 900 persons participated in an EPA conference on the subject of watershed planning and management. Throughout America hundreds of watersheds in several States provide good examples of the application of planning approaches to watershed management.

I have developed watershed management programs in places as diverse as Austin, Texas; Madison, Wisconsin; and the State of Connecticut. In our own area of Jefferson County, Kentucky, a recent effort at protecting an environmental sensitive stream led by our County Judge Executive has used zoning and development standards to protect the character of the watershed and prevent water quality degradation.

The American Planning Association thus strongly supports the watershed approach as an effective tool to coordinate and integrate programs required by the Clean Water Act. We believe that the benefits of watershed planning fall into three major categories; that is, that they allow improved program efficiency, increased clean water program effectiveness, and better consistency and equitability in that they address tradeoffs between point and non-point sources and can allow for new growth.

North Carolina is but one of the many States that are exploring or have implemented watershed based approaches. Several sections of the Clean Water Act require or strongly encourage a watershed approach to water quality management. However, it appears that piecemeal implementation of the Act, a fragmented approach to funding, and a variety of separate recording requirements have dis-

couraged States and localities from pursuing integrated watershed wide approaches.

We would urge that you look at barriers to carrying out watershed based planning as you proceed on your work on reauthorization and that you attempt to remove any barriers that you identify.

Last, we have several additional recommendations for your consideration as you undertake your work:

We believe that the planning process for controlling non-point sources needs to be improved. We recommend consistency between local land use plans and State water quality plans including non-point source reduction. As mentioned previously, we believe that the program needs to shift to implementation and away from demonstration.

Second, we support providing opportunities for joint management of ground and surface water supplies and believe that the Clean Water Act reauthorization should take the first step in encouraging States to develop plans that address the interactive nature of water supply and waste water issues.

Third, the Federal Government should establish a long range capital planning budget, and we believe that funds should continue to be appropriated to the State Revolving Fund. For communities in economic hardship, additional SRF funds should be made available and payback periods should be extended.

The State Revolving Fund Program should be continued at least through 1999 with Federal capitalization funds of at least \$2 billion annually. We also believe that as part of a shorter term economic stimulus package, up to \$5 billion annually could be provided, including needs for safe drinking water.

A goal of an overall net loss of the Nation's remaining wetlands should be included and clearly defined as you work on the Clean Water Act reauthorization, and we believe that you should encourage a partnership approach between Federal, State, and local governments for the protection of wetlands. That partnership should include land use planning approaches that can be encouraged to better protect wetlands.

Last, the Association fully supports adequate Federal funding for State and local governments to carry out and manage their responsibilities under the Clean Water Act, and we note in that regard that current State management needs are estimated at \$700 million annually and that section 106 appropriations must be dramatically increased.

Let me conclude by thanking the Chairman and the committee for inviting us to testify, thus providing the planning profession an opportunity to share with the subcommittee our thoughts on the Act. I would also like to stress that recent models such as the Intermodal Surface Transportation Efficiency Act demonstrate the merits and provide a good model for use to develop a participatory integrated Federal, State, local planning partnership approach.

Thank you very much, and I would be happy to address any questions you have.

Mr. APPLEGATE. Thank you, Mr. Freund.

Mr. Tucker.

Mr. TUCKER. Thank you, Mr. Chairman. My name is Scott Tucker. I'm the Executive Director of the Urban Drainage and Flood

Control District in Denver, Colorado. The district, you might note, is a multicounty agency covering parts of 6 counties and 30 municipalities.

Today I'm appearing on behalf of the National Association of Flood and Stormwater Management Agencies, which we call NAFSMA. We appreciate the opportunity to present our views to the committee.

Pursuant to the Clean Water Act of 1987, some 200 larger cities and counties serving a substantial portion of urban America have or will soon submit their applications for NPDES permits for their stormwater systems.

Despite considerable uncertainty and local resource constraints, the commitment of local resources to respond to this mandate has been significant. By NAFSMA's estimate, these 200 cities and counties have spent over \$130 million just to prepare applications.

For example, it cost over \$2 million to prepare separate applications for the cities of Denver, Lakewood, and Aurora, Colorado. Much more will be spent by these cities to comply with the requirements of the permits.

The programs that municipalities must develop to control pollutants conveyed by municipal systems will be new programs. And, unfortunately, we do not know how to predict their performance or effectiveness. In short, the Nation's larger cities and counties are now embarked on a large demonstration program. We bring this to your attention to assure you that a considerable effort has been made and will continue to be made to reduce pollutants in stormwater in spite of some doubts and concerns.

There's a need to emphasize in the Act more definitively that municipal stormwater systems convey, not create, pollutants that are generated by many widely dispersed sources. As such, municipal stormwater systems are more like non-point than traditional point sources. Unfortunately, the NPDES program has been developed and applied primarily to the regulation and control of point sources and does not lend itself well to non-point pollution control.

Short of massive engineering solutions involving costly storage and treatment of municipal stormwater, we must rely on programs with source control, pollution prevention, public education and so on. It is important to understand that compliance with or water quality standards in every storm event cannot be achieved. Clarification of the use of water quality standards and objectives as applied to municipal stormwater is needed to account for the fundamental difference between municipal stormwater and the traditional waste water and industrial effluent point sources.

This is a critical issue to us because without a clarification municipal stormwater systems are subject to being held to standards they cannot achieve. Water quality objectives for stormwater need to be developed that properly relate designated uses and are technologically and financially achievable. Existing water quality standards can be used to measure progress but compliance should be measured by performance of the practices specified in the permits.

NAFSMA is concerned about the lack of Federal and State commitment to stormwater problems. Their main concern seems to be how much it will cost them to administer the regulatory programs

which is a small fraction of what it will cost local governments to comply with permit mandates.

There are some pollutant sources for which control can best be addressed at the Federal level. For example, initial rough estimates by a California stormwater permittee is indicating that copper in brake pads may be the primary source of copper in stormwater. Studies at the Federal level could determine the extent to which this is the case. If further study would verify this to be the case, consideration should be given to eliminating copper from brake pads, but local governments cannot or should not be expected to remove it from the stormwater.

Finally, NAFSMA believes that we are not ready to proceed with a statutory expansion of the stormwater permit program beyond the sources that are presently subject to permit requirements. It is crucial that we gain more experience and knowledge from the significant effort that is now underway for phase one of the program.

Again, we thank the committee for the opportunity to share the views of NAFSMA on the Clean Water Act reauthorization. If appropriate, I'd like to request that the NAFSMA report that was referenced in our formal statement be included as a matter of record. It's a survey NAFSMA conducted of the cost of permit applications.

Thank you, Mr. Chairman.

Mr. APPLGATE. Without objection, it will be.

And at this point before I go to the next witness, I think our best bet would be to recess for about 15 minutes, and if you would just hang in there, we have an extremely important vote that we have to make. I think it's the journal.

But, unfortunately, these are one of those necessary things that we have to do, and we will be right back.

[Recess.]

Mr. APPLGATE. The ranking member has not returned yet, but will be here shortly. But I think that we'll go ahead and resume our hearings, and we will go to Mr. Harrison.

Mr. HARRISON. Thank you, Mr. Chairman.

I'm the General Manager of the Fresno Metropolitan Flood Control District in Fresno County, California, and I'm appearing today on behalf of the California Stormwater Quality Task Force, which I served as chairman for the past 3 years.

The task force is a rather unique organization of some 500 parties represent municipalities, business, industry, regulatory agencies, and independent technical firms. It has been recognized by the California Water Resources Control Board as its advisory unit on implementation of the stormwater sections of the Clean Water Act and work of the task force has led to the development of progressive stormwater quality compliance programs across the State.

Through the leadership of the task force, seven of our largest metropolitan counties containing in excess of 15 million people in dozens of cities have been operating under regional stormwater NPDES permits since 1990 implementing a variety of comprehensive stormwater quality improvement programs.

It was our privilege to testify before the committee in April 1991. At that time we could only predict the problems that we foresaw and the implementation of the stormwater rule. Today we can define and quantify those problems, we can describe for you the di-

lemma that it has created for local government, and we can more importantly I think provide a specific proposal for a functional remedy.

The problem is somewhat of a simple one. Though clearly unintended, the stormwater quality mandate today is now existing end-of-pipe water quality objectives, but even with massive treatment and structural measures, the tremendous number of variables in stormwater flow and in urban pollution make achievement of end of pipe objectives impossible for stormwater discharges.

As simple as the problem is, it is horrendously expensive. Quite bluntly, Mr. Chairman, we believe that the stormwater quality mandate appears to be the most expensive in our country's history. As you've already heard, the cost of preparing a municipal permit application is averaging \$761,000 per community or \$140 million nationally. And this expenditure only initiates the paperwork; it does not begin to pursue any stormwater clean up activity.

The initial capital cost to pursue compliance with existing water quality objectives for stormwater systems is now estimated at \$400 billion. The continuing annual cost for operations and maintenance of those stormwater systems focused on existing water quality objectives is over \$500 billion per year.

The city and the county of Sacramento alone would incur cost of \$2 billion, that based on a complete attainability analysis conducted in that community. Even with such massive expenditures, stormwater discharges still cannot consistently achieve the water quality objectives as they're currently stated.

I should note a parentheses at this point with respect to the discussion on the SRF program. More to the point, the SRF program simply does not work well for the stormwater compliance programs recognizing that many of those programs are software (house-keeping) practices rather than hardware (structural) systems.

The dilemma for our local government is a painful one. The cost of our total environmental mandate and the cost of the stormwater mandate alone exceed the capability of local government. The cities of Columbus and Anchorage have calculated environmental program compliance costs of \$1.6 billion and \$430 million respectively.

This cost represents per capita cost of up to \$1,800. What we're finding in the Sacramento area is that the per capita cost of the stormwater compliance effort alone is \$1,900. The stormwater quality issues faced by local government clearly are seen in their impact on other public services, that is, being forced to chose between basic services.

In a recent briefing of my own board of supervisors on the needed stormwater quality tax, the chairman noted that before raising our taxes to pay for stormwater quality, I should consider that perhaps half of the county fire stations are going to be closed this year and that our jails are going to be releasing prisoners early because of revenue shortfalls.

During the past 2 years, our task force has led discussions not only within the State, but across the country with business, industry, environmental and governmental interests, and from those discussions, we think we've been able to identify principles upon which can be constructed a functional stormwater quality program.

We believe that our legislative proposal, which we've attached to our written statement, incorporates those principles. It is environmentally responsive, and we think proactive. We believe it protects and continues progress toward national water quality objectives. We think it is reflective of regional needs and variations and allows States the flexibility and discretion that they need to develop stormwater programs. Importantly, we think it's measurable and enforceable, and we think it holds municipal permittees accountable to their program efforts, and certainly it protects local municipalities against the unachievable compliance mandates and indefensible enforcement actions.

As presently structured, Mr. Chairman, the stormwater section of the Clean Water Act creates a regulatory program in which the large majority of participants will be in continual and unavoidable violation of the law. Such a program is not what Congress intended, it cannot achieve its objectives, and we believe it can only collapse under the weight of an impossible compliance burden.

It has been the effort of our task force to identify the constructs of a workable stormwater quality program, and now the task is before the Congress to amend the Clean Water Act in a way to make that workable program the legal program.

We certainly appreciate you and your staff and the time and interest that has been shown to the stormwater issue, and we'll be happy to answer questions or provide any addition information that you would need.

Mr. APPLGATE. You're very fast.

Mr. HARRISON. Thank you, sir. That's a compliment.

Mr. APPLGATE. Now Ms. Dunihue.

Ms. DUNIHUE. Thank you, Mr. Chairman and members of the subcommittee.

I am Anne Dunihue, a publicly-elected director of the Chino Basin Municipal Water District of Rancho Cucamonga, California. Chino Basin is a wholesaler of water in addition to its primary activity of wastewater treatment for more than a half million people in southern California.

I am here today as president of the California Association of Sanitation Agencies, otherwise known as CASA. In the interest of time, I will summarize my written testimony:

CASA is a Statewide association of ninety small, medium, and large wastewater treatment agencies that collectively serve more than 15 million people throughout the State of California, over half the population of the State.

CASA members have a long history of providing wastewater treatment to the State's residential, commercial, and industrial facilities. Many of our members have begun providing water reclamation services. This is part of pollution prevention initiatives and to enhance water conservation.

Since 1972, CASA agencies have endeavored to work with EPA and industries to implement the requirements of the Clean Water Act. We are pleased to have the opportunity to recommend Clean Water Act policy revisions.

A number of clean water policy issues are ripe for the subcommittee's review. In the interest of time, I will address two key issues:

One, the need to develop a comprehensive watershed management approach to guide clean water policy and regulation. We must replace the current top-down "command and control" approach to address all water pollution sources in a cost-effective manner.

And, second, renewal of the SRF with adequate funding levels. Water quality improvement and protection in the 1990s and beyond will require a policy that differs from those of the past. In the 1970s, we relied on the control of conventional pollutants through the application of technology-based controls on point sources. This approach has resulted in significant water quality improvements.

The 1987 Act heralded a significant change in water pollution control mandates, a shift away from a technology-based approach to a water quality-based policy. The amendments embody a command and control approach that provides little flexibility to address site specific-water quality problems.

In the past two years CASA has worked with a number of groups seeking a consensus on developing a watershed management approach. It makes little sense to require compliance with numeric standards or effluent limits in permits until all sources are addressed in a coherent plan.

This is especially true as all levels of government grapple with limited budget resources. The San Francisco Bay area provides a good example of how the existing command and control approach fails the public.

Since 1960, San Francisco Bay area POTWs have spent more than \$3 billion to upgrade wastewater treatment systems. These improvements have resulted in 95 percent removal of conventional pollutants and reduced toxic discharges. These POTWs estimate the cost to meet water quality-based metals limits at \$1 million for each one million gallons per day discharged. This could total as much as \$1.1 billion per year.

California's State Water Resources Control Board has estimated that POTWs and other point source dischargers contribute less than three percent of the total pollutant loadings to the Bay. Alternatively, riverine, urban, and non-urban run off contribute approximately 16 percent, 58 percent, and 19 percent respectively.

Even if all industrial and municipal discharges achieve the goal of zero discharge, this would result in a reduction of less than 310 tons out of a total of 9,600 tons each year.

We urge you and your colleagues to re-examine the fundamentals of clean water policy. This will ensure that water pollution control mandates conform to the complicated nature of water resources protection. While CASA does not formally endorse any specific watershed management proposal at this time, we have identified the following seven elements as essential to any watershed program:

First, review of pollutants. Based on existing information, identify those pollutants in each watershed that may be interfering with the attainment of current water quality standards.

Two, survey of pollutant sources. Based on existing information, identify all significant point and nonpoint pollutant sources that may be contributing to violations of water quality standards.

Three, monitoring. A multi-year monitoring program should be designed and implemented to characterize existing conditions and the significant sources of pollutants in a watershed. This character-

ization would provide information on water column concentrations, sediment conditions, habitat, and biological resources to assess the degree to which beneficial uses are impaired.

Four, identifying high priority waterbodies. Based on monitoring programs and the most accurate methods available for assessing compliance, waterbodies that violate water quality standards are identified.

Five, site-specific water quality standards. Develop site-specific water quality standards for the identified watersheds. Such a plan would comply with the Clean Water Act and applicable State law.

Six, waste load allocation. Establish total maximum daily loads for identified water bodies including a waste load allocation for point sources and a load allocation for non-point sources.

Seven, Watershed program implementation. A program should require compliance with agreed-upon measures within ten years from the date of adoption. It would include a schedule with important milestones to ensure timely implementation and compliance. Implementation plans should be feasible, taking into account institutional, technological, financial, regulatory, and socioeconomic constraints.

In summary, watershed management addresses the technical issues behind our efforts to restore the ecosystem. However, adequate funding for wastewater treatment needs is no less important. Since the 1987 amendments, Congress has funded construction assistance for wastewater treatment facilities through the SRF program. CASA supported this transition from the traditional grants program during the debate on the 1987 Act. We welcome President Clinton's request for an additional \$845 billion in SRF assistance in 1993. This means the SRF program authorization will be fully funded.

However, meeting statutory obligations and actual needs are two different matters. California's funding needs are conservatively set at \$5 billion. Estimates of total need beyond the decade far exceed this figure. Nationwide funding needs exceed \$110 billion. Continued Federal support of the SRF program is critical for two reasons:

First, construction of these facilities directly benefits the environment by restoring habitats and preserving our gains.

Second, the program supports long-term economic growth. It enhances a local community's capability to accommodate residential, commercial, and industrial growth in a manner protective of the environment. The administration's preliminary economic plan identifies its intention to create a new SRF program in 1995.

The administration proposes to provide \$2 billion per year to the SRF through 1997. CASA believes this commitment is a good start. Nonetheless, we recommend a minimum of \$5 billion per year in Federal funding for the SRF. This level would constitute a return to historic funding levels.

If we as a nation require compliance with increasingly stringent Federal water pollution control standards, then the Federal Government has a responsibility to assist us in meeting these mandates. In addition to providing adequate Federal assistance, CASA also recommends that the subcommittee take the following steps:

One, specifically authorize SRF funding to support priority pollution prevention projects such as wastewater reclamation.

Two, revise the Federal allocation formula used to allocate assistance to the States. Any formula must take into account population growth in addition to water quality needs.

Three, clarify that point source pollution control construction assistance continues to be the priority unless a watershed management plan is adopted that contains mutually acceptable alternatives such as estuary protection, nonpoint source abatement, or other activities.

As you contemplate revisions to the SRF program, CASA encourages you to consider new priorities for use of these funds. As secondary treatment needs are met, Congress should consider how to best redirect available assistance. Pollution prevention should be a top priority.

One of the most promising pollution prevention programs involves wastewater reclamation. This kind of project provides environmental benefit by reusing treated wastewater and minimizing pressure on already limited water supplies.

Finally, CASA would like to address the Administration's proposal to create a drinking water SRF program that would assist municipal compliance with Safe Drinking Water Act requirements. Many CASA agencies perform dual services, providing waste water treatment and drinking water supply, which is the case at Chino Basin.

Federal assistance to drinking water suppliers would mark a milestone in the federal-local partnership that is long overdue. CASA supports the Administration's commitment in this area.

Nonetheless, we are deeply concerned that we avoid the trap of robbing Peter to pay Paul. Any drinking water SRF program must stand on its own merits. Limiting wastewater SRF funding would dilute the progress made to date. Therefore, while we encourage this new Federal partnership, we hope that its funding will be secured without sacrifices from the wastewater community.

As I noted earlier, California alone has more than \$5 billion in wastewater construction needs that are eligible for Federal SRF assistance.

Mr. Chairman, there are a number of other clean water issues that concern CASA. These include retention of the domestic sewerage exclusion, requirements to control stormwater and CSOs through costly technology-based standards, and limits to the interstate transport of solid waste that could inadvertently include sewage sludge.

CASA looks forward to working with you and the committee to ensure that renewal of the Clean Water Act also addresses these important issues.

Mr. Chairman, this concludes my testimony. I would be pleased to answer any questions you or your colleagues may have. Again, CASA appreciates the opportunity you have extended us to participate in this important endeavor.

Thank you.

Mr. APPLGATE. Thank you, Ms. Dunihue, and thank you all very much for your testimony.

I'll see if I can start some place here because there's a lot of stuff to talk about.

Let me see here, first of all, I guess I did want to mention, Mr. Harrison, your problems with the current statute. You mention in here—you talk about some humongous figures. I mean, it even staggered my mind and I deal in big bucks here—but you mention in here that the national survey by the National Association of Flood and Stormwater Management Agencies has determined that the cost of the municipal parts to stormwater—any way, it gets down to saying will exceed \$140 million or an average of \$761,000 per community.

That's a huge amount of money, and, you know, I'm like you. I think it's very high, and, obviously, whatever cost go into preparing these programs and all, it's drawing down—I think you had mentioned or maybe Ms. Dunihue had mentioned—that it's drawing off of other necessary needed programs in communities. There's no question about it.

But where do you come out with such huge figures because in number four then, and I'm not sure whether this is misprint or not, but you talk about nationwide survey also conducted by the American Public Works Association that determines the initial cost of the attempt by municipalities to achieve water quality objectives as currently expressed will total \$415 billion and that continual annual cost will total \$542 billion.

That's more than half a trillion, and I know that—now you're just talking about—you're zeroing in primarily on stormwater problems.

Mr. HARRISON. That's correct.

Mr. APPLEGATE. Can you give me a little idea as to where all this money is going to go and even in the permit figures that you give.

Mr. HARRISON. The study on the application cost was in fact a study of contacting some 200 local municipalities who are required to prepare permits under the existing 1987 Act amendments and their related stormwater regulations, and that's the actual cost the folks are incurring. The cost of my permit was \$700,000, the one for Mr. Tucker was a couple of million dollars in his area, and the \$760,000 is the average actual cost, and they're running half a million to two million dollars, per community just to prepare the application to get an NPDES permit for the municipal system.

Mr. APPLEGATE. Now you sent this out to how many different—this survey out to how many different places? It was conducted by how many different places?

Mr. HARRISON. The 200 that are currently required to secure permits under the existing regulation.

Mr. APPLEGATE. What size communities are we talking about?

Mr. HARRISON. These are municipalities 100,000 and larger.

Mr. APPLEGATE. One hundred thousand and larger.

Mr. HARRISON. It does not address, of course, the second half of the program, which ultimately will require all communities of any size to come under compliance with the Act with respect to stormwater discharges, that that is still being debated as to how that's going to be implemented.

It also does not count the cost of compliance by the industries who must have separate individual stormwater permits for their sites or for all construction sites across the country, which must also get separate construction sites. And it's not uncommon to find

compliance costs in those areas of tens of thousands of dollars per individual site if not more.

The actual implementation cost, the numbers in the billions, is in fact again from a nationwide study looking at the cost of actual stormwater clean up efforts that are being carried out across the country, looking at things like the attainability analysis that was conducted by the community of Sacramento to try to bring their stormwater discharges into compliance with existing water quality objectives established for the American river.

What is not frequently understood is that the receiving water standards today are stricter for many constituents than drinking water requirements, and you're talking in terms of stormwater with huge volumes of water coming in very short periods of time, that are required to meet these numbers.

We have a serious construction problem in the way the original act addressed stormwater, and it's our approach to try to find a workable solution, thus the draft legislation that we've assembled for your consideration.

Mr. APPLEGATE. Is this based on the assumption that the vast volume of stormwater would have to be treated to secondary treatment standards?

Mr. HARRISON. And more.

Mr. APPLEGATE. And what?

Mr. HARRISON. And more. Secondary treatment will not get you there and in fact we know of no treatment methodology available today that would allow stormwater to meet the numbers. The irony of the attainability analysis in the Sacramento case was that after spending \$2 billion—that's b, billion—for that community, some \$2,000 per capita, they still could not hit the numbers for lead and copper in the receiving waters.

Mr. APPLEGATE. They can't hit the numbers. So what needs to be done to correct that?

Mr. HARRISON. We believe that we need to go back and re-examine Congress' original intent of looking at stormwater programs, where you're looking at comprehensive community-wide house-keeping programs to address the things that cause stormwater to be dirty, rather than looking at putting treatment systems on the end of pipes.

Mr. APPLEGATE. I think you and Mr. Tucker had both mentioned the problem of municipalities being able to control inputs into stormwater systems such as run off of pesticides and oil from cars and that type of thing.

Do you think that local government should have greater authority to ban certain chemicals that are degrading to surface waters?

Mr. HARRISON. That's I think the question that we're laying before you. Many of our programs are now doing detail source investigations. The Bay area program was required to do so under a related program and that's where we found the information having to do with the copper loadings. Their stormwater system is under a mandate to remove copper, but they have no authority to control the makeup of the brake linings which seem to be the source of the majority part of the load.

The question is should we have a national standard that says that you're not going to have copper and brake linings? The answer

is probably yes, but I'm not sure that I as a local stormwater manager am the one to write that rule or to implement it.

Mr. APPELEGATE. Just as a point of interest, I'm curious and I happened to ask all of them this but we're working within a very tight budget and we're trying to resolve over the next few years as to how we can get the deficit down. And I know that the people in your sad situation are looking for more money to try to help them handle these Federal mandates, and so I commend you for that.

How do we stay within those budgetary figures, how do we handle the deficit, and where does the money come from?

Ms. DUNIHUE. That's a very good question. I wish I had the answer for it. I do have a regulatory person here from CASA that could possibly give you some insight into it or provide information in a written form to you.

Mr. APPELEGATE. Okay.

Ms. DUNIHUE. But California does have tremendous needs.

Mr. APPELEGATE. I know you do. You're a very vast community out there, and you're up above, what, 50 million?

Ms. DUNIHUE. I believe it's closer to 30 million.

Mr. APPELEGATE. Oh, is it 30? I think in terms of numbers of Congressmen. I guess we have about 50 of those. [Laughter.]

You had advocated giving the States primacy in developing and implementing standards that provide for the highest beneficial use in environmental quality that is reasonably attainable.

How would you propose changing existing law which requires that States develop water quality standards to accomplish that? How would your idea differ from the existing programs?

Ms. DUNIHUE. Mr. Chairman, I would like to defer your question to one of our CASA regulatory people that is here with me, if I might.

Mr. APPELEGATE. Sure.

Ms. DUNIHUE. Ms. Bobbi Larson.

Mr. APPELEGATE. You're perfectly welcome to take the microphone and address that.

Ms. LARSON. Thank you, Mr. Chairman and subcommittee members.

Mr. APPELEGATE. You can sit down; pull up a chair so you don't have to stand. There you go.

Ms. LARSON. I don't think that I'm any better equipped than our president to answer the first question as far as what we do about the deficit and all the competing funding needs. But in terms of that question and the question that you just answered, that's why we and so many others have come forward with the recommendation to establish a watershed management approach to water quality because we feel that that approach involves not only local flexibility, but it also allows regulators to choose the most cost-effective solution to water quality problems.

So if you have a problem with copper in a water body and you have a certain amount of copper coming from point sources, a certain amount from stormwater run-off, and a certain amount from abandoned mines and you know that you can meet the water quality objective by controlling one of those three or any one of those three, you choose the most cost-effective way of doing it and fund

it that way rather than saying we simply have only the option of requiring end-of-pipe treatment at a cost of a billion dollars.

So we think that watershed management has a lot of advantages for both the environment and the fiscal problems that we face.

Mr. BOEHLERT. Mr. Chairman, may I interject here.

Mr. APPLEGATE. Yes, Mr. Boehlert.

Let me ask you, the whole Palo Alto thing just is mindboggling, a hundred million dollars, and if you had the flexibility, it could go upstream a little bit and do some things differently.

What impediments are there in the present law that prevent you from doing that?

Ms. LARSON. Well, the present law is predicated on a sort of "command and control" approach or more of a prescriptive approach. We find with our State entities, for example, that they feel that EPA does not give them the flexibility to do the kind of things that we're asking for. And we think we need a nationwide direction to the regulators both at the Federal and the State level that this is in fact what the Congress wants to see and that we want to change our regulatory focus from this limited historical approach to one that's more suitable to the kinds of problems that we face in the watersheds.

Mr. BOEHLERT. So in the Palo Alto case, if I may continue, I mean, you felt you had no choice but to go ahead with that hundred million dollar program?

Ms. LARSON. I'm not—I'm sorry, I'm not familiar with specifically what occurred in Palo Alto.

Mr. BOEHLERT. Okay, well, it's in Ms. Dunihue's testimony and that sort of thing I find mindboggling.

Ms. LARSON. Oh, we're talking about copper loadings to San Francisco Bay?

Mr. BOEHLERT. Yes, right.

Ms. LARSON. Okay, I'm sorry. What we're facing now are these new metal limits and permits in the San Francisco Bay area and our regulators have said that they have no choice but to put those numbers in the permits and that we must meet them. That's why we're here advocating watershed approach because we are finding things like the example that was mentioned about the copper in the brake linings.

The city of Palo Alto actually tried to do a product ban. They tried to ban the use of copper sulphate as a root control and what they found was that they had a lot of cooperation from the local merchants; they took it off the shelves voluntarily. But the way the Bay area is, and many other areas, cities are right next to each other and you can go from one city to the next or even regionally. With things like brake linings, it just doesn't make sense from a local level and we think those are the kinds of things that need to be addressed at the national level as opposed to the local level.

Mr. BOEHLERT. Thank you very much.

Thank you, Mr. Chairman.

Mr. APPLEGATE. Thank you, Mr. Boehlert.

Mr. Kirk, I guess perhaps I should address that question that I addressed to Ms. Dunihue more to you because you're advocating \$6 billion—

Mr. KIRK. Billion.

Mr. APPLEGATE. I thought I said billion. We get confused with those M's and B's—

[Laughter.]

Mr. APPLEGATE [continuing]. And so I'd be interested in hearing what you have to say. Of course, the budget calls for two, and we're sort of tied into that right now. And I'm just wondering if you have any reflections on that as to the source of the revenue that your organization feels would be able to fund that State Revolving Fund.

Mr. KIRK. It is a good question, and we do recognize that the numbers that we're asking for are extremely high. We have taken a serious look at proposals that have been talked about in terms of focusing on dedicated revenue sources as a way to raise some additional funds over and above general revenues. And I believe our association or members would support some serious consideration be given to tapping resources such as these dedicated revenue sources that might include product taxes, or taxes on fertilizers, and pesticides, or other types of things that are directly associated with impairments in water quality.

The numbers are high, \$6 billion is very high, but by the same token, the numbers at the local level are extremely high too.

Mr. APPLEGATE. Yes, they certainly are.

I had a question here that has been of interest to me because I have introduced legislation to try to help the States, and you oppose what you call unreasonable restrictions on the interstate transport of sewerage sludge or what they call biosolids as it's now known.

Can you tell me what you think is unreasonable restrictions, and don't you think the States should have—since we always look at the States to be able to protect the health and welfare of its citizens—to be able to regulate this interstate transportation of waste coming into their States? Well, there is legislation in now, which I have introduced and I've joined with others to allow the circumvention, more or less, of the prohibition by the Constitution, which says to the States, you have that right or the local communities have that right to make the determination if you want to come in or if you don't.

Mr. KIRK. It's a very good question, and I would answer it by suggesting that, you know, for years and years and years, going back to the mid-1970s, the Federal Government, the Congress, EPA, and other Federal agencies have encouraged all of us at the local level to clean up the water. The reason we have a biosolid or a sludge problem today is because the program has been successful.

We have also been encouraged to promote the beneficial use of these products, so in one sense, they're not waste. And if they're not waste and they can be beneficially reused, we believe it's extremely important that there not be barriers to the transportation of these products between State lines.

It's very, very difficult to develop programs to promote the beneficial reuse of sludge or biosolids, as it is now called, as it is. We don't need any further barriers.

Mr. APPLEGATE. Well, of course, it's good for one side and not good for the other—the sender or the sendee—and I know that there's an exceptional amount that comes into Ohio, as in the case of landfills and places like that.

What happens if the sludge is destined for a landfill?

Mr. KIRK. I really wasn't addressing myself to the situation of a landfill. I was addressing the situation that involved the transportation of biosolids across State lines for land application or other beneficial uses, and I think there is a distinction to be made between the two. If a waste is going across State lines to be disposed of at a landfill, it is more of a waste and not a product. And that is a very important distinction.

Mr. APPLGATE. Well, that's my concern and that's my direction rather than the use of the sludge as byproduct, but I don't have any real objections to transporting any of that stuff. It's just that it's going to end up in landfills or strip fields or different things like that, and it does pose a problem.

Anyway, I just have one quick question. We don't have a lot of people here, so we can extend it maybe a little bit.

We do appreciate the efforts of your organization to develop a watershed management proposal. That seems to be something that a lot of people are looking to. Included in that proposal is the creation of a watershed management commission or more than one.

And tell me why it's necessary to create a new level in the process between local government and the States, and how the commissions would operate.

Mr. KIRK. Our proposal calls for the establishment of watershed commissions by the governors of each State and also encourages local governments to play a major role in the process of establishing those commissions.

In cases where there are existing governmental entities that can focus on the same types of issues to the same degree, I think our proposed language has sufficient flexibility and latitude to allow that to happen. But the key point is that we want to make sure that the stakeholders within each of the watersheds that would be established are brought to the table and given an opportunity to participate in this process, which in our view, is a bottom-up approach, as was mentioned earlier, and not a top down approach—although within our proposal, the Federal Government and the State government would play a prominent role in participating on the commission, overseeing the activity of the commission, approving the plan, and implementation through the existing mechanisms of the Clean Water Act.

Mr. APPLGATE. Anyway, you feel there's a real need to develop the management commission. It's not just creating another expensive level that we have to just continue to add on.

Mr. KIRK. I think it's important because I think you have to start someplace. A lot of people would say and have suggested that there isn't a need to amend the Act in any major way because authority apparently exists within the statute.

I think we're talking today about the need to re-evaluate how we have approached clean water problems, considering the funding constraints at all levels of government, and the types of problems that we're going to be facing in the future. And I think it's going to take a lot of time, and a lot of effort, and a lot of work and money. But the time to begin that process is now because we have a long way to go, and I don't think we're going to make the same

kind of progress that we've had over the past twenty years in the next twenty years if we don't make the change beginning today.

Mr. APPLGATE. Okay, all right. I can appreciate that.

Well, I'll end that and yield to our former county executive who I'm sure has some very straight-forward and pointed questions.

Mr. BOEHLERT. Well, I just want to ask Mr. Kirk, you talked about the grant program working before—I'm sure it worked—but are you advocating that we re-institute a grant program?

Mr. KIRK. Our position is that the Congress should continue to capitalize the State Revolving Loan Program and, in addition to that, complement the loan program with a grants program, and authorize the states to use those grant funds to address particular problems within their states that may not be easily dealt with or appropriately dealt with through a loan program.

So in one state a governor or the state department may decide that grants should be available for hardship communities, or smaller communities, or CSO communities. And in each case, the State would be able to develop a program that ensured that the loan program and the grant program were working in concert, and there would be no one waiting on line for a grant simply because they were available.

Mr. BOEHLERT. Yes, I'd like you to rethink that, if you will. At least give some thought to the concept of principal subsidy program. I mean, I like the idea. I think we should put more money into the State Revolving Fund. I think we should give more flexibility to the State governments, but the principal subsidy program is one that I'm enamored with because I think that gets more projects going and that's the whole objective of the program—to get more projects going. And when we have the grant money, the winners are very happy—and I understand that. I used to be on occasion very happy as a county executive when we won some of the sweepstakes that we were competing for down here. But our objective if we get a much broader mandate is to get as many projects going as we possibly can to clean up the Nation's waters, so take a look at that please.

Mr. KIRK. We will, Congressman.

Mr. BOEHLERT. Thank you, and then, Ms. Dunihue, that Palo Alto thing keeps hitting me back. I like the idea of watershed management, regional management. It makes so much more sense than the way we usually do things.

Have you given any thought or would you give some thought to a pollution permit trading system, much like we've initiated—launched under the Clean Air Act amendments? Maybe we could do something like that and if we did it on a watershed or regional basis, Palo Alto would not have had to spend a hundred million dollars. You might have been able to more effectively use that money elsewhere.

So do you have any comments or thoughts on it?

Ms. DUNIHUE. I think that's an excellent suggestion, and we have begun to explore the idea of trading. Up until now, there's been a lot of attention focused on point types of trading, and we're thinking that if it's broadened to a watershed concept, that the trading concept fits right in with that; that you have a water body that has a certain limit of the input that it can take and that you

design the program to manage those inputs. And perhaps you do say, well, we're going to control this source upstream in a more cost-effective way than we could control this source and we achieve the same goal without spending unnecessary amounts of dollars.

So we think it's an idea that has a lot of possibility.

Mr. BOEHLERT. I would greatly appreciate it and consider it a personal favor if you would collect some of your thoughts on that, and at your earliest convenience, share that with me and the committee, but particularly address it me, will you, and I'll share it with the committee. But I think that's moving in the right direction.

You know, Washington is not the source of all wisdom, and I think there is a lot of brain power out there all across America, and I agree wholeheartedly with all of the witnesses that have appeared before us in this hearing today and yesterday requesting more flexibility. And I hope all of you will take a look at the principal subsidy program and be a little more analytical as you look at the potential benefits of starting a—re-instituting a grant program.

And I understand and appreciate the problems of some of the distressed communities, but I think there's a way to address their special problems through a principal subsidy program that in effect is a grant program. But it's not Washington dictating whole operation; it's the States managing within the States their program and having the flexibility to perhaps subsidize seventy five percent of the principal payment on a no interest loan for a hard pressed community.

So I think it has a lot of merit. We got to think anew.

Thank you all very much for your outstanding testimony, and I look forward to hearing particularly from you.

Thank you.

Ms. DUNIHUE. Thank you very much for the opportunity.

Mr. APPLGATE. Thank you very much, Mr. Boehlert.

Mr. Horn.

Mr. HORN. Thank you, Mr. Chairman.

One question and then I'd file the rest with the committee and coordinate it between staffs because I've missed a few minutes of some of your testimony.

Ms. Dunihue, you mentioned you seek revision of the State Revolving Fund formula, and you mentioned that obviously one factor was population growth. But then you mentioned certain other important criteria, and I'm just curious what sort of categories fall under other important criteria in a revision of that formula?

Ms. LARSON. Again, I think—if I might answer that. What we're trying to do is look at the SRF the same way we're looking at the whole water quality solution, which is based on need and the—the real need for water quality improvement in a State or in an area, and part of that is population, part of it is the water quality situation, the site-specific conditions that exist within a State, and we think we need to direct the resources to the places where there's the greatest need. And that is essentially what we were trying to get at with that.

Mr. HORN. One of the things that's concerned me with formulas, be it at the Federal or State level, is often the rewards go to those

that have done the least, and I wonder if you've had an experience with that where those that have really tried, perhaps been involved in this prior to regulation and all the rest of it, don't really get the help they need to finish the job.

What's your reaction?

Ms. DUNIHUE. Unfortunately, what does happen is that whenever you've worked hard to attain a certain standard and then you're penalized because you've been unable to attain that standard, and we found that to be true in our operations at Chino Basin and the Santa Ana River.

Ms. LARSON. Just a couple of examples and I'm not sure they're quite on point because they don't deal with funding specifically, but we have examples where there are water quality standards set by the State that go into the water quality plans and because some of our treatment plants can achieve numbers much lower than that or the regulators believe they can, it's sort of a return to a technology-based standard really. They then put those much, much lower limits into permits. We have a case—example of a Los Angeles County sanitation districts where their permit limit for toluene is 284,000 times more stringent than the applicable ocean plan. And now they're out of compliance with their permits about four times a year because they can't achieve that very, very low number that was not in fact based on a water quality need but based on what could presumably be achieved through technology.

And just in terms of the funding, I think it's a good point about the needs not only being matched up with the money because the SRF can be a very cumbersome process to go through. And in California the State water board has added additional requirements on top of the Basic Loan program. It requires water conservation programs—not that these aren't good things, but we wonder if they are really appropriate to a loan program—water conservation program capital reserve requirements, and a number of other things. And that makes it very difficult for smaller communities to participate in that process. It's a full-time job just filling out the applications and shepherding it through the process, and so as a result, we find that sometime most of the money goes to those more sophisticated agencies that can run their way through the process.

Mr. HORN. Any other comments from other members of the panel on those questions?

Mr. FREUND. Yes.

Mr. HORN. Yes, Mr. Freund.

Mr. FREUND. Let me just make one as the former administrator of the Connecticut SRF. One thing that strikes me is that there are great disparities between States in how they handle their SRF programs, and I think something needs to be done to recognize those States that make exceptional efforts.

One of the things that occurred in the State of Connecticut was that that State matched the SRF approximately three to one, State over Federal funds. It did that by establishing a separate State program, which was based on revenue bonds, on the sale of revenue bonds, which generated a revenue stream off of the interest on the loan repayments.

By adding that mechanism, that State was able to highly leverage the Federal capitalization grant, and we were able to effec-

tively provide a fifty percent grant and fifty percent loan program at very low interest rates to communities that had, in particular, combined sewer overflow needs, for example. Other communities got a twenty percent grant out of the State program money and eighty percent loan at two percent interest.

So I think it's important to think about how we can encourage States to do more with the SRF funds that they receive and how in some way those States that make an exceptional effort might be rewarded for that can and thus leverage the Federal money and make this program go much, much further in meeting the tremendous capital needs that are out there.

Mr. HORN. Any other reaction?

Yes, Mr. Harrison.

Mr. HARRISON. Just to underscore a concern and previous comment relating to the SRF program, recognizing the strengths and weaknesses, the SRF program does not work well for the stormwater compliance issues that we've addressed. Stormwater compliance generally, if it proceeds as Congress intended, is going to be programs and community housekeeping activity and loans are not well suited to non-capital expenditures. Also stormwater has neither a good solid dedicated revenue stream to generate reimbursements or repayments required by SRF loans.

Mr. HORN. Thank you.

Mr. Chairman, I have a few questions we can file for the record and coordinate so they don't overlap.

Mr. APPELATE. Thank you, Mr. Horn.

And I would say to the panel that the committee may very well have additional questions, obviously we will, and we'll have some more than that. We hope that you would answer those and get back to the committee as expeditiously as possible, and that your full statements will be made a part of the hearings.

And with that, the subcommittee will stand and recess until Wednesday, April the 14th, when at that time, we'll resume our hearings on the same subject.

Thank you very much.

[Whereupon, at 12:15 p.m. the subcommittee was adjourned, to reconvene subject to the call of the Chair.]

PREPARED STATEMENTS SUBMITTED  
BY WITNESSES

Statement of

THE HONORABLE THOMAS V. BARNES  
MAYOR

CITY OF GARY

on behalf of

THE UNITED STATES CONFERENCE OF MAYORS

on

REAUTHORIZATION OF THE CLEAN WATER ACT

Before the

SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT  
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION  
UNITED STATES HOUSE OF REPRESENTATIVES

APRIL 1, 1993

MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE, I AM THOMAS BARNES, MAYOR OF THE CITY OF GARY, HERE TODAY ON BEHALF OF THE U. S. CONFERENCE OF MAYORS. THANK YOU FOR THE OPPORTUNITY TO PRESENT OUR VIEWS ON REAUTHORIZATION OF THE CLEAN WATER ACT.

THANK YOU ALSO FOR HOUSE PASSAGE OF THE PRESIDENT'S ECONOMIC STIMULUS PACKAGE. ITS FUNDING OF ENVIRONMENTAL INITIATIVES WILL HELP OUR CITIES GREATLY. I HOPE THAT THE SENATE WILL NOW ACT PROMPTLY TO APPROVE THE ENTIRE STIMULUS PACKAGE.

#### TOWARDS CLEAN WATER ACT REAUTHORIZATION

THIS SUBCOMMITTEE FACES GREAT CHALLENGES IN REAUTHORIZATION OF THE CLEAN WATER ACT. WE PLEDGE TO WORK CLOSELY WITH YOU AT EVERY STEP OF THE PROCESS. THE CLEAN WATER ACT HAS PERFORMED SOME EXTRAORDINARY MIRACLES ACROSS THIS COUNTRY. AS WE MOVE TOWARDS REAUTHORIZATION IT MUST MAKE SENSE FOR NOW AND THE FUTURE. LET ME HIGHLIGHT SEVERAL KEY ISSUES.

#### FUNDING OF IMPLEMENTATION OF THE CLEAN WATER ACT

FOR CITIES, THE CLEAN WATER ACT IS EXPENSIVE. WE ARE DOING ALL WE CAN WITH HIGHER WATER AND SEWER RATES, FEES, STATE AND LOCAL CONTRIBUTIONS AND THE LIKE. WE BADLY NEED THE FEDERAL GOVERNMENT TO STEP UP TO THE PLATE AND HELP US MEET THESE COSTS.

WE STRONGLY SUPPORT THE PRESIDENT'S PROPOSAL TO CONTINUE THE STATE REVOLVING FUND PROGRAM AND URGE ITS REAUTHORIZATION AT \$2 BILLION PER YEAR OR MORE. THIS WILL NOT MEET ALL THE WASTEWATER

TREATMENT NEEDS IDENTIFIED BY EPA AND OTHERS, BUT IT IS WE MUST KEEP AT LEAST TO THIS BASELINE IF WE ARE NOT TO FALL FURTHER BEHIND IN MEETING THESE NEEDS. WE ALSO HOPE YOU WILL CONSIDER A PARTIAL RETURN TO GRANT FUNDING. THERE HAS BEEN SOME DISCUSSION OF A NATIONAL USER FEE FOR CLEAN WATER PURPOSES, PERHAPS LEVIED ON THOSE MOST RESPONSIBLE FOR POLLUTING OUR WATERS. WHILE THE CONFERENCE HAS NO SPECIFIC POLICY ON USER FEES FOR CLEAN WATER PURPOSES, IF THEY ARE TO BE INSTITUTED THE RECEIPTS SHOULD BE DEPOSITED IN A TRUST FUND AND MADE AVAILABLE DIRECTLY TO LOCALITIES IN THE FORM OF GRANTS THEY CAN APPLY FOR AT EPA. THE SRF PROGRAM HAS ACCOMPLISHED ITS OBJECTS BROADLY, BUT IT IS STILL VERY DIFFICULT FOR INDIVIDUAL LOCALITIES TO USE IT IN A FAST AND FLEXIBLE MANNER TO MEET CLEAN WATER NEEDS. GRANTS WILL HELP.

#### REGULATORY ISSUES

RISK ASSESSMENT. WE NEED THE HELP OF THIS SUBCOMMITTEE TO CREATE A NEW ETHIC AND APPROACH IN EPA -- NO COSTLY REGULATION UNLESS ABSOLUTELY NECESSARY AND THEN THE MINIMUM NECESSARY TO ACHIEVE REALISTIC STANDARDS. WE URGE YOU TO EXAMINE THE CONCEPT OF STANDARDS UNDER THE CLEAN WATER ACT, AND SUPPORT A WIDE-RANGING SCIENTIFIC REVIEW OF ENVIRONMENTAL RISK ASSESSMENT AND RISK MANAGEMENT PRACTICES TO MAXIMIZE THE ENVIRONMENTAL PROTECTION AFFORDED BY EXPENDITURE OF PUBLIC RESOURCES.

COMPREHENSIVE WATERSHED MANAGEMENT. WE STRONGLY SUPPORT EFFORTS TO DEVELOP AN OVERALL APPROACH TO POLLUTION PREVENTION BY FOCUSING ON COMPREHENSIVE WATERSHED MANAGEMENT. FEDERAL FUNDING AND

STANDARD SETTING FOR WATER QUALITY IMPROVEMENTS BASED ON SOUND SCIENCE CAN BE COMBINED WITH LOCAL AND REGIONAL RESPONSIBILITY FOR DEVELOPING AND IMPLEMENTING WATERSHED MANAGEMENT STRATEGIES APPROPRIATE TO LOCALLY-DETERMINED CONDITIONS AND CIRCUMSTANCES, ALLOWING LOCAL ENVIRONMENTAL QUALITY PROFESSIONALS TO DEVELOP INNOVATIVE, APPROPRIATE AND COST-EFFECTIVE SOLUTIONS TO PRESSING WATER QUALITY PROBLEMS. IN ADDITION TO SRF FUNDS, THE REAUTHORIZATION PROCESS AND SUBSEQUENT APPROPRIATIONS SHOULD PROVIDE STEADY, ADEQUATE AND RELIABLE FUNDING SUPPORT FOR LOCAL WATERSHED MANAGEMENT PLANNING AND IMPLEMENTATION.

COMBINED SEWER OVERFLOWS. THE CSO PROBLEM IS DIFFICULT AND CANNOT BE SOLVED WITHOUT A SIGNIFICANT COMMITMENT OF FEDERAL FUNDING SUPPORT TO ASSIST LOCAL COMMUNITIES IN MEETING THE NEED FOR MINIMIZATION AND MITIGATION OF CSO INCIDENTS. THE CONFERENCE OF MAYORS SUPPORTS THE ONGOING EFFORTS OF MANY CITIES AND MANY OF THE GROUPS REPRESENTED AT THESE HEARINGS TO DEVELOP A CONSENSUS FOR CSO CONTROLS AND MITIGATION, AND WE URGE THE CONGRESS AND THE SUBCOMMITTEE TO EXERCISE CAREFUL JUDGMENT IN DETERMINING WHAT LEVELS OF CONTROLS AND OF RESOURCE COMMITMENT ARE APPROPRIATE IN ADDRESSING THIS ISSUE. AS IN OTHER AREAS, IT IS IMPORTANT THAT LOCAL WATER QUALITY CONDITIONS AND SCIENTIFIC STANDARDS BE USED IN SETTING MITIGATION AND CONTROL REQUIREMENTS, AND THAT LOCAL FLEXIBILITY IN MEETING THESE STANDARDS BE PROMOTED AND ENCOURAGED TO FACILITATE THE DEVELOPMENT OF COST-EFFECTIVE LOCAL APPROACHES TO OVERALL CSO IMPROVEMENTS.

GREAT LAKES ISSUES. EPA IS EXPECTED SOON TO PUBLISH LENGTHY AND COMPLEX GUIDANCE FOR THE GREAT LAKES WATER QUALITY INITIATIVE, TO CONTINUE THE SIGNIFICANT AND ONGOING PROGRESS WHICH HAS BEEN MADE IN IMPROVING AND PROTECTING WATER QUALITY IN THE GREAT LAKES. AS WITH OTHER ASPECTS OF THE CLEAN WATER ACT, CAPITAL-INTENSIVE PROJECT REQUIREMENTS AND NON-COST-EFFECTIVE APPROACHES ON MITIGATION OPTIONS CANNOT SUBSTITUTE FOR SCIENTIFICALLY SOUND WATER QUALITY CRITERIA AND A COMPREHENSIVE APPROACH TO POLLUTION CONTROL AND MITIGATION IN MAKING FURTHER PROGRESS IN THE GREAT LAKES. WE HOPE EPA WILL WORK WITH MAYORS IN THE REGION AND THIS SUBCOMMITTEE FOR A WORKABLE GREAT LAKES APPROACH.

A REINVIGORATED PARTNERSHIP FOR ENVIRONMENTAL PROGRESS

FINALLY, MR. CHAIRMAN TOO OFTEN CITIES AND OTHER LOCAL GOVERNMENTS ARE SEEN BY EPA ONLY AS PART OF "THE REGULATED COMMUNITY" AND NOT AS FULL, PROFESSIONAL PARTICIPANTS IN ACHIEVING THE ENVIRONMENTAL PROGRESS WE ALL SEEK TO ASSURE. I AM HOPEFUL THAT BY DEVELOPING AND IMPLEMENTING SUCH INITIATIVES AS THE WATERSHED MANAGEMENT APPROACH TO WATER QUALITY PROTECTION AND ENHANCEMENT THAT FEDERAL, STATE AND LOCAL GOVERNMENTS CAN PUT INTO PRACTICE THE KIND OF PARTNERSHIP THAT I BELIEVE IS NECESSARY TO ASSURE FURTHER PROGRESS AND AVOID THE DIVERSION AND WASTE OF VALUABLE RESOURCES IN PUNITIVE SANCTIONS IMPOSED BY THE FEDERAL OR STATE LEVELS AGAINST LOCAL IMPLEMENTORS WHEN ALL ARE FACING INTENSE RESOURCE PRESSURES.

FRANKLY, MR. CHAIRMAN, EPA DOES NOT HAVE AS GOOD A RELATIONSHIP WITH MAYORS ACROSS THE COUNTRY AS WOULD BE DESIRED. THIS IS BASED LARGELY ON A LACK OF EFFORT ON ITS PART TO SEEK A PARTNERSHIP WITH ELECTED LOCAL LEADERS TO SOLVE ENVIRONMENTAL PROBLEMS.

I WOULD LIKE THIS SUBCOMMITTEE TO CONSIDER AUTHORIZING EPA TO CREATE MODELS FOR LOCAL ENVIRONMENTAL MANAGEMENT ACTION PROGRAMS WHICH WOULD DEMONSTRATE METHODS BY WHICH EPA AND CITIES COULD WORK TOGETHER EFFECTIVELY AND COMPREHENSIVELY TO SOLVE PROBLEMS. WE NEED THEIR TECHNICAL ASSISTANCE, EXPERTISE AND FUNDING, NOT JUST THE REGULATORY ENFORCEMENT SCHEMES THEY HAVE FOCUSED ON OVER THE YEARS. YOU WILL DO THE NATION'S CITIES A GREAT SERVICE IF YOU WILL HELP US IN THAT REGARD DURING THIS REAUTHORIZATION PROCESS.

MR. CHAIRMAN, THREE POINTS IN SUMMARY: (1) WE THANK YOU FOR EFFORTS TO DATE AND URGE THAT A BETTER FUNDED AND MORE FLEXIBLE PROGRAM BE THE HALLMARK OF THE CLEAN WATER ACT IN THE FUTURE; (2) WE MUST GET A HANDLE ON THE REGULATORY PROCESS TO MAKE IT MORE SENSIBLE AND THE GOALS OF THE ACT MORE ACHIEVABLE; AND 3) EPA MUST WORK BETTER WITH CITIES IN THE PERIOD AHEAD.

I KNOW THIS SUBCOMMITTEE IS COMMITTED TO THAT GOAL, AS IS THE PRESIDENT AND THE EPA ADMINISTRATOR. WE LOOK FORWARD TO WORKING WITH YOU TO ACHIEVE THESE GOALS. THANK YOU FOR THE OPPORTUNITY THIS MORNING AND I LOOK FORWARD TO YOUR QUESTIONS AND DISCUSSION.

Reauthorization of the Clean Water Act

April 1, 1993

Testimony Presented by

Anne W. Dunihue  
Director  
Chino Basin Municipal Water District  
Rancho Cucamonga, California

Mr. Chairman and Members of the Subcommittee, I am Anne W. Dunihue, a publicly-elected Director of the Chino Basin Municipal Water District of Rancho Cucamonga, California. I am here today as President of the California Association of Sanitation Agencies (CASA).

CASA is a statewide association of 90 wastewater treatment agencies that collectively serve more than 15 million people throughout the State of California, over half the sewered districts in the State.

Members of CASA have a long history of providing wastewater treatment needs for the State's residential, commercial, and industrial facilities that dates back to 1957. Most recently, many of our members have begun providing water reclamation services as part of pollution prevention initiatives and to improve on water conservation measures. Since 1972, when Congress passed the Clean Water Act, and most recently the Federal Water Pollution Control Act of 1987, CASA agencies have endeavored to work with EPA and affected industries to implement the requirements of this law. Thus, we are pleased to have the opportunity to present our insights to this Subcommittee and recommend revisions to the present clean water policy which we believe will promote sound water pollution control policies into the next century.

CASA believes a number of clean water policy issues are ripe for the Subcommittee's review and revision, but in the limited time available I will target the following matters:

- The control of pollution that relies on a top-down, "command and control" approach instead of a comprehensive watershed management approach in which contributions of pollutants from all sources can be measured and the most cost-effective means are employed to reduce those pollutants to a level where receiving water quality standards are met.
- The renewal and commitment of adequate State Revolving Loan Fund (SRF) authorizations to ensure the continuation of a strong federal-state-local partnership that addresses important clean water needs.
- The revision of the SRF allocation formula to ensure that federal SRF funding is provided to states based on population growth needs, in addition to other important criteria, that ensures equitable distribution of federal assistance.
- The identification of new priorities for point source SRF funding based on watershed planning, including pollution prevention projects like wastewater reclamation.

Watershed Management and the Importance of Addressing Site Specific Concerns to Provide Maximum Environmental Benefits

Enhancement of water quality and water resources to meet national goals through the end of the decade requires a policy and programs that differ from those of past decades. In the 1970s, national efforts focused on controlling conventional pollutants through the application of technology-based standards on point sources of discharges. As a result, we have benefited from major improvements in the quality of wastewater discharged from publicly owned treatment works (POTWs) and direct dischargers that has significantly improved the quality of our nation's lakes, rivers, streams and coastal waters.

Testimony of California Association of Sanitation Agencies  
April 1, 1993  
Page 2

During the 1980's, water pollution policy shifted from controlling conventional pollutants to controlling toxic pollutants. Once again, this policy shift targeted point sources. It began with EPA developing pretreatment standards that direct and indirect discharging industries were required to meet. National pretreatment standards were supplemented by local limits for toxic pollutants imposed by POTWs on indirect discharging industries in an effort to ensure the integrity of the POTW as well as the receiving waters. For the most part, these standards were technology-based controls. Reporting data illustrate that these controls were very successful in reducing toxic pollutants discharged from point sources.

The Federal Water Pollution Control Act of 1987 heralded a significant change in water pollution control mandates. It moved away from a technology-based approach to a water quality-based control policy. The 1987 Act required states to adopt water quality standards for receiving waters that would further ratchet down on toxic pollutant discharges. Known as the "command and control" approach, the 1987 Act provides no flexibility to address region-specific water quality problems.

CASA believes that a national approach that directs states to implement innovative solutions to site-specific water quality problems is needed. Such an approach would address all pollution contributors--not just point sources. This is especially relevant to the standard-setting process. More than five years since the 1987 Act was passed, a number of states still do not have EPA-approved water quality standards. California is one of these states. CASA urges that current law should be changed to address the problems inherent in developing effective and relevant toxic pollutant standards by:

- Requiring regular, independent peer review of national water quality criteria to ensure their applicability and technical and scientific relevance.
- Providing states with primacy to develop and implement standards that provide for the highest beneficial use and environmental quality that is reasonably attainable. Water quality standards should reflect the use and value of each water body, taking into account site-specific characteristics. The technological capability and risk reduction benefits of achieving a given level of environmental quality must also be considered.
- Giving states explicit authority to develop innovative water quality-based permit requirements on a watershed basis that recognize the multi-source nature of pollution (point, nonpoint and atmospheric) and the cross-media impacts that may result from controls.

In general, standards should be based on empirical site-specific studies and monitoring to guarantee that all water pollution mandates are relevant and provide a reasonable benefit for the costs incurred. During these times of limited public and private resources, nothing less will meet the challenge of doing more with less. The stakes are high. As a recent series of articles in the *New York Times* illustrates, policymaking on the basis of public perception, instead of sound science, is costly and can lead to greater environmental and human health threats. Significant improvement in water quality

Testimony of California Association of Sanitation Agencies  
 April 1, 1993  
 Page 3

will only occur through a rigorous, risk-based analysis that leads to setting clean water priorities within each watershed.

A watershed management approach is the preferred alternative for several important reasons:

- It will permit water pollution threats to be considered on a region-wide basis instead of on an artificial jurisdiction or point source basis.
- It offers the opportunity for all interested parties to work in a collegial manner to identify priorities and develop relevant and appropriate responses to pollution sources, thereby minimizing noncompliance because of disputes over recommended standards.
- It offers the chance for public efforts that will target real threats. For example, in California, and we suspect elsewhere, statewide water quality plans require significant expenditures of public funds, yet water quality objectives will not be achieved. This is the case because of the fact that the so-called plans are not plans at all. They are actually lists of numerical water quality standards without an accompanying implementation strategy. The standards were adopted in the face of EPA deadlines without regard to attainability.

During the past two years, CASA has worked with a number of groups to seek a consensus on the importance of developing a watershed management approach to achieve clean water mandates. More than one thousand people from all walks of life attended last week's national conference on watershed management "Watershed '93", attesting to the broad-based agreement that a holistic approach to water quality improvement must replace the current command and control approach. While differences may arise on how best to design a watershed management program, it seems clear that most interested parties would agree that it makes no sense to require compliance with numeric standards (or effluent limits in permits) until all pollution sources are addressed in a coherent plan.

We urge you and your colleagues to re-examine the fundamental underpinnings of clean water policy to ensure that control of water pollution is mandated in a manner that recognizes the complicated nature of water resources protection.

The ongoing efforts to address toxics in the San Francisco Bay area provide a good example of how the existing "command and control" approach fails the public need for clean water. Since 1960, San Francisco Bay area POTWs have spent more than \$3 billion to upgrade wastewater treatment systems. These improvements have resulted in 95% removal of conventional pollutants. Pretreatment programs and local limits have further reduced toxic discharges. Today, POTWs and industrial dischargers contribute less than 15% of the total metals discharged to the Bay. Despite these small loadings, the City of Palo Alto will need to spend more than \$100 million to build lime treatment and reverse osmosis facilities to remove metals in the 23 million gallon per day (MGD) to meet State water quality standards. Annual operating costs for these facilities are estimated at \$21 million. This tremendous capital investment would result in an annual reduction of 202 pounds of copper in the plant's wastewater discharge. Looked at another way, this represents a 0.0002%

## Testimony of California Association of Sanitation Agencies

April 1, 1993

Page 4

reduction in the 600 tons of copper that enter the Bay each year.

Other Bay Area POTWs estimate that costs to comply with water quality-based metals limits requiring similar treatment technology will come to \$1 million per day for each 1 MGD of treated wastewater, or as much as \$1.1 billion per year. This problem is not unique to California. Other communities face similar control requirements.

These examples illustrate the substantial costs local communities will incur to meet permit limits derived from EPA water quality criteria, regardless of the net effect on receiving water quality. CASA agencies have always accepted the responsibility to implement such standards but only when justified by environmental gains and water quality improvement. The current mandates do not pass this test. Perhaps more important, the mandates would not, if implemented, provide the intended benefit to the overall Bay Area water quality and the related habitat.

For example, California's State Water Resources Control Board has estimated that POTWs and other point source dischargers contribute less than 3% of the total pollutant loadings to the Bay. Alternatively, riverine, urban, and non urban run-off contribute approximately 16%, 58%, and 19% respectively. If all industrial and municipal dischargers achieved the goal of "zero discharge" this would result in a less than 310 ton reduction out of total annual pollutant loadings of 9,600 tons.

If we continue to target minor contributors, we will create serious secondary threats in addition to ignoring the real water pollution threats. Additional POTW control requirements such as lime and reverse osmosis treatments will result in creation of substantial quantities of lime sludge and brine that must be disposed. One California POTW, San Jose/Santa Clara, would produce 450 tons of additional sludge from 125 MGD of treated wastewater per day. At a time of diminishing land disposal capacity and concern that we redouble pollution prevention activities, we question the logic of requiring treatment that will provide negligible water quality improvement and exacerbate the landfill disposal capacity crisis.

These examples demonstrate the importance of targeting comprehensive watershed control efforts using risk-based priorities. Water quality in San Francisco Bay will not be served by requiring traditional point source discharges to augment their wastewater treatment capabilities with expensive new technologies. If we redirect our energies to monitor and control pollutant loadings from nonpoint sources, in addition to traditional point sources, our national effort to protect and enhance water quality will return greater benefits. However, nonpoint source pollution does not easily lend itself to control through national standards. The control of pollutant loadings from sources such as combined sewer overflows (CSOs), stormwater discharges and non-urban runoff must be implemented as part of a comprehensive watershed approach. The physical, chemical and toxicological nature of such discharges is highly site- and discharge-specific. The unique character of these discharges relates to variations in population size and density, geology, topography, and land use, as well as the flow characteristics and design of the collection system.

**Testimony of California Association of Sanitation Agencies**

April 1, 1993

Page 5

In areas of California and the arid west, POTWs will be required to incorporate new and very costly technologies to treat wastewater discharged into water bodies composed wholly or substantially of wastewater effluent. Applying nationwide or statewide water quality standards to these effluent-dependent streams will result in tremendous public expenditure without a commensurate environmental benefit to the community.

For example, it will cost a single POTW discharging into the Santa Ana River in Southern California \$110 million to remove ammonia from its effluent. This additional treatment will result in a 73% increase in the local community's wastewater rates. Curiously, this removal effort is intended to protect the estimated 2,600 adult mosquito fish that are planted for mosquito larvae abatement in the 8 to 10 mile river segment below dischargers. Keeping in mind that there are no native fish in the river because of the physical limitations of the habitat, the question must be asked; what does this treatment cost mean to the average ratepayer? Simply, the cost to remove ammonia is estimated at \$37,000 per fish or about \$19 million per pound of fish.

This cost is clearly out of line. The alternative to this advanced treatment is for the discharger to divert the wastewater to pipeline for conveyance to other downstream users for additional treatment or pipe it directly into the ocean and not discharge it into the river. This would deprive the river, normally a dry river bed, of its only water source, eliminating the mosquito fish's habitat. Watershed management, if applied to this situation, could address this important balancing consideration.

Other examples of inappropriate application of federal water quality criteria include sewage evaporation ponds, agricultural drains, and stormwater collection channels. EPA Region 9 has stated that these are "waters" of the United States and furthermore should be designated as fishable and swimmable. EPA Region 9 has also stated flatly that economics cannot be considered in setting water quality criteria.

CASA believes that this is not what Congress intended when it passed the Clean Water Act. We hope that Congress will clarify its intent on these issues and direct that watershed management is the appropriate mechanism to address such environmental matters.

The above circumstances are only a selection of examples that exist throughout California. For years, California has been in the vanguard of clean water policy development and implementation. CASA is proud of this. Today, however, we fear that we are experiencing the implementation of clean water policy that is unconnected with the available resources. Therefore, seizing upon our leadership role of the past, CASA proposes a series of specifics to serve as the basis of a watershed management policy.

**Specifications for Watershed Management Plans to Achieve Water Quality Goals and Objectives**

A number of legislative options have been drafted over the past year to address the deficiencies of the current water quality-based approach to improvement. CASA has worked on many of these efforts and supports their intent to redefine how the country establishes its clean water priorities.

Testimony of California Association of Sanitation Agencies  
April 1, 1993  
Page 6

CASA acknowledges that policymaking is an iterative process. Therefore, I would like to identify some key guidelines or principles that CASA hopes the Subcommittee will follow as it considers a watershed management policy:

1. Watershed Management Objective:

Develop a feasible and cost-effective program to achieve water quality standards throughout the watersheds of a state. These planning programs would be initiated in all watersheds where water quality standards are not being met.

2. Program Timing:

Watershed management planning would be completed within 5 years of the time resources are committed to begin the planning process.

3. Interim Clean Water Regulatory Policy:

Until watershed management planning is completed and appropriate and relevant water quality-based effluent limits have been developed, Congress must declare that it is the general policy to defer imposing water quality-based effluent limits into waste discharge requirements.

4. Preventing Continuing Violations of Water Quality Standards:

Pending implementation of a watershed management program, a state or EPA could require a discharger contributing to a violation of water quality standards to implement source reduction programs that reduce pollutants to the maximum extent practicable.

5. Watershed Management Planning Program Elements:

Any watershed management program should include, at a minimum, the following elements to ensure that equitable and comprehensive mandates are developed.

- A. Review of Pollutants--Based on existing information, identify those pollutants in each watershed that may be interfering with the attainment of current water quality standards.
- B. Survey of Pollutant Sources--Based on existing information, identify all significant point and nonpoint pollutant sources that may be contributing to violation of water quality standards.
- C. Monitoring--Based on the information obtained from the review of pollutants and the survey of sources, a multi-year monitoring program would be designed and implemented to characterize existing conditions and the significant sources of

Testimony of California Association of Sanitation Agencies  
April 1, 1993  
Page 7

pollutants. This characterization would provide information on water column concentrations, sediment conditions, habitat, and biological resources to assess the degree to which beneficial uses are impaired and water quality standards are attained. This characterization of pollutant sources is to include adequate information to determine the effect of sources of pollutants on water quality and sediment conditions.

- D. Identification of Problems--Based on monitoring programs and the most accurate methods available for assessing compliance, waterbodies would be identified that are in noncompliance and to which standards are violated.
- E. Site-Specific Water Quality Standards--For each waterbody found to be in noncompliance, development of site-specific water quality standards would be initiated. Such a plan would comply with the Clean Water Act and applicable state law.
- F. Wasteload Allocation--For each waterbody for which a water quality objective is not achieved, a state or EPA would establish a total maximum daily load (TMDL), a wasteload allocation (WLA) for point sources, and a load allocation (LA) for nonpoint sources. These limitations will be achieved throughout the waterbody. In major, complex watersheds, predictive models are to be relied on when setting wasteload allocations. WLA's and LA's should be based on a consideration of alternative control technologies available for each significant pollutant source contributing to the violation, economic and social effects, and cross-media environmental impacts. They shall be derived so as to ensure that cost to the public will be the lowest net cost without detriment to the environment.
- G. Watershed Program Implementation--The program would require compliance with agreed-upon measures within ten years from the date of a plan's adoption and include a schedule with important milestones to ensure timely implementation and compliance. The implementation plan must be feasible, taking into account institutional, technological, financial, regulatory, and socioeconomic constraints. The implementation plan must include a description of additional treatment facilities and controls and the costs to each source or category of sources that are required to meet standards.

As I noted, these are only suggested principles by which Congress can develop sound public policy that will address all sources of pollution in a watershed within a reasonable timeframe, consistent with current Clean Water Act requirements.

Watershed management addresses the technical issues behind our efforts to restore the ecosystem. Funding ongoing clean water mandates to ensure adequate wastewater treatment and pollution prevention initiatives is no less important.

Testimony of California Association of Sanitation Agencies  
April 1, 1993  
Page 8

### Funding Clean Water Facilities

Since the 1987 amendments, Congress has funded construction assistance for wastewater treatment facilities through the State Revolving Loan Fund (SRF) program. CASA supported this transition from the traditional grants program during debate on the 1987 Act. It was our hope that a strong commitment to the SRF program would be realized. With President Clinton's support of an additional \$845 million in SRF assistance in 1993, the SRF program authorization will have been met. However, meeting statutory obligations and actual needs are two different matters.

CASA has testified a number of times before this Subcommittee on the importance of funding California's and the nation's clean water infrastructure needs. California's funding needs are conservatively set at \$5 billion and estimates of total need beyond the decade far exceed this figure. Nationwide funding needs exceed \$110 billion. Continued federal support of the SRF program is critical for two primary reasons. First, it creates jobs both in the short-term through construction of facilities and in the long-term by providing the capability to accommodate residential, commercial and industrial growth, strengthening the local, state and federal tax bases. Second, the construction of these facilities directly benefits the environment by restoring habitat and preserving gains made in the past. Therefore, CASA strongly urges the Subcommittee to continue the SRF program and expand both funding levels and eligible uses of funds.

Recently, some groups have advocated a return to the traditional grants program. CASA maintains its support for the SRF, especially in light of what appears to be an unending string of austere federal budgets. However, our experience leads us to conclude that some special treatment should be considered for small communities and disadvantaged areas that are unable to shoulder the financial burdens imposed by the SRF program. Ignoring these real obstacles will only devalue investments made elsewhere. Therefore, CASA urges the Subcommittee to develop provisions that would permit direct grant assistance to small, disadvantaged communities which would otherwise be unable to secure SRF funding.

The Administration's preliminary economic plan identifies its intention to create a new SRF program in 1995. This is based on the concept that the current program expires in 1994. On April 5, we will learn more about the coming year when the Administration releases its budget revisions for 1994. The Administration proposes to provide \$2 billion per year to the SRF through 1997. CASA believes this commitment is a good start. Nonetheless, we take exception to this funding level and believe that a minimum of \$5 billion per year should be made available. This would be a return to historical funding levels. If we as a nation are requiring compliance with increasingly stringent federal water pollution standards, then the federal government has an equal responsibility to assist us in meeting these mandates. Only through a reasonable funding program can this be realized.

Testimony of California Association of Sanitation Agencies

April 1, 1993

Page 9

In addition to providing adequate federal assistance, CASA also recommends that the Subcommittee take the following steps:

- Specifically authorize SRF funding to support priority pollution prevention projects such as wastewater reclamation.
- Revise the federal allocation formula used to allocate assistance to the states. Any formula must take into account population growth in addition to water quality needs.
- Clarify that point source pollution control construction assistance continues to be the priority unless a watershed management plan containing mutually acceptable alternatives such as estuarine protection, nonpoint sources abatement, or other activities is adopted.

As you contemplate revisions to the SRF program, CASA encourages you to consider assigning new priorities for use of these funds. In the past, SRF assistance has been targeted to support compliance with secondary treatment needs. As these needs are met, Congress should consider how to best redirect available assistance. A key criterion should be pollution prevention. Future SRF assistance should support projects that meet this standard. One of the most promising pollution prevention programs involves wastewater reclamation. In California, wastewater reclamation projects are being designed to meet the growing demands of increasing State population. Wastewater reclamation projects help to relieve this pressure and provide environmental benefit by reusing treated wastewater, minimizing the need to draw down already limited water supplies needed to support environmental habitat.

Finally, CASA would like to address the Administration's proposal to create a drinking water SRF program that would assist municipal compliance with Safe Drinking Water Act requirements. Many CASA agencies perform dual services, providing wastewater treatment and drinking water supply. We therefore appreciate the Administration's acknowledgment that compliance with drinking water technology mandates can be especially burdensome. Federal assistance to drinking water suppliers would mark a milestone in the federal-local partnership which is long overdue. CASA supports the Administration's commitment in this area.

Nonetheless, we are deeply concerned that we avoid the trap of robbing Paul to pay Peter. Any drinking water SRF program must stand on its own merits. Limiting wastewater SRF funding would devastate the progress made to date. Therefore, while we encourage this new federal partnership, we hope that its funding will be secured without sacrifices from the wastewater community. As I noted earlier, California alone has more than \$5 billion in wastewater construction needs that are eligible for federal SRF assistance.

Mr. Chairman, there are number of other clean water issues that concern CASA, including retention of the domestic sewage exclusion, requirements to control stormwater and CSO's through costly technology-based standards, and limits to interstate transport of solid waste that could inadvertently include sewage sludge, which is stringently regulated under the Clean Water Act. CASA looks

Testimony of California Association of Sanitation Agencies  
April 1, 1993  
Page 10

forward to working with you and the Committee to ensure that renewal of the Clean Water Act also addresses these important issues.

Mr. Chairman, this concludes my testimony. I would be pleased to answer any questions you or your colleagues may have. Again, CASA appreciates the opportunity you have extended us to participate in this important endeavor.

**REAUTHORIZATION OF THE FEDERAL WATER POLLUTION  
CONTROL ACT**

**APRIL 1, 1993**

Chairman Applegate and distinguished members of the Subcommittee on Water Resources of the House Committee on Public Works and Transportation. I am Adrian Freund, Director of the Louisville-Jefferson County Department of Planning and Environmental Management in Louisville, Kentucky. Prior to assuming my present position in July 1992, I served as Chief of Water Management for the Connecticut Department of Environmental Protection. I have 21 years of experience in urban and regional planning, environmental planning and environmental management, with a concentration in water quality management. I hold a Bachelor's degree in Urban and Regional Planning from the University of Illinois.

On behalf of the American Planning Association (APA), I am here today to present the Association's views on reauthorization of the Clean Water Act. I respectfully request that the complete text of my statement be included in the official hearing record.

APA is a national public interest and professional organization consisting of public and private planners, elected and appointed officials at all levels of government, as well as educators, students and interested citizens. Our 28,000 members belong to 45 chapters covering every state and Congressional district.

APA was formed in 1978 when the American Institute of Planners, established in 1917, and the American Society of Planning Officials, founded in 1934, were consolidated. The Association's primary objective is to advance the art and science of planning for the improved development of the nation and its communities, states and regions, as well as to preserve its valuable natural resources. Within APA is the American Institute of Certified Planners (AICP) which focuses on professional

development.

The American Planning Association and its 28,000 members have a great interest in the wise protection of our nation's water resources. Our testimony is based, in part, on APA's adopted policy on Environmental Quality. APA has also developed policies on: Comprehensive Surface Water Management, Groundwater Quality and Quantity Protection; and Wetlands. APA's policy on Environmental Quality seeks to achieve:

- **the conservation of non-renewable resources – such as mineral, petroleum and agricultural lands – and the protection of renewable natural resources, such as surface and groundwater, air, topsoil, forests, and fisheries from further degradation or destruction.**
- **the integration of environmental protection and environmental policies and programs into comprehensive and functional planning and implementation programs at all levels of government throughout the nation.**
- **special protection for sensitive areas: wetlands; floodplains; areas supporting unique or endangered plant and animal species; sites of special scenic, historical, and archaeological significance; and lands or waters that would lose their value or be permanently impaired by human changes.**

Specifically, in relation to water, APA's adopted policies include the following provisions:

**1. Areawide planning and implementation of water quality management and water supply are critical.** Federal funds should be provided to regularly update areawide plans. Because waters are not confined by local, state, or national boundaries, purely

local efforts to improve water quality and/or supply are ineffective.

**2. Federal funding for the construction and upgrading of publicly owned wastewater treatment plants must be continued.** Publicly owned plants often support new growth and development and their construction provides jobs. Unlike scattered, private wastewater plants, public facilities often reinforce centralized growth and infill and prevent urban sprawl and water quality degradation. Furthermore, Federal construction funds should be consistent with areawide water quality plans which stipulate that any new growth and development to be served is necessary and environmentally sensitive.

**3. Data collection and analysis of existing conditions should be supported by federal funds.** There can be no sound decision on how to maintain and enhance water quality and supply without adequate data collection and analysis. Locally funded monitoring programs fail due to competition for scarce resources.

**4. Federal funds should be available to small and financially-strapped communities to avoid geographic inequities and to prevent economic hardship.** Areas of the nation with exceptionally sensitive bodies of water, large concentrations of waste-producing industry, or large low-income populations should not suffer diminished environmental quality because of an inability to pay.

**5. Research on the effects and magnitude of nonpoint source pollution and the effectiveness of control strategies should be continued.** The Section 319 program should be expanded beyond demonstration. Integrated watershed planning approaches to point and nonpoint source control should be promoted. Proposed projects and land use

activities should be evaluated for their contribution to nonpoint source pollution; and efforts to minimize adverse effects should be encouraged.

### A Planning Perspective on the Clean Water Act

Two years ago, the American Planning Association came before your Subcommittee to present a planning perspective on the Clean Water Act reauthorization. In our testimony, we stressed four basic premises that underlie our positions on the Clean Water Act and our adopted policies on water management. Those premises, equally valid today, are:

**1. Water quality is fundamentally related to land use and land management.**

The business of planners and planning is to apply foresight to the way land is used and managed. Increasingly, environmental protection is an integral part of the process of developing comprehensive plans at all levels of government. Our communities' use of land directly impacts water quality. Some impacts come from point sources while others come from broadly dispersed or "nonpoint" sources. Land use planning is undertaken by nearly all units of government and used to establish the basis for zoning and development regulations. Increasingly, infrastructure investments in wastewater facilities are used as a tool to help shape and guide urban growth and reduce the negative impacts of urbanization on water quality.

**2. Efforts to clean up polluted water require extensive capital investments.**

Long-range capital planning of at least five to six years is needed at every level of government. Stable funding of infrastructure programs at the federal level is essential to

secure large and stable capital commitments from state and local governments.

The benefits of local and regional clean water accrue to the nation as a whole. Financing of water management facilities and programs is a federal as well as local and state responsibility. The state revolving fund (SRF) program has been highly successful in stimulating the construction of new facilities to attack water pollution. Without the SRF, state and local governments could not afford to make the massive investments required to achieve water quality standards. The 1987 Clean Water Act Amendments introduced nonpoint sources, combined sewer overflows, sludge management, stormwater and toxics as new needs to be addressed by the states. Addressing these problems will require large new capital investments throughout the next two decades. Stable federal funding is essential.

**3. Water quality and water quantity are directly interrelated. Water quality is irrevocably tied to the amount of clean water available for drinking, industrial and agricultural uses.**

Polluted water is not readily available for drinking and must often be subjected to costly treatment processes to make it suitable even for industrial and other uses. Since surface and groundwater are closely interrelated, the quality and quantity of groundwater can directly impact surface water as springs feed the streams and rivers, especially in time of drought. Surface and groundwater withdrawals for consumptive use reduce flows in rivers and streams and may seriously compromise the achievement of aquatic life and recreational use goals in large areas of the nation.

**4. Wetlands in their natural state perform ecological functions that are impossible or**

costly to replace and are vitally important to the environment and economic health of the nation.

Wetlands protect the quality of surface waters by retarding the erosive forces of moving water, and by intercepting and reducing waterborne sediments, excess nutrients, heavy metals and other pollutants. Several states in our nation have developed outstanding wetland protection programs that recognize the critical functions that wetlands play in maintaining water quality and providing habitat for wetland dependent and transitional plant and animal species. Wetlands protection is a fundamental land use management function in which the federal government must provide leadership. State and local governments must play supporting roles.

Last year, APA came before this Subcommittee to testify on the merits of H.R. 5070, the "DeLauro-Lowey Water Pollution Control and Estuary Restoration Financing Act." In our testimony, we noted that the outstanding work of your esteemed colleagues offered an opportunity to better integrate planning and development decisions at an ecosystem or "bioregional" level. Commenting on the work of Representatives DeLauro and Lowey in a recent letter to APA, Majority Whip David E. Bonior noted that the "Congresswomen...recognized early that careful planning can help to maximize the environmental and economic benefits of expenditures on environmental infrastructure." Congressman Bonior, commenting on Congresswomen DeLauro and Lowey's recent efforts to develop a strategy for expediting infrastructure funding, notes that the proposal "will focus on giving priority to projects that emerge from sound planning

efforts."

President Clinton's budget contains a major economic stimulus package that focuses on infrastructure investments as a way to create jobs, promote economic development and meet environmental goals. Those projects that are "ready to go" under the administration's program will undoubtedly be the same projects that have benefited from careful planning.

### The Merits of a Watershed Planning Approach

There are many signs that the benefits of sound planning are becoming more widely recognized. The National Estuary Program requires "Comprehensive Conservation and Management Plans" as a basis for making decisions about investments and regulatory programs that are needed to clean up waters of special national significance. Under Section 319 of the Clean Water Act, states create nonpoint source management plans to establish priorities for investments in best management practices, land management programs and land use initiatives. Wastewater facilities plans have been part of the clean water vocabulary since the 1970's.

Throughout America, hundreds of watersheds provide examples of the application of planning approaches to watershed and water quality management. I have developed watershed programs in places as diverse as Austin, Texas; Madison, Wisconsin and the State of Connecticut. In my own area of Louisville and Jefferson County, Kentucky, a unique and sensitive watershed known as Floyds Fork has been protected from the pressures of urbanization. The Floyds Fork Program was led by David Armstrong,

County Judge/Executive and uses zoning and development standards and policies to protect the character of the watershed and prevent water quality degradation.

In 1991, the State of North Carolina's developed a Whole Basin Approach to Water Quality Management. Throughout 1991 and 1992, state water managers, water interest groups, APA and several federal agencies began to focus upon the concept of a watershed basis or basin approach to water quality management as a new organizing framework for the Clean Water Act. Last week, over 900 persons participated in an EPA conference on the subject of watershed planning and management. Sound, integrated planning of ecosystems or "bioregions" is at the heart of the watershed approach.

The American Planning Association has developed a conceptual framework for a watershed approach to clean water (copy attached) and strongly supports the concept as an effective tool to coordinate and integrate the many programs required by the Clean Water Act. National Pollutant Discharge Elimination Systems (NPDES) permitting, monitoring, water quality modeling, nonpoint source assessment, waste load allocation, best management practices and planning requirements can be integrated throughout a watershed. Water quality and aquatic resources can be assessed simultaneously throughout an entire river basin.

The benefits of whole basin or watershed planning and management fall into three major categories: (1) improved program efficiency, (2) increased clean water program effectiveness, and (3) consistency and equitability. By focusing on specific areas of concern each year, monitoring, modeling, and permitting efforts can be focused; as a

result, more can be achieved for a given level of funding and resource allocation. The whole basin approach is consistent with basic ecological principles of watershed management, leading to more effective water quality assessment and management. Linkages between aquatic and terrestrial systems are addressed (e.g., contributions from nonpoint sources) and all inputs to aquatic systems, and potential interactive effects are considered.

Watershed management will facilitate the incorporation of nonpoint source pollution assessment and controls, since these diffuse pollutant sources extend to the watershed boundaries and accumulate from a basin's headwaters to its mouth. Watershed plans will provide a focus for management decisions. By clearly defining long-term goals and approaches, these plans will encourage consistent decision-making. Consistency, together with greater attention to long-range planning, in turn will promote a more equitable distribution of the assimilative capacity of a water body, explicitly addressing the trade-offs among pollutant sources (point and nonpoint) and allowances for future growth.

North Carolina is but one of many states that are exploring or have implemented watershed-based water quality management programs. Currently, many of the Clean Water Act requirements for reporting and planning can be satisfied through a whole basin or watershed management approach. **Some of the Clean Water Act requirements that could be more effectively addressed through a whole basin approach include:**

- Section 302 -- Water Quality based effluent limits. Under a watershed approach, alternative effluent control strategies could include approaches

such as assimilative capacity "banking."

- Section 304(1) -- Impaired Waters. A watershed approach would include a comprehensive analysis of all the inputs to a watershed that may cause degradation. More objective priority setting and improved management strategies are the benefits.
- Section 305(b) -- Water Quality Inventory. A comprehensive assessment of water quality in each watershed is generated through a whole basin approach.

Sections 201, 303 and 319 of the Clean Water Act require or strongly encourage a watershed approach to water quality management. However, a piecemeal approach to implementation of the Act, a fragmented approach to funding and grants and a variety of separate reporting requirements have discouraged states and localities from pursuing integrated watershed-wide approaches.

It is the position of the American Planning Association that barriers to carrying out watershed-based planning should be identified by Congress and removed during the reauthorization process.

#### Additional Recommendations for the Reauthorization

The American Planning Association has developed several additional recommendations for the reauthorization.

1. The planning process for controlling nonpoint source pollution needs to be improved.

We recommend consistency between local land use plans and state water quality plans including nonpoint source reduction. The federal nonpoint source program must shift its emphasis from demonstration to long term management of nonpoint sources.

The Clean Water Act should require that localities receiving or qualifying for federal assistance establish a nonpoint source management strategy. The statewide (Section 319) nonpoint source plans should reflect participation by regional planning agencies and local government in nonpoint source planning. The Act should either set forth in detail the criteria that the Environmental Protection Agency (EPA) must use in certifying that a state plan is adequate, or require EPA to promulgate regulations setting forth such detailed criteria. The program could follow the model established by the requirement for a coastal area water quality element in the Coastal Zone Management Act.

States should require regional agencies and local governments to certify that their existing plans are consistent with state nonpoint source management plans, or require regional and local governments to prepare and implement new nonpoint source management plans consistent with the state plan. States should certify to EPA that they have reviewed both regional and local plans and found them consistent with state plans. Consistency of federal projects should be required before capital improvement funds are released for major federal facilities, including federally assisted highway projects.

Congress should appropriate sufficient funds to allow EPA, states, and local governments to successfully administer the nonpoint source control program. Such administration should go beyond the current situation to anticipate meeting future needs.

Grants are also needed so the states and local governments can prepare and implement high quality nonpoint source reduction plans. The Section 319 nonpoint source program should emphasize institutionalizing nonpoint source control, as contrasted with the current focus on demonstration.

2. We support providing opportunities for joint management of ground and surface water supplies and believe that state water plans that address surface and groundwater quality and quantity should be required.

Federal grants are needed to fund research on strategies for joint management of ground and surface water that also integrate principles from the Safe Drinking Water Act. We need to start looking at the resource on an ecosystem basis.

The Clean Water Act should take first steps toward requiring state water plans that address surface and groundwater quality and quantity. The plans should provide for in-stream flow quality and quantity standards for the purpose of preserving and enhancing fish and aquatic life. The revised Act should also contain special provisions for ephemeral and intermittent watercourses with standards appropriately based on the sources of water.

Federal funding for any water project should be approved only when state water plans can demonstrate consistency with other state planning programs such as growth management, clean air and solid waste management. Local wastewater facility plans submitted to the state for funding under the state revolving fund must be consistent with local air, water, solid waste management and growth management plans (where they exist). Local land use planning needs to take into account water quality and quantity.

The plans should guide development to be compatible with protection of recharge areas, conservation of aquatic habitats, surface water quality, stormwater runoff and take into account cumulative and synergistic effects.

**3. The federal government should establish a long-range capital planning budget, at least five to six years in scope, as a basis for appropriating funds to the State Revolving Fund (SRF) for building and upgrading the many public works projects necessary to achieve the objectives of the Clean Water Act.** For communities in economic hardship, additional SRF funds should be made available and payback periods should be extended.

The large unmet need for construction and upgrading of wastewater treatment plants requires additional investment by the federal government in the state revolving fund (SRF). The SRFs must also address new needs such as combined sewer correction, stormwater, nonpoint sources and sludge management. The federal government should give special consideration to assistance for public works projects that are included in adopted local and state capital improvement programs of state and local governments that are linked to longer-term state development plans and local comprehensive plans.

**4. The State Revolving Fund (SRF) program should be continued at least through 1999, with federal capitalization funds of at least \$2 billion annually.** Additional funding comprising a total of \$5 billion annually should be provided as part of an economic stimulus program targeted at infrastructure. The continuation of funding should address the unmet needs included in the 1987 Clean Water Amendments.

The 1987 Clean Water Act Amendments introduced nonpoint sources, combined sewer overflows, sludge management, stormwater and toxics as new capital needs to be

addressed by the states. Continuation of capitalization grant appropriations at the current level of approximately \$2 billion annually through 1999 will allow SRFs to address many of these unmet needs mandated by the 1987 Act. Additional funds should be appropriated and any program that also addresses drinking water needs should be funded at levels of up to \$5 billion.

5. A goal of no overall net-loss of the nation's remaining wetlands resource base as defined by acreage, volume, location, type and function should be adopted. Where feasible, federal legislation should support actions to enhance, restore and create wetlands using a "partnership" approach that incorporates private stewardship and federal, state, and local cooperation.

APA supports language in the new Clean Water Act to protect wetlands and to promote the development of EPA-assisted, funded and approved comprehensive wetland management plans at the state, regional and local levels. These plans must ensure intergovernmental coordination and achieve the no net-loss goal. That also means that federal activities must be consistent with EPA-approved state and local wetland management plans.

We recommend allowing and encouraging states, regional and local government entities to assume responsibility for specific portions of the Section 404 program and other future legislated programs so long as they demonstrate a capacity to further the national goal of no-net loss and adopt approved state wetlands management plans. Local governments should be allowed more direct participation in both the regulation and management of wetlands based upon a clearly defined wetlands inventory and

classification system.

We urge you to establish a comprehensive program that supports tax-based and other financial incentives to encourage landowners, land trusts, states, and local governments to protect wetlands, and provide funds for public and semi-public acquisition of wetlands in full or in part, as appropriate. Planning techniques such as cluster zoning and transfer of development rights and other innovative land use incentives need to be encouraged to accomplish the preservation of wetlands.

The Clean Water Act should encourage states and local governments to establish mitigation banks for unavoidable losses of wetlands. Federally funded projects, especially transportation facilities, including those funded by the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA), should be designed to avoid unnecessary wetland losses. Mitigation for unavoidable losses should be eligible for federal funds.

**6. To further the intergovernmental partnership that implements the Clean Water Act, we support adequate federal funding for the states and local governments to carry out and manage significant new mandates.**

States have a key role in the federal Clean Water strategy. States have carried out the basic requirements of the Act for nearly 20 years with considerable progress. Federal support of state program management, however, has dwindled in recent years, and states must now take on new responsibilities for stormwater permitting, nonpoint sources, toxics and other mandates of the 1987 Act.

The management needs of states are estimated to be at least \$700 million annually. Federal appropriations for Section 106 must be dramatically increased from

their current level. Local governments also need more money and support from the federal government so they can carry out their role under the Clean Water Act as well.

#### CONCLUSION

Let me conclude by thanking the Chairman for inviting the American Planning Association to testify before your Subcommittee, thus providing the planning profession an opportunity to share with the Subcommittee our thoughts and expertise on the Clean Water Act. I would also like to recognize the Government Affairs staff of APA here in Washington, D.C. for their fine efforts in focusing greater attention on the importance of sound planning. We believe that the Congress can substantially improve the Clean Water Act by integrating the planning approaches advocated by APA into the Act.

Other recent models, such as the Intermodal Surface Transportation Efficiency Act (ISTEA), demonstrate the merits of a participatory, integrated federal/state/local planning partnership.

I would be more than happy to address any questions you may have.

## **Watershed Basis for Clean Water**

**Prepared for the American Planning Association  
 By Margot W. Garcia, PhD, AICP  
 Department of Urban Studies and Planning  
 Virginia Commonwealth University**

**in consultation with Charles Wolfe and Keene Callahan of Robinson & Cole, Hartford, Connecticut and Arlan Colton, State Land Department, Tucson, Arizona.**

Despite massive efforts at point-source pollution control which has resulted in considerable improvement, the rivers and lakes of the United States still are not fishable and swimmable. Non-point source pollution from urban, agricultural and industrial runoff has become the greatest problem. The waterways and wetlands of our nation are an indispensable and irreplaceable but fragile natural resource with which the citizens of the nation have been endowed. These are an interrelated web of nature essential to an adequate supply of surface and groundwater; to hydrological stability and control of flooding and erosion; to the recharge and purification of groundwater; and to the existence of many forms of animal, aquatic and plant life.

The quality of our nation's water is a historical reflection of land uses which requires new and innovative solutions to address the problem. What follows is a conceptual model for watershed based planning and management to reach the nation's goal of the protection of the physical, biological and chemical integrity of our nation's waterways.

### **I. General Assumptions**

- We need to approach this problem from a "systems" point of view, meaning dealing with the complete hydrologic system of precipitation, surface and groundwater, wetlands, lakes and ponds, and estuaries. The systems approach forms one of the references for planning and management.
- The definition of "clean" needs to come from a risk-based analysis.
- With very few exceptions, land use decisions have been historically made at the local level with active and informed citizen participation. This process is strongly supported by citizens.
- Definition and analysis of problems and forecasting of trends needs to be based on the best science available. A basic inventory of ecosystem characteristics and functions is essential as well.
- Water quality and water quantity are interrelated. Upstream activities determine the limits within which downstream activities may be carried out. The quantity of water cannot be divorced from quality for purposes of beneficial use, and

Watershed Basis for Clean Water

quality is conditioned by the quantity available.

-- In order to adopt and implement this "systems" approach, all the parties who will be affected need to be at the table to agree on the definition of the problem and to negotiate the strategies to resolve the issues identified.

-- The Water Resources Planning Act of 1965 by creating a cooperative framework between the federal government, states, local governments and private enterprise established a Federal-State framework to manage and protect river basins. We need to build on that experience.

-- While there is a need to establish institutions based on watershed or ecological boundaries, creating new governmental structures should be avoided. One way to avoid creating new structures is to modify existing ones.

-- The existing point and nonpoint National Pollutant Discharge Elimination System (NPDES) permit system should stay in place. The Section 404 and 401 permits system of the Clean Water Act should be modified. Flexibility of these systems during transition to a watershed-based approach is necessary.

## II. A Conceptual Framework

The watershed systems approach provides the basis to (1) analyze water quality and quantity problems, (2) implement land use and environmental planning strategies to overcome these problems, and (3) monitor the progress and success of the watershed system approach in order to adjust the strategies as needed. To be effective and comprehensive, watershed boundaries would overlay existing political boundaries of states, counties and municipalities. These political jurisdictions within one watershed would need to work together under new institutional arrangements.

The watersheds systems approach is an attempt to achieve the goal of "fishable and swimable" under the Clean Water Act.

The U.S. Geological Survey (USGS) has a system for classifying watersheds as they aggregate into larger systems, which was used in part by the Water Resources Council (WRC). There are 21 river basins in the U.S. which would report to EPA. The "river basins" would form the largest regional areas. Planning and coordinating of watershed plans would occur at this level. They would also be responsible for setting water quality standards and administering the NPDES permit system in accordance with approved watershed plans.

**The next level of management or coordination of watershed activities would be**

Watershed Basis for Clean Water

"**planning subregions.**" This is an area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s) or a group of streams forming a coastal drainage area. The WRC had set up 222 of these planning subregions (later consolidated to 106 assessment subregions).

The "**accounting unit**" is nested within or equivalent to a planning subregion. It is used by the USGS for designing/managing the National Water Data network. The WRC had set up 352 accounting units. In a small riverine basin these might be equivalent to the planning subregions. This is the level that would be responsible for issuing Section 404 and 401 permits for development projects, making sure that the permit issuance is consistent with the metropolitan planning organization(MPO)/council of governments(COG)/hydroregion plan and its Best Management Practices (BMPs).

**Representing part or all of a surface drainage basin, a combination of drainage basins or a distinct hydrologic feature is the local hydroregion.** Called "cataloging unit" by the USGS, they have about 2100 of these areas and use them in acquiring and cataloging water data. In an effort not to create new layers of government, there should be an effort to use the MPOs or COGs in creating the local institution. One might need to adjust the boundaries of the MPOs or COGs to coincide with watershed boundaries. At this local level or MPO/COG/hydroregion is where the major planning and implementation of the strategies (including site-specific Best Management Practices) would occur.

Each watershed level river basin would have a citizen committee to guide the work and recommend policies. The committee would be made up of 20 percent industry representatives (including agricultural industry and agriculture), 20 percent environmentalists, 15 percent from the professional organizations, 15 percent academics, and 10 percent representing local governments, 10 percent from state government, and 10 percent from federal agencies. The actual size of the committee would depend on the size of the watershed and population of the area. The group would work by consensus and plenty of time to work through the issues would be allowed in building the plan. The membership of the MPO/COG/hydroregion citizen committee would be appointed by the MPO/COGs. The citizen committees for the unit and planning subregion would be made up of representatives from the MPO/COG/hydroregion citizen committee. The citizen committee for the riverine basin would be appointed by the governors of the states involved.

The local MPO/COG/hydroregion plan would be sent to the accounting unit group. That unit citizen committee would work to integrate the different plans coming from the local MPO/COG/hydroregion committees in their area. The unit citizen committee would negotiate with the local MPO/COG/hydroregion committees as well as among themselves to set consistent strategies to handle the identified problems and

### Watershed Basis for Clean Water

priorities for funding. The Unit plan would then be sent to the planning subregion citizen committee for similar action. Their plans would go to the riverine basin citizen committee for integration with the other planning subregion plans. The riverine citizen committee would negotiate with the planning subregion committees, as well as among themselves, to set consistent strategies to handle the identified problems and set priorities for funding. They would set the general policies and water quality standards that must be met for the entire riverine basin. The river basin plan must be approved by the U.S. Environmental Protection Agency.

Based on approved plans and priorities, budgets would be set and funding allocated for implementing the plans.

### III. The Watershed Plan

The goal of each local MPO/COG/hydroregion, accounting unit, planning subregion and riverine watershed plan is to protect the physical, chemical and biological integrity of the hydrologic system and to have all the waters of their watershed in fishable and swimmable condition.

A plan at the local MPO/COG/hydroregion must contain an inventory of the ecosystem, hydrologic system (lakes, ponds, springs, aquifers, streams, rivers, wetlands -- tidal and non-tidal -- and estuaries). Appropriate and defensible water quality standards will need to be developed based on the best scientific information available. The following topics need to be analyzed and strategies developed to overcome problems as defined in the plan:

- quality of surface and ground water
- quantity of surface and ground water
- assimilative capacity of streams and rivers in the area
- wastewater treatment facilities
- instream flow
- quality of drinking water
- flooding and floodplain management
- erosion and sedimentation
- reuse of treated effluent
- septic tank regulations
- dredging and dredged material disposal
- wetlands
- quality of bay, estuary and coastal waters
- drainage
- stormwater management.
- urban and rural runoff, including agricultural and animal waste

Watershed Basis for Clean Water

- comprehensive plans, zoning ordinances, and subdivision regulations
- transportation plans
- injection and dry wells

The plan also needs to deal with water demand from the following sectors:

- domestic and commercial
- manufacturing
- energy production
- mineral production and mining
- agriculture and ranching
- recreation
- navigation
- fish and wildlife
- natural areas, historic and wilderness areas

The plan must include an implementation plan which will put in place procedures to ensure that local governments are following the practices outlined in an approved plan and that violators be prosecuted. Incentives for local implementation may also be beneficial.

The plan also needs to develop monitoring criteria that will assess the effectiveness of the strategies (including site-specific BMPs) adopted to resolve the problems. The plan must mandate consistency of city/county comprehensive or master plans, zoning ordinances, subdivision regulations and riparian/wetlands regulations within the MPO/COG/hydroregion boundaries -- and therefore within the watershed.

The plan should be updated every five years.

Public workshops, education and hearings must be part of the planning process. Only through extensive public education and involvement, so that the consequences of everyone's individual and collective actions are understood, will there be progress in cleaning up our water resources and the environment in general.

There needs to be an appeal process from whatever regulatory measures are put in place. The appeal process should consist first of a hearing by a citizen board. If that does not result in satisfactory resolution of the dispute, then either party can request alternative dispute resolution -- the use of environmental mediation. If the mediation is unsuccessful, the use of the courts is appropriate. Legal proceedings should be disallowed until the first two steps have been completed.

#####

STATEMENT OF DOUG HARRISON  
on behalf of the  
CALIFORNIA STORMWATER QUALITY TASK FORCE

Before the Subcommittee on Water Resources  
Committee on Public Works and Transportation  
United States House of Representatives

April 1, 1993

INTRODUCTION

Mr. Chairman, members of the Committee, my name is Doug Harrison, and I am the General Manager of the Fresno Metropolitan Flood Control District in Fresno County, California. The District provides urban storm drainage, flood control and water conservation services to the metropolitan area of central Fresno County.

Today, I am appearing on behalf of the California Storm Water Quality Task Force (CSWQTF) for which I have served as Chairman from January, 1990 to December 1992 and which I now serve as Chairman of the Legislative Committee.

The California Stormwater Quality Task Force is a unique organization of some 500 parties representing municipalities, business, industry, regulatory agencies, and independent technical firms. The Task Force has been recognized by the California State Water Resource Control Board as its advisory unit on implementation of section 402(p) of the Clean Water Act and has led the development of the progressive stormwater quality compliance effort underway in our state.

Through the leadership of our Task Force, local agencies, together with our state regulatory bodies, have responded quickly and aggressively to implement the comprehensive stormwater quality program objectives set forth in the 1987 Water Quality Act. Seven of our largest metropolitan counties, containing in excess of 15 million people and dozens of cities, have been operating under regional stormwater NPDES permits since 1990. Through these permits, our state and its municipalities have been implementing a variety of comprehensive stormwater quality improvement programs.

Because of our early effort to implement the Congressional stormwater mandate, we have identified fatal flaws in the current legislative and regulatory framework. More positively, we have also identified the elements required for a successful stormwater quality program.

PROBLEMS WITH CURRENT STATUTE

The fatal flaws in the current legislative and regulatory mandate relating to stormwater quality include the following:

1. Unintended Performance Standard: While the Congress clearly intended the municipal performance standard to be a comprehensive program of "practices", "techniques" and "methods" to reduce the discharge of runoff borne pollutants to the "Maximum Extent Practicable" (MEP), EPA's general counsel has concluded municipal stormwater quality programs must never-the-less achieve numeric end-of-pipe water quality objectives.
2. Unnecessary Litigation: Confusion as to the intended performance standard (programs vs end-of-pipe water quality objectives) has resulted in costly law suits against regional stormwater NPDES permits where local agencies were implementing aggressive, state-of-the-art stormwater quality programs.
3. Unproductive Permit Application Costs: A nationwide survey by the National Association of Flood and Stormwater Management Agencies (NAFSMA) has determined the cost of the municipal Part I/Part II stormwater NPDES permit applications alone will equal or exceed \$140 million (an average of \$761,000 per community) - with none of the expenditure producing any improvement in stormwater quality.
4. Unconscionable Permit Program Costs: A nationwide survey conducted by the American Public Works Association (APWA), in coordination with the CSWQTF, determined the initial cost of the attempt by municipalities to achieve water quality objectives as currently expressed will total \$415 billion, and that continuing annual costs will total \$542 billion. The costs for the Sacramento metropolitan area alone, determined through an attainability analysis, totals \$2.0 billion.
5. Unachievable Standards: Extensive urban runoff quantity and quality research findings (including the attainability analysis performed by the City and County of Sacramento), indicate that even with such massive expenditures, municipalities will not be able to achieve consistent compliance with water quality objectives as currently expressed.
6. Inappropriate Compliance Measures: The variables which influence stormwater system flow and contaminant loading and concentrations, are so numerous and unpredictable, current monitoring technology is not sufficiently accurate to prove the beneficial impact of any particular practice, technique or method from one storm event to the next.

7. Unwarranted Penalties: Without the ability to accurately measure results, responsible communities pursuing extensive stormwater quality programs will be treated the same as irresponsible communities making little effort. In spite of massive efforts and expenditures, responsible communities will be found in non-compliance and subjected to the enforcement and penalty provisions of the statute.

NECESSARY STORMWATER AMENDMENTS TO CWA

Absent substantive amendments to the stormwater provisions of the CWA, local communities will be overwhelmed by the cost of pursuing an impossible regulatory standard and will find themselves in continuing unavoidable violation of their permit requirements. Such a regulatory program has no chance of achieving its declared objectives and can only collapse under the weight of an impossible compliance burden.

The legislation effecting reauthorization of the Clean Water Act must therefore recognize the following principles:

1. the physical, chemical and political character of stormwater is far different from all other forms of regulated discharges and requires a legislative and regulatory mandate reflective of that character;
2. the development of effective technologies and the raising of the necessary financing by the local communities will require a significant period of time; and,
3. the legislative and regulatory framework must establish a performance mandate which is technically and financially feasible and which is sufficiently measurable to ensure accountability and equitable enforcement.

Our Task Force has now developed specific draft language for your consideration. In drafting our proposal, we have conducted an open and active dialogue with the environmental community, municipalities, regulatory agencies, legislative bodies, business and industry and independent technical experts.'

The legislative language we present for your consideration attempts to address the major issues and objectives presented by each of those interests participating in our dialogue. More specifically, the proposal does the following:

1. Reaffirms and clarifies the MEP standard of performance and uses existing water quality objectives as the measurement of progress.

2. Reemphasizes the clearly expressed intention of Congress for stormwater quality management to be accomplished through comprehensive programs focused on pollution prevention as opposed to treatment.
3. Defines as an acceptable stormwater quality program, one which includes:
  - a. specific minimum control practices, techniques and methods; and,
  - b. the requirement to perform additional control practices, techniques and methods as determined necessary.
4. Requires annual program reporting and independent compliance audits as the measure of the communities' stormwater quality program effort and as the basis for the compliance enforcement actions provided in the act.
5. Requires that stormwater criteria and control practices be technically and financially feasible.

#### SPECIFIC PROVISIONS OF PROPOSED STORMWATER AMENDMENTS

Attached to this statement is the proposal of the California Stormwater Quality Task Force for amending the NPDES stormwater permitting provision [Section 402(p)] of the Clean Water Act. The form of the proposal submitted with this testimony includes the issues and points of compromise achieved through the efforts of the Task Force as of March 1993. To date the proposal's concepts have been endorsed by the American Public Works Association and the National Association of Flood and Stormwater Management Agencies. We are informed the proposal is also being actively considered by many other organizations and municipalities across the country.

The proposal includes the following specific provisions:

1. Incorporates the initial deadlines, permit applications and permits initiated pursuant to the 1987 CWA amendments and the related November 1990 regulations.
2. Creates a separate section of the Act [Section 402(q)] for municipal stormwater, this due to the major differences between the industrial and municipal stormwater performance mandates.
3. Extends the permit deadlines for Phase II discharges (e.g. small cities) until October 1, 1996 allowing time for EPA to complete required studies and new guidance documents.

4. Continues to require the prohibition of non-stormwater discharges into storm sewer systems and the removal of pollutants from stormwater discharges to the maximum extent practicable.
5. Requires development of technical guidance and protocols to insure development and implementation of effective comprehensive stormwater quality management programs and permits by the states and municipalities.
6. Requires development, by the states (or the Administrator in non-NPDES states), pursuant to specific EPA guidance and approval, of minimum mandatory stormwater quality management practices, control techniques and methods which must be incorporated into the municipal NPDES stormwater permits in the form of a comprehensive stormwater quality management program.
7. Requires such additional practices, control techniques and methods as are necessary to target specific stormwater borne pollutants impacting impaired receiving waters.
8. Requires studies to:
  - a. develop within 5 years, a specific methodology for establishing feasible stormwater criteria; and, the subsequent inclusion of such criteria in the stormwater quality management programs and permits.
  - b. evaluate the effectiveness of controls related to receiving water quality;
  - c. investigate the sources, and potential source control measures, for pollutants typically found in stormwater; including studies of sources and source reduction related to motorized vehicles.
9. Achieves compliance enforcement by:
  - a. Requiring continuing monitoring and assessment of the implementation and effectiveness of the practices, control techniques and methods;
  - b. the preparation of comprehensive annual reports of program performance, monitoring and assessment evaluations;
  - c. the use of independent external compliance audits; and,

- d. the use of established water quality objectives as the measure of program progress; and, the use of the program performance requirements in the permit as the tests of compliance and enforcement under the CWA.

10. The proposal further requires:

- a. the stormwater criteria, management practices, control techniques and methods to be technologically and financially feasible;
- b. the lists of practices, control techniques and methods be continually updated, to incorporate new technology or feasibility and to delete ineffective practices;
- c. public participation in the development of the municipal stormwater quality management programs; and,
- d. continuing operation and maintenance of the implemented practices, control techniques and methods.

CONCLUSION

It was our privilege to testify before this committee on this subject in April 1991. At that time we could only predict the problems we foresaw in the structure of the stormwater program. Today we can specifically define and quantify the problems with the current mandate. We can describe the dilemma this has created for local government; and, we can provide a specific proposal for a functional remedy.

The Problem Defined

Though clearly unintended, the stormwater quality mandate is now the achievement of existing end-of-pipe water quality objectives. Even with massive end-of-pipe treatment and in-system structural measures, the tremendous number of variables in stormwater flow and urban pollution make achievement of end-of-pipe objectives impossible for stormwater systems.

The Problem Quantified

The cost of preparing the municipal stormwater permit applications are averaging \$761,000 per community - \$140 million nationally. This expenditure, however, will only initiate the paperwork, it will not develop or implement any stormwater clean-up activity.

The initial capital costs nationwide to pursue stormwater compliance with existing water quality objectives will total \$415 billion dollars, and continuing annual stormwater program operations and maintenance costs will total \$542 billion per year. The City and County of Sacramento County alone would incur costs of \$2 billion in its attempt to achieve existing water quality objectives. Even with such massive expenditures, however, stormwater discharges cannot achieve existing water quality standards.

#### The Dilemma of Local Government

The costs of the total environmental mandate, and perhaps the cost of the stormwater mandate alone, exceeds the ability of local government to pay for it. The Cities of Columbus, Ohio and Anchorage, Alaska have calculated environmental programs compliance costs of \$1.6 billion and \$430,000 respectively, to be incurred prior to the year 2000. This represents estimated costs per capita ranging from \$1,200 to \$1,800, all to be funded from local revenues. The per capita costs in Sacramento for stormwater alone would total \$ 2,000.

Perhaps in no other single area are the stormwater quality issues faced by local government more clearly seen than in this area of costs and their impact on other public service needs. Decisions among alternative budget cuts -- trading parks and recreation for police and fire; planning and traffic for infrastructure; and more -- are before cities and counties at the same time they are told they must now spend dollars they don't have for a product (stormwater quality compliance) that can't be achieved.

In a recent briefing of the Chairman of our own local County Board of Supervisors to discuss a stormwater quality tax, the Chairman noted that before raising taxes for stormwater quality, we should consider that half of the County fire stations would be closing and the jail would be releasing prisoners due to tax revenue deficiencies.

#### The Functional Remedy

During two years of discussion with business and industry, environmental and governmental interests, our Task Force has been able to identify principles upon which can be constructed a functional stormwater quality program. We believe our legislative proposal attached to this statement incorporates those principles. It is:

- environmentally responsible;
- protects the integrity of, and continues progress toward, national water quality objectives;

- is responsive to, and reflective of, regional needs and variations;
- is measurable and enforceable; and holds municipal permittees accountable for their program efforts; and,
- protects local municipalities against unachievable compliance mandates and against indefensible enforcement actions.

As presently structured, the stormwater quality provisions of the CWA is a regulatory program in which the large majority of participants will be in continual unavoidable violation of the program requirements. As such, it is a program which has little chance of achieving its objectives. Such a program is not what Congress intended and can only collapse under the weight of an impossible compliance burden - a good idea cursed by an ill-conceived performance mandate.

It has been the effort of the California Stormwater Quality Task Force to identify the constructs of a functional workable stormwater quality program. It is now the task of the Congress to amend the Clean Water Act in such a way as to make the functional, workable stormwater quality management program a legal program.

## THE CLEAN WATER ACT REAUTHORIZATION:

A PROPOSAL FOR AMENDING NPDES PERMITTING OF MUNICIPAL  
SEPARATE STORM SEWER SYSTEMS  
Submitted by the  
CALIFORNIA STORMWATER QUALITY TASK FORCE

FINAL CONCEPT DRAFT: MARCH 26, 1993

An amendment to the Clean Water Act to place municipal stormwater in a separate section, to create a stormwater quality management program as the functional definition of "maximum extent practicable" (MEP) and to clarify that MEP as so defined is the basis for enforcement of this section of the Clean Water Act.

Sec 402(p) Industrial Stormwater Discharges

Revise to apply to industrial discharges only.

Add New Section:

Sec 402(q) Municipal Separate Stormwater Discharges

- (1) GENERAL RULE - Beginning October 1, 1992, the Administrator, or the State in the case of a permit program approved under Section 402 of this Act, shall require a permit under this section for discharges from municipal separate storm sewer systems.
- (2) EXCEPTIONS - Municipal separate storm sewer systems serving a population of less than 100,000, and municipal facilities in such systems defined as stormwater discharges associated with industrial activity pursuant to Section 402(p) and owned by the municipality owning such municipal separate storm sewer system, shall be exempt from permit requirements hereof until October 1, 1996, except as provided in paragraph 4 below, or until Phase II of this stormwater quality program is implemented by subsequent federal legislation and regulation.

## (3) PERMIT APPLICATION REQUIREMENTS.-

"(A) LARGE MUNICIPAL SEPARATE STORMWATER SEWER SYSTEM DISCHARGES.- Not later than November 16, 1990, the Administrator shall establish regulations setting forth the permit application requirements for municipal separate stormwater sewer systems serving a population of 250,000 or more. Part I applications for permits for such discharges shall be filed no later than November 18, 1991 and the Part II Application not later than November 16, 1992. Not later than November 16, 1993, the Administrator or the State, as the case may be, shall issue or deny each such permit. Any such permit shall provide for compliance as expeditiously as practicable, but in no event later than 3 years after the date of issuance of such permit, unless otherwise provided in this section.

"(B) MEDIUM MUNICIPAL SEPARATE STORM SEWER SYSTEM DISCHARGES.- Not later than November 16, 1990, the Administrator shall establish regulations setting forth the permit application requirements for municipal separate stormwater sewer systems serving a population of at least 100,000, but less than 250,000. Part I applications for permits for such discharges shall be filed no later than May 18, 1992 and the Part II application not later than May 17, 1993. Not later than May 17, 1994, the Administrator or the State, as the case may be, shall issue or deny such permit. Any such permit shall provide for compliance as expeditiously as practicable, but in no event later than 3 years after the date of issuance of such permit, unless otherwise provided in this section.

- (4) Notwithstanding subsection (2) of this section, the Administrator, or State, may require a permit for any municipal separate storm sewer system where it is determined that the stormwater discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.
- (5) PERMIT REQUIREMENTS - Permits issued after the date of enactment of this section for discharges from municipal separate storm sewer systems:
- (A) May be issued on a system or jurisdiction-wide basis;
  - (B) Shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers;

- (C) Shall require controls to reduce the discharge of pollutants, which may include oil and grease, total suspended solids, heavy metals, nutrients and biochemical oxygen demand, to the maximum extent practicable, including management practices, control techniques and system design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants;
  - (D) Shall require development and implementation of a municipal stormwater quality management program for implementation of the permit requirements described in paragraphs (5)(B) and (5)(C) of this subsection, which program shall be incorporated into the permit and be subject to public hearing and review prior to adoption.
  - (E) Municipalities which have received permits pursuant to section 402(p) of this act, prior to the date of enactment of this section, may elect to continue under the provision of the existing permit, until its normal expiration, or may elect to terminate the existing permit and secure a new permit pursuant to the provisions of this section. If this option is exercised, the provisions of any existing permit shall continue in full force and effect until issuance of the new permit at which time the provisions of the prior permit shall become null and void.
- (6) PERFORMANCE REQUIREMENTS AND CRITERIA -
- (A) For each State, not later than 12 months following completion of the guidance manual identified in subparagraph (6)(A)(iv) hereof, the Administrator, or the State in the case of a permit program approved under Section 402 of this Act, shall, pursuant to the public participation requirements of this act, develop specific minimum mandatory management practices, control techniques, and methods to be included in the municipal stormwater quality management programs required in paragraph (5)(D) of this section, which practices, techniques and methods shall be technologically and financially feasible.

- (i) These mandatory practices, techniques, and methods shall be incorporated into the stormwater quality management programs required in subsection (5)(D) of this section as expeditiously as practicable, but in no event shall implementation of such practices, techniques and methods occur later than during the permit term following the first permit initially issued under Section 402(q).
- (ii) State plans prepared pursuant to paragraph (6)(A) of this section shall be reviewed and certified by the Administrator.
- (iii) The Administrator, or the State in the case of a permit program approved under Section 402 of this Act, shall periodically update the list of mandatory practices, techniques and methods required to be developed under paragraph (6)(A) of this section, to include the most recent technologically and financially feasible stormwater quality controls and to delete those controls proven to be ineffective or not technologically or financially feasible.
- (iv) The Administrator shall, no later than 12 months from the date of enactment of this amendment to the Act, prepare a guidance manual to assist EPA and the States in the development of specific minimum mandatory management practices, control techniques and methods to be implemented pursuant to Paragraph (6)(A) of this section.
- (v) The guidance manual identified in subparagraph (6)(A)(iv) should include a protocol to guide the selection of the minimum methods, practices and techniques to be implemented in the permittee's municipal stormwater quality management program. Such protocol shall consider land use categories, including residential, commercial, industrial and transportation, and shall encourage the implementation of such methods, practices and techniques in the order of the following prioritization: (1) elimination of illicit connections and illegal dumping to the municipal storm sewer system; (2) minimization of the discharge of pollutants in areas of new development or redevelopment; (3) minimization of the discharge of pollutants in areas of

existing development; (4) implementation of pollutant-specific source reduction programs; (5) on-site structural stormwater quality management; and (6) off-site structural stormwater quality management

- (B) The Administrator, or State in the case of a permit program approved under Section 402 of this Act, shall require the inclusion in the municipal stormwater quality management program required in paragraph (5)(D) of this section, of such additional practices, techniques, and methods which target those categories and subcategories of pollutants in municipal stormwater that add significant additional pollution to each portion of navigable waters identified under subparagraph 304(1), 305(b) and 319(a)(1)(A) in amounts which impair the beneficial uses of such waters.
- (i) For known cases of such significant additional stormwater pollution, these additional practices, techniques, and methods shall be implemented by the permittees as expeditiously as practicable, but in no event shall implementation occur later than during the permit term following the first permit initially issued under Section 402(q). For cases of such significant additional stormwater pollution which are identified in the future, such additional practices, techniques and methods shall be implemented during the first permit term following identification.
- (ii) Such additional practices, techniques, and methods shall include specific measures to address such pollutants in discharges from any municipal industrial facilities that may be owned by the permittee and defined as an industrial discharge pursuant to Section 402(p).
- (iii) Such additional practices, techniques, and methods which are determined to be technologically and financially feasible shall be included in the municipal stormwater quality management program required under subparagraph (5)(D); provided, that those additional practices, techniques and methods which are found to be ineffective or not technologically or financially feasible may be deleted from said program.

- (C) For every permit issued under this section, the Administrator, or State in the case of a permit program approved under section 402 of this Act, shall require for the term of the permit the inclusion in the municipal stormwater quality management program required in paragraph (5)(D) of a reasonable and cost effective monitoring and assessment program, to include sampling and analysis and an assessment of the implementation of the practices, techniques and methods required by paragraph (5)(D). Such implementation assessment shall be conducted, at a minimum, of once every year of the permit term.
- (D) For every permit issued under this section, the Administrator, or State in the case of a permit program approved under Section 402 of this Act, shall require for the term of the permit the inclusion in the municipal stormwater quality management program required in paragraph (5)(D) of a reasonable and cost effective maintenance program. Such a program shall specify regular schedules of maintenance, replacement, and repair necessary to maintain the effectiveness of the program.
- (E) For every permit issued under this section, the Administrator, or State in the case of a permit program approved under Section 402 of this Act, shall require the permittee to submit an annual report. The report shall be subject to an independent audit conducted in accordance with guidance promulgated by the Administrator. The report shall include:
- (i) The status of implementing the components of the mandatory and additional management practices, control techniques, and methods required under paragraphs (6)(A) and (6)(B);
  - (ii) A Summary of monitoring and assessment program activities required under paragraph (6)(C); provided that the quantitative data shall be aggregated every fifth year to analyze long term changes and results.
  - (iii) The status of the effort to effectively prohibit non-stormwater discharges into the storm sewers as required under paragraph (5)(B);

- (iv) A Summary of municipal stormwater quality management program revenues and costs for the reporting period, and when possible the budget for the next reporting period.
- (F) For every permit issued under this section, the Administrator, or State in the case of a permit program approved under Section 402 of this Act, shall provide for public participation in the development of the municipal stormwater quality management program required in paragraph (5)(D) of this section. Such public participation shall, at a minimum, include the following: (i) public review and comment opportunities provided pursuant to Section 402 of the Act; (ii) solicitation of public input and comment on the scope, strategy, monitoring scheme, and maintenance schedule of management methods, techniques and practices to be included in the program; and (iii) review of monitoring data collected by urban water quality monitoring organizations.
- (G) The requirements of this section shall be applied consistently with the requirements of Section 304 (1) of this Act.
- (7) STUDIES - The Administrator, in consultation with the States, shall conduct studies as defined herein.
  - (A) For those municipal storm sewer systems for which the obligation to secure a permit are deferred pursuant to subsection (2) of this section, studies shall be conducted for the purposes of:
    - (i) Identifying such systems;
    - (ii) Estimating the nature and extent of pollutants in such discharges and the impacts of such discharges on designated beneficial uses; and
    - (iii) Establishing procedures and methods to control such stormwater discharges to the maximum extent practicable to prevent or reduce impairment of beneficial uses.

Not later than October 1, 1995, the Administrator shall submit to Congress a report on the results of the study described in subparagraph (7)(A)(i)(ii) and (iii).

- (B) For municipal separate storm sewer systems for which the obligation to secure a permit is not deferred pursuant to subsection (2) of this section, studies shall be conducted for the purpose of providing research and technical support and assistance relating to:
- (i) Establishment of a methodology for determining stormwater quality criteria which protect the waters of the United States from impairment of beneficial uses because of the discharge of municipal stormwater, which methodology shall be technologically and financially feasible and which shall be completed no later than 5 years from the date of enactment of this amendment to the Act; and such criteria shall be incorporated into the municipal stormwater quality management program no later than 10 years from the date of enactment of this section.
  - (ii) Determination of the impacts of the management practices, controls, methods and techniques implemented pursuant to this section on the designated beneficial uses of receiving waters; and
  - (iii) Assessment of related issues.
- (C) Not later than five years after enactment of this amendment, and after providing an opportunity for public comment, the Administrator shall submit a Report to Congress evaluating (1) the proportionate sources of stormwater pollution, including the contribution of all classes and categories of on-road motor vehicles to stormwater pollution, inclusive of contributions from emissions, leakage of oil and other motor vehicle fluids, materials from brake linings, and other vehicle components; and (2) available or potentially-available technologies for reducing the contributions of such pollutants.

## (8) REGULATIONS

- (A) For those municipal stormwater discharges for which permits are deferred pursuant to subsection (2) of this section, not later than October 1, 1996, the Administrator, in consultation with State and local officials, shall issue regulations, based on the results of the studies conducted under paragraph (7)(A), which designates the categories of municipal stormwater discharges to be regulated to protect water quality. The regulation shall also describe a comprehensive program to control such municipal stormwater discharges. The program shall, at a minimum:
- (i) establish priorities;
  - (ii) establish requirements for state stormwater management programs which requirements are consistent with the stormwater management program guidance established in paragraph (6)(A)(iv) and (6)(A)(v) of this section; provided however, that upon a demonstration by such a municipality that compliance with such sections is infeasible, the State and municipality may devise an alternate management program;
  - (iii) establish expeditious deadlines.
- B. Upon completion of the study conducted pursuant to Section (7)(C) hereof, the Administrator shall report the results thereof to the Congress with recommended regulations concerning the reduction of stormwater pollution at its source, including recommended regulations relating to the design and construction of on-road motor vehicles, determined by such study to be necessary to reduce sources of stormwater pollution from such vehicles to the maximum extent economically and technologically feasible. Such recommended regulations may distinguish between the size and purpose of vehicle classes and categories, and shall consider all available technologies to reduce or eliminate vehicular sources of stormwater pollutants. The recommended regulations may address performance standards governing the maximum degree of leakage or other sources of stormwater pollution from motor vehicles, or may propose appropriate design or construction standards and requirements; provided, that nothing in this Act shall supersede the Air Quality Management Act relative to vehicular emissions, and further provided that any vehicle

manufacturer may petition the Administrator to determine that alternative design and construction methods achieves the same or superior performance in terms of preventing stormwater contamination. The Administrator's report to the Congress shall be transmitted no later than 6 years after enactment of this amendment to the Act, and shall include the proposed schedule of implementation of and compliance with the recommended regulations.

(9) PERMIT COMPLIANCE

- (A) Implementation of the practices, techniques, methods and the monitoring and assessment program set forth in the municipal stormwater quality management program and permit as required under paragraph (5)(D) and (6)(C) shall be the basis for determining compliance with the Act.
- (B) Compliance shall be evaluated and determined annually by Administrator or State based on submittal of annual reports as required under paragraph (6)(E) of this section.
- (C) Enforcement action related to noncompliance with permit conditions established pursuant to paragraph (5)(D) and (6)(C) of this section shall be in accordance with the provisions of paragraph (9)(A) Section 402q.

Statement of the  
Association of Metropolitan Sewerage Agencies  
before the  
Subcommittee on  
Water Resources and Environment  
of the  
House Public Works and Transportation Committee  
on the  
Reauthorization of the Clean Water Act

April 1, 1993

PRESENTED BY KEN KIRK, EXECUTIVE  
DIRECTOR, ASSOCIATION OF  
METROPOLITAN SEWERAGE AGENCIES

ON BEHALF

OF

J. Wayne Sylvester  
President, AMSA Board of Directors  
General Manager  
County Sanitation Districts of  
Orange County  
Fountain Valley, California

*Dedicated to Environmental Improvement for Over 20 Years*

♻️ Printed on Recycled Paper

Mr. Chairman and members of the Subcommittee, I am Wayne Sylvester, General Manager of the County Sanitation Districts of Orange County, California. I appear before you today representing the Association of Metropolitan Sewerage Agencies (AMSA). AMSA's members represent the nation's largest wastewater treatment agencies. We serve the majority of the sewered population in the United States, and collectively manage over 14 billion gallons of wastewater each day.

I am pleased to be here today as the President of AMSA to provide our perspective on the reauthorization of the Clean Water Act. We sincerely appreciate the opportunity to share with you our thoughts and recommendations as environmental practitioners dedicated to protecting and improving the quality of the nation's waters.

AMSA is a supporter of reauthorization of the Clean Water Act and its goal of fishable and swimmable waters. AMSA believes that this reauthorization must use an integrated and comprehensive strategy that establishes new priorities for achieving water quality goals. It must recognize the wide range of conditions present in the nation's watersheds and provide flexibility to decision makers so that they can address site-specific conditions. It must target both point and nonpoint sources. It must develop mechanisms for control that properly balance environmental gains and their cost-effectiveness. And it must provide the funding to implement its clean water mandates.

#### PUTTING THE REAUTHORIZATION INTO PERSPECTIVE

First and foremost, it is important to put reauthorization of the Clean Water Act into an historical perspective. This nation, its states, cities and towns have made enormous progress in the more than 20 years since the passage of the 1972 Clean Water Act. In 1972, national standards that targeted point sources made sense. We had identifiable problems traceable to easily controlled sources. Congress provided funding, necessary deadlines and enforcement mechanisms. Coupled with a considerable amount of public support and motivation, this set the stage for our nation to successfully address many of its clean water challenges.

Today is a totally different situation. While public support for environmental progress and improvement continues, the new and emerging issues we must address are more complex and costly. The control of combined sewer overflows and the management of stormwater and nonpoint sources of pollution provide excellent examples. Today, fiscal shortfalls at every level of government are unprecedented, which makes dollars harder to get.

#### RECONCILING CONSTRAINTS/EXPECTATIONS/NEEDS

In a reauthorized Clean Water Act we need to reconcile the constraints of the 1990's with our continued high expectations and the need to make continuing progress. Reconciling constraints with expectations within the context of the Clean Water Act will involve several things, the first of which is an increased Federal financial commitment, in partnership with state and local governments. Attached to my testimony is a report AMSA has published called "The Cost of Clean". Among the key findings of the report are the following:

- Funds totalling over \$23 billion will be required for AMSA's member agencies to meet currently mandated clean water needs to the year 1995;
- [CHART] We can expect operation & maintenance costs -- which are paid totally by local government -- to double every eight years;
- [CHART] Historical data allows us to project that annual household user fees will, at a minimum, double every six years; and that
- [CHART] Currently, local governments pay 80 - 90% of the Cost of Clean.

I believe that we -- my colleagues on this panel and the members of this distinguished Subcommittee -- should work together to keep the Federal feet to the fire. We must not lose sight of the fact that this is a national program -- with an integral relationship to our long term environmental health and economic growth. For many years all of us have spoken in support of a Federal, state and local partnership, but local government's 80 - 90% piece of the funding pie does not represent an equitable, shared partnership. And it interferes with our forward progress -- the ratepayer backlash that some communities are now experiencing is one prime example of this.

Our job -- the collective mission embodied in the national clean water program -- is far from done. AMSA believes that an annual funding level of \$6 billion through FY 1997 is warranted, at which time our national needs should be reassessed. We believe this money should be disbursed as both loans and grants, and we believe an evaluation of dedicated sources of revenue should accompany, and be coupled with, increased general fund revenues. The new Administration has voiced a commitment to the environment, but many other national priorities exist. We all recognize that the quest for clean water funding will be a struggle; however, our clean water partnership needs not only a short term, but also a long term stimulus.

The next step in reconciling constraints with expectations is for all of us to refocus our concerns and priorities. We need to resist the temptation to set unrealistic deadlines and prescriptive national solutions to local problems. Prescriptive national solutions do not, by their nature, provide the level of flexibility necessary to consider site-specific circumstances and result in the unnecessary expenditure of ever more scarce resources.

In support of this recommendation for necessary and desirable flexibility, I offer the following example. The U.S. Environmental Protection Agency has just completed the comment period on a new National Combined Sewer Overflow Control Policy. The policy -- developed as a result of a stakeholder negotiation process in which AMSA took part - - provides the level of direction local communities have needed to proceed with CSO controls. In the policy, this national direction is coupled with sufficient flexibility to consider site-specific variables. It is a welcomed solution to a difficult and complex

problem and, in our view, eliminates the need for further legislative action within the Clean Water Act reauthorization to address CSOs. The Federal government should know, without a doubt, that it's on the right track when the Association of Metropolitan Sewerage Agencies, the Natural Resources Defense Council and the Environmental Defense Fund all sign a single letter of support for a national policy. And that is exactly what we were able to do in this case.

There is one more very important temptation that we must -- as a nation -- resist. I speak of the propensity to attempt to fix programs that aren't broken. There's an old adage, "If it isn't broken, don't fix it." That adage applies to many of the programs within the Clean Water Act, among them our national programs for industrial pretreatment and biosolids management. They are not broken -- I urge you not to attempt to "fix" them.

However, there are numerous things you can provide to make the nation's Clean Water Program work better. We ask that, in the reauthorization of the Clean Water Act, you provide local governments with a level of much needed flexibility that I alluded to earlier. We ask that you better define the roles of anti-backsliding and anti-degradation in the context of the Act, and we suggest that anti-degradation should be assessed based on existing beneficial uses. We envision a new Act that provides for the much needed development of wet weather water quality standards.

A reauthorized Clean Water Act should provide increased funding for additional research for use in water quality management decisions and a clear and present affirmation that science and risk assessment serve as the foundation for water quality decisions. We encourage you to eliminate potential barriers to the beneficial use of biosolids and oppose bans or unreasonable restrictions on the interstate transport of this valuable national resource. Additionally, we encourage you to focus your attention and resources on clearly defined problems.

#### THE SEARCH FOR A SOLUTION

It's a tall task and we're very aware that many come before you with problems and complaints, but no solutions. But along with our requests and recommendations, we are also prepared to offer a solution. AMSA views a national program for comprehensive watershed management as the best way to link limited resources with continued environmental improvements. Our Association spent much of the last two years, as did Water Quality 2000 -- who testified before you yesterday -- coming to one clear conclusion. Our shared conclusion was that comprehensive watershed management, as a means to achieve our national water quality goals, makes a lot of sense.

With our testimony we have provided you with a copy of proposed legislation we have drafted entitled, the Comprehensive Watershed Management Act of 1993. The vision contained in the Comprehensive Watershed Management Act of 1993 calls for the development of comprehensive watershed management plans with the participation of all point sources, nonpoint sources, users of the watershed, citizens and levels of

government. Through the proposed legislation, the reduction of pollutant loadings follows rationally from a scientific analysis of site-specific conditions and the technologies available to improve those conditions. Priorities are established based on the quality and use of receiving waters, ecosystem health, and the sources of pollutants that legitimately threaten the watershed.

AMSA believes that comprehensive watershed management planning must emphasize establishing priorities, maintaining flexibility and empowering local, regional and state government and the affected community-at-large to solve their unique problems. AMSA's comprehensive watershed management legislation provides:

- a geographic framework that places public policy on water quality issues into a relevant and cost effective context;
- an institutional framework for developing watershed management strategies by creating watershed management commissions;
- a management framework for comprehensive watershed management planning by requiring a step-by-step evolution of policies, standards, requirements, plans and programs;
- a technical and scientific framework by identifying methods to evaluate, attain, monitor and maintain watershed-specific water quality objectives. This technical framework would emphasize appropriate point and nonpoint source controls and incentives, as well as financing plans to attain water quality objectives; and
- a regulatory framework that provides Federal oversight and enforcement of locally-created comprehensive watershed management plans through the existing National Pollutant Discharge Elimination System (NPDES) program and other mechanisms.

In conclusion let me suggest the following. We need to consistently search for better ways of doing things -- more flexibility and more attention to site-specific variables. A better public awareness of what the problems are, the importance of solving them, and the best solutions. In short, a better understanding of the most effective, yet pragmatic means through which we can accomplish our national clean water goals. There has to be a measurable and meaningful return for our investment.

Now, as we shift our attention to controlling as yet unaddressed sources of pollution, we all recognize that we have a long way to go. No one ever suggested that the task of improving and protecting the nation's waters would be an easy one -- however, working together, I know we can succeed.

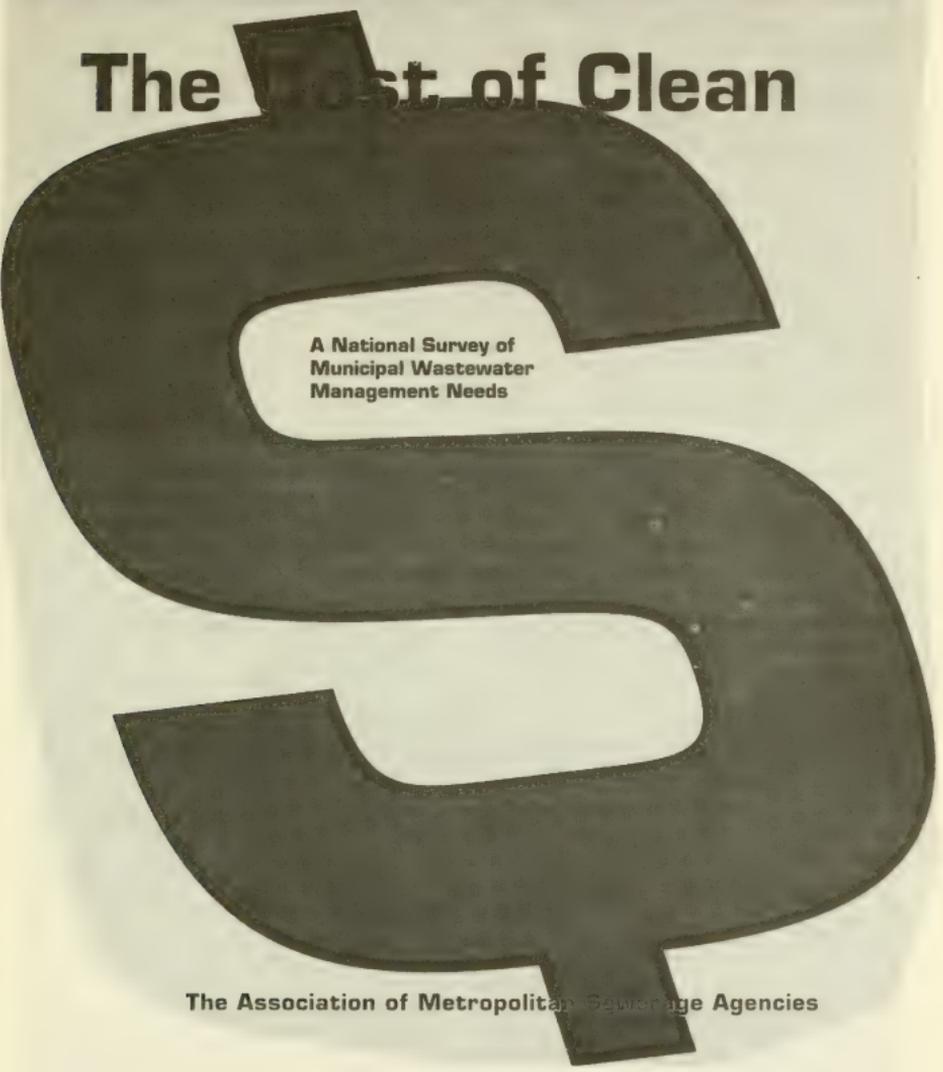

This concludes my testimony. I would be pleased to answer any questions you may have.

# The Cost of Clean

**A National Survey of  
Municipal Wastewater  
Management Needs**

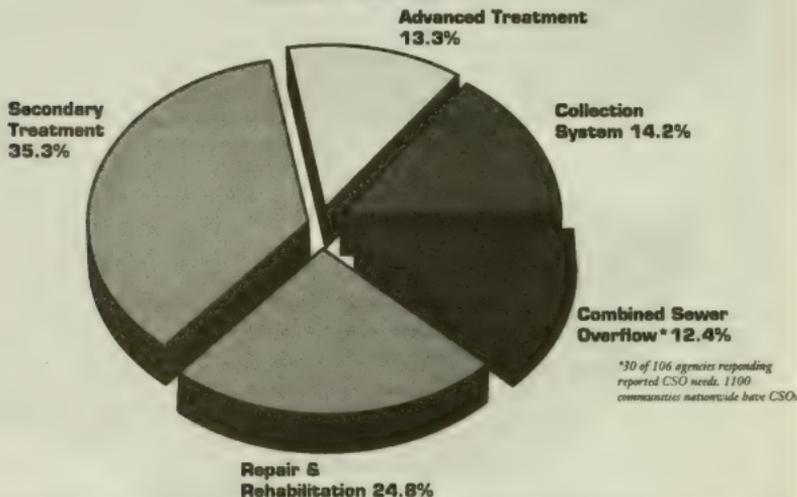

**The Association of Metropolitan Sewerage Agencies**

**skyrocketing costs pose a financial hardship**

This report, and many others recently published, documents the fact that our water pollution control needs, as a nation, are considerable — in fact some may call them “mind-boggling.” Emerging needs such as combined sewer overflows, stormwater management, nutrient control, and nonpoint source controls will clearly require additional funds.

The reality of the situation is that environmental mandates have increased in both their number and cost, and Federal financial support of the nation’s clean water program has diminished. As a result, the nation’s ratepayers have been asked time and time again, to pay an increasing share of this financial burden. Without a doubt, the price tag for ongoing water quality needs will continue to escalate. The question we must address as a Nation is who will pay “The Cost of Clean.”

### Capital Needs 1990-1995 \$22.6 Billion

\* Capital needs for the 1990-1995 period totaled \$22.6 billion. The total documented needs represent committed projects, projects underway, and projects scheduled to begin during this period. Needs in the areas of inflow and infiltration and stormwater management are included in the Collection System category, while air quality needs are reflected in Advanced Treatment. Rehabilitation costs reflect a growing emphasis on the repair and replacement of existing treatment systems, many of which were built in the early years of the Clean Water Act. This trend is expected to continue for years to come.

**Cleaner environmental  
does not come free of charge**

*The Arizona Republic*  
March 8, 1992

**Headlines from across the nation** decry both the need for environmental protection and the desire to control costs. In recent years, local governments — and in turn their citizens — have paid an ever increasing share of "The Cost of Clean".

The Clean Water Act's historic focus on technology-based standards and end-of-pipe treatment, framed by aggressive schedules for compliance, and supported by significant Federal funding, has achieved enormous reductions in pollutants discharged to our nation's waters. The success we have experienced required each of these elements, and would have been impossible without one in particular — the significant Federal support provided through the Construction Grants Program.

The fact is, the Grants Program worked. Federal, state and local monies provided the impetus to improve and protect our nation's waters. And, as a result, much has been accomplished.

**Today our focus must shift to a more comprehensive approach**, addressing the control of more complex and diverse sources of pollution. One thing, however,

must not change. Continued Federal funding of projects mandated by the Clean Water Act — within the context of a balanced Federal/State/Local partnership — is critical to the ultimate achievement of national water quality goals.

As we narrow our sights on remaining pollution problems, ratepayers must not be forced to bear this burden alone. The

nonsewered population also realizes the benefits of clean water. And while large populations located in

major metropolitan areas provide a considerable financial base, they also include large numbers of low income, and poverty level residents who would find significant additional rate increases unbearable.

**The Federal government shares in this financial responsibility.** Our job is not done, and Congress has an important and continuing role in this process. As long as significant environmental improvements are federally-mandated, the Federal commitment to funding assistance must continue.

## ----- Sewer rates to jump

*Wisconsin State Journal*  
December 3, 1991

## LEGISLATION MAY INCREASE COSTS

*The Newport Beach/Costa Mesa Daily Pilot*  
March 18, 1992

**Compelling national interests, not only environmental and public health, but economic, social and political, make necessary an aggressive and comprehensive effort** to preserve existing water resources and restore polluted waterbodies and basic infrastructure as rapidly as possible. This massive task means that we must intelligently and successfully target our clean water resources to give priority to the most serious problems and identify where we get the most environmental benefit for the least cost. Consequently, we must use the reauthorization of the Clean Water Act to establish processes that will give the country an integrated and comprehensive strategy that establishes new priorities for achieving clean water goals.

### A new Clean Water Act must

target point and nonpoint sources. It must encourage innovative multi-media strategies as an indispensable component of clean water planning.

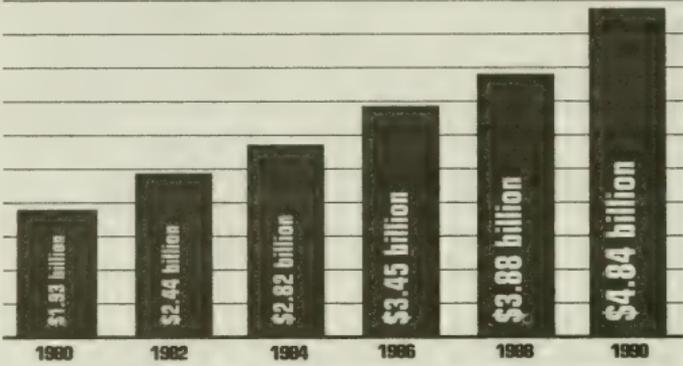

Finally, it must consider not only our hopes and dreams for the future, but also the realities of funding needs and availability, and the constraints that limited funding will impose on the pace we can maintain.

## Sewer fee hike headed for city

*The Sun Press*  
January 31, 1991

### Annual Operation & Maintenance Expenses\* For 144 AMSA Member Agencies

\*1983, 1987, and 1990 AMSA Financial Survey

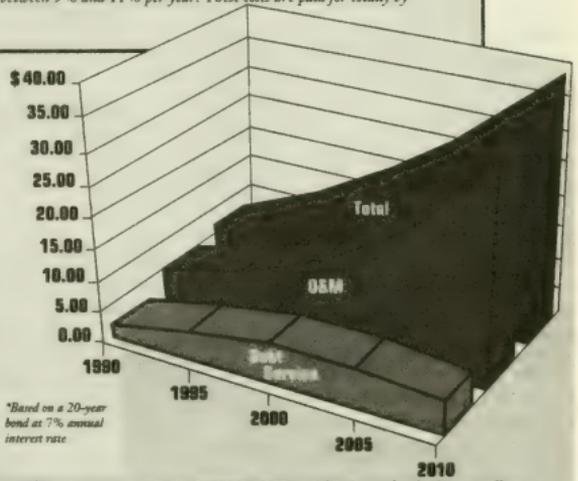

\* Operation & Maintenance (O&M) costs, traditionally make up a higher percentage of a local agency's budget than capital costs. As new technologies are applied to meet more stringent requirements, the costs associated with operation & maintenance increase. Based on past surveys, we can project that O&M expenses will double every 8 years, with increases between 9% and 11% per year. These costs are paid for totally by local communities.

### Projected Needs to 2010

Projected Revenue Required (in \$billions)

1990	O&M	\$ 4.84
	Debt Service*	\$ 1.74
	Total	\$ 6.58
1995	O&M	\$ 7.86
	Debt Service*	\$ 4.20
	Total	\$12.06
2000	O&M	\$12.78
	Debt Service*	\$ 6.36
	Total	\$19.14
2005	O&M	\$20.77
	Debt Service*	\$ 6.59
	Total	\$27.36
2010	O&M	\$33.75
	Debt Service*	\$ 5.47
	Total	\$39.22

\*Based on a 20-year bond at 7% annual interest rate

\* Projections of debt service and operation & maintenance needs for the 1990-2010 period indicate that high costs will not diminish in the future. AMSA's Needs Survey results focus only on costs associated with compliance with existing requirements. As communities face new environmental mandates, the cost burden will continue to escalate.

## Funding Capital Needs: Who Pays?

• Of the current \$22.6 billion 1990-1995 capital needs only \$1.8 billion, or 8% of the total needed, is expected to be financed by Federal assistance. Currently, local governments, through rates and taxes, carry 80% or more of the capital burden — in addition to 100% of the sharply increasing operation, maintenance and replacement costs.

The 11% projected State funding includes State Revolving Loans which are ultimately repaid with local funds, increasing the real local burden to over 90% of the total wastewater capital costs.

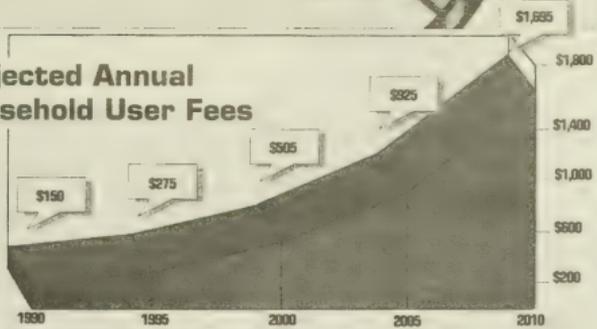

**Local Governments 80%**

**State Governments 11%**

**Federal Government 8%**

**Other 1%**

### Projected Annual Household User Fees

• Annual household user fees are now doubling every six years. They are projected to rise at an even greater rate in the future due to increased local funding of capital projects, increased operation & maintenance costs associated with higher levels of treatment and newly mandated environmental programs. The issue of increasing user fees heightens political pressures as rate increases impact the users, especially those on fixed or limited incomes.

OVERVIEW & PRINCIPAL TENETS

**THE COMPREHENSIVE WATERSHED MANAGEMENT ACT OF 1993****\*\* AN OVERVIEW \*\*****BACKGROUND**

The Clean Water Act's historic focus on technology-based standards, end-of-pipe treatment, aggressive compliance schedules and significant federal funding, has achieved enormous reductions in the pollutants discharged to our nation's waters. While this approach produced significant benefits, the future application of technology-based standards will not result in the same level of water quality improvements.

Achieving tomorrow's water quality successes will be far more challenging. Solutions will be less straight forward, funding more difficult and new players must play a role in solving problems.

As we look ahead to a reauthorized Clean Water Act, our focus must shift to a more comprehensive approach to clean water goals. Addressing the control of costly, more complex and diverse sources of pollution will require both creativity and flexibility. And attainment of water quality goals through pollution control and prevention will depend on a variety of individual decisions by local, state and federal agencies. Rising capital costs make it imperative that cost-effective alternatives for pollution control and prevention be fully analyzed and that comprehensive management strategies be established for prioritizing water quality decisions on a watershed-specific basis.

The Association of Metropolitan Sewerage Agencies (AMSA) shares with many others the vision of a new Clean Water Act. This vision begins with the preservation of our achievements of the past twenty years, proceeds with the identification of water quality and ecosystem health impairments, quantifies the point and nonpoint contributions of pollutants to major drainage systems or watersheds, and results in a comprehensive plan for each watershed -- all with the goal of moving toward the water quality improvements necessary to give us meaningful environmental benefit.

AMSA has taken on the task of crafting a federal legislative initiative, the Comprehensive Watershed Management Act of 1993, for two reasons. First and foremost, to facilitate the achievement of the goal of meaningful environmental benefits from water quality improvements and secondly, in response to requests from national policy makers to define the specific components of a comprehensive watershed management program that could be national in scope.

## Comprehensive Watershed Management Act

March 1993

Overview

Page -2-

The vision contained in the Comprehensive Watershed Management Act of 1993 calls for the development of comprehensive watershed management plans with the participation of all levels of government, point sources, nonpoint sources, users of the watershed and citizens. Through the legislation, the reduction of pollutant loadings follows rationally from a scientific analysis of site-specific conditions and the technologies available to improve those conditions. Priorities are established based on the quality and use of receiving waters, ecosystem health, and the sources of pollutants damaging to those concerns.

AMSA believes that comprehensive watershed management planning must emphasize establishing priorities, maintaining flexibility and empowering local, regional and state government and the community to solve their unique problems. AMSA's comprehensive watershed management legislation provides:

- an institutional framework for developing watershed management strategies by creating watershed management commissions;
- a management framework for comprehensive watershed management planning by requiring a step-by-step evolution of policies, standards, requirements, plans and programs;
- a technical and scientific framework by identifying methods to evaluate, attain, monitor and maintain watershed-specific water quality objectives. This technical framework would emphasize appropriate point and nonpoint source controls and incentives, as well as financing plans to attain water quality objectives; and
- federal regulatory oversight and enforcement of locally-created comprehensive watershed management plans through the existing National Pollutant Discharge Elimination System (NPDES) program and other mechanisms.

### PROCESS

In February of 1992, AMSA's Board of Directors endorsed ongoing AMSA efforts on comprehensive watershed management. The Board's commitment to developing this concept was evidenced by the formation of a Comprehensive Watershed Management Committee and an assignment to that Committee to draft legislative language to establish comprehensive watershed management on a national scale.

Since that time this effort has proceeded, supported by the participation of AMSA's membership and a wide variety of outside organizations and entities. A significant compo-

Comprehensive Watershed Management Act  
March 1993  
Overview  
Page -3-

ment in the development of this legislation has been a concerted effort to not only build consensus on this issue within AMSA's membership nationally, but also to reach out to a diverse array of organizations and entities that would be affected by its passage. This effort to build coalitions and reach consensus recognizes that by vesting regional environmental planning at the local and state level, the management responsibilities fall to the people who know the problems best, who can focus attention on their resolution, and who have a stake in seeing the problem solved.

In mid-January of 1993, and again in early February, AMSA's draft legislative language was discussed at meetings of AMSA's leadership. In numerous meetings with other interested parties, comments were received from a wide variety of points of view.

**PRINCIPAL TENETS**

AMSA's leadership adopted the following principal tenets to guide the development of the Comprehensive Watershed Management Act of 1993:

**PRINCIPAL TENETS OF THE  
COMPREHENSIVE WATERSHED MANAGEMENT ACT OF 1993**

**Adopted by AMSA's Board of Directors  
February 4, 1993**

1. The overall objective of comprehensive watershed management planning is to make cost-effective, site-specific decisions that achieve water quality objectives that protect the designated beneficial uses of a watershed.
2. Science must be the basis for public policy decisions.
3. All players must be at the table to equitably address future water quality objectives.
4. Local government and publicly-owned treatment works must have an active role in establishing water quality objectives for the watersheds in the which they are located.
5. Local stakeholders (government entities, sources of watershed impacts, users of the resources within the watershed, the public and others with a specific interest in how the watershed is managed) must have the clearly stated opportunity to provide recommendations and direct advice and counsel to the Governor regarding the designation of their watershed boundaries and the makeup of its Commission.
6. Progress on water quality improvement, including minimum standards of operation (MSOs), must continue as comprehensive watershed management planning moves forward. Until a watershed management plan is completed, permitting agencies that are responsible for National Pollutant Discharge Elimination System (NPDES) permits must take into account those sources within a watershed that cause water quality impairment and must accordingly exercise flexibility and discretion in exerting their regulatory authority in setting effluent limits and compliance schedules, and in conducting enforcement activities.
7. Time frames for completing a comprehensive watershed management plan must be realistic.
8. Implementation of elements of the comprehensive watershed management plan must be verified and enforced to assure equity among all sources or categories of sources of pollutants of concern in a watershed.

**Comprehensive Watershed Management Act****Principal Tenets**

Page -2-

9. The scheduling of compliance with Clean Water Act requirements and prioritization of resources to achieve water quality objectives shall be guided by watershed plans. One expected outcome of an approved watershed management plan is that NPDES terms, conditions and limits shall be modified as appropriate to cost-effectively achieve the water quality objectives of the plan.
10. Comprehensive watershed management planning and the federal/state legislative and regulatory framework shall be compatible and fully integrated.

## SECTION-BY-SECTION ANALYSIS

**SECTION-BY-SECTION ANALYSIS/RATIONALE**

The following provides a section-by-section analysis of the legislative language accompanied by the rationale (where appropriate) that served as the basis for specific sections.

**SECTION 1. SHORT TITLE.**

The Comprehensive Watershed Management Act 1993.

**SECTION 2. FINDINGS.**

Presents twelve findings which support the implementation of a national comprehensive watershed management planning process.

**SECTION 3. COMPREHENSIVE WATERSHED MANAGEMENT.**

Amends the Federal Water Pollution Control Act by adding a new Section 321 providing for the implementation of a national watershed management planning process.

**DEFINITIONS --**

Defines the key words contained in the legislation. Definitions are provided for watershed, pollutant of concern, minimum standard of operation, waterbody segment and significant contributor.

**DESIGNATION OF WATERSHEDS --**

Provides for the review of all watersheds within the State, by the Governor, followed by the designation of specific watersheds for watershed management planning (no sooner than 6 months nor later than 12 months after enactment). The criteria for designating and establishing the priority rank in which watersheds are addressed is guided by the need for integrated management of point and nonpoint sources, and other activities impacting water quality, in order to attain or maintain water quality protective of the designated uses of the watershed. The designation of interstate, tribal land and international border watersheds are addressed. Requires the Governor to review the designations, not less frequently than every five years, of the watersheds appropriate for comprehensive watershed management. Solicitation and opportunities for meaningful public participation are provided.

**Rationale:**

As much flexibility as possible was intentionally crafted into this section in an effort to allow the Governor the ability to recognize past successes and existing institutions. The timing of the designation process was crafted in such a way as to allow local stakeholders the opportunity to directly petition the Governor with specific recommendations for watershed designations. It should be noted that point and nonpoint sources in areas outside of the designated watersheds would not fall under the purview of this legislation.

#### PRIORITY RANKING OF WATERSHEDS --

Established three classes of assigned priority for watersheds, Class A, Class B and Class C. Ongoing impairment of designated uses, areas of unique biological significance and existing water quality standards in need of revisions are to be considered by the Governor in assigning priority. Waters listed under Sections 303(d), 304(l), 305(d) and 319(a) of the Clean Water Act are also to be considered in this process.

##### **Rationale:**

The establishment of three classes of ranked watersheds provides for the deliberate, measured initiation of the watershed planning process. Concerns have been expressed with regard to the potential for resource and management problems should all designated watersheds commence planning activities simultaneously. This iterative process has been developed in response to those concerns, providing for the staggered initiation of watershed planning activities.

#### WATERSHED MANAGEMENT COMMISSIONS --

Provides for the appointment of Watershed Management Commissions for Class A watersheds (not later than 6 months after designation), Class B watersheds (not later than 24 months after designation) and Class C watersheds (not later than 48 months after designation). The Commissions are tasked with the development of comprehensive watershed management plans. The membership of the Commissions shall be broadly-based, not exceed 25 members and shall have representatives of the permitting agency, local government, state government, the environmental community, the scientific community, categories of significant point sources, categories of significant nonpoint sources, categories of significant watershed users, U.S. Environmental Protection Agency regional offices, the U.S. Department of Agriculture, when appropriate, and others deemed appropriate. Provisions have been made for the Governor to designate, where they already exist, watershed planning or management panels, conferences, commissions, authorities or similar entities to assume responsibility for comprehensive watershed management. In cases where the Governor(s) fail to appoint a Commission, the Administrator shall intervene.

##### **Rationale:**

In developing this section, AMSA was particularly cognizant of the need to make the Commissions as inclusive as possible of all stakeholders in the watershed, while maintaining a number of members that would not prove to be unmanageable. This section was made quite prescriptive to ensure the inclusion of key stakeholders. AMSA envisions a significant role on the Commissions for local stakeholders, with special consideration given to those agencies within the watershed that now have, and

will have, planning, implementation and enforcement responsibilities under the watershed management plan.

#### **WATERSHED MANAGEMENT PLANS --**

Calls for watershed management plans to be initiated for prioritizing and implementing water quality improvements sufficient to achieve or maintain that water quality which protects the designated uses of the watershed. These plans shall be utilized by the State or Administrator in prioritizing and implementing water quality improvements. The planning process will include a review of pollutants of concern, a source survey, a water resources survey, use attainability analyses (if appropriate), prioritization of concerns and sources, Phase I and Phase II Minimum Standards of Operation and an Action Plan. Planning activities are executed by the Commission, with support from the State(s). Opportunities for public comment, throughout the development of the plan, are provided.

#### **Rationale:**

The Action Plan is the actual "product" of the planning process. Once adopted, the plan serves as the "contract" for government, stakeholders, sources and the public to manage the watershed.

#### **REVIEW OF POLLUTANTS OF CONCERN -**

Provides for a review of existing sources of information to identify pollutants of concern.

#### **SOURCE SURVEY -**

Provides for a survey of all significant sources or categories of sources of pollutants in the watershed to take place, based primarily on existing data sources. These sources are anticipated to include direct discharges, publicly-owned treatment works, stormwater discharges, mining waste, silvicultural and agricultural run-off, urban run-off, air-borne sources and resuspended sediment. The purpose of the survey is to determine the contribution of pollutants of concern from each source. All sources are to be consulted in this process and provided with the results of the survey. If data are insufficient, provisions have been made for additional baseline sampling and monitoring to occur.

#### **WATER RESOURCES SURVEY -**

Provides for the Commission to characterize the existing conditions of the water resources within the watershed. Such characterizations include surface water quality, groundwater quality, sediment conditions, habitat availability,

biological resources and the degree of impairment of designated uses.

**USE ATTAINABILITY ANALYSES -**

If it so chooses, the Commission may conduct, concurrent with the source survey and the water resources survey, use attainability analyses to characterize the physical, chemical, biological and hydraulic nature of selected waterbodies within the watershed. The information gathered from these analyses allows the Commission to propose revisions of designated uses and the development of site-specific criteria, consistent with the Clean Water Act. The scientifically-derived results of use attainability analyses shall provide the basis for policy and regulatory decision-making in the watershed.

**Rationale:**

The legislative language specifies that the Commission establish and approve the scope of any use attainability analysis that is undertaken. It is AMSA's intent that the presence of the permitting agency and EPA as active members of the Watershed Management Commissions, along with this provision requiring approval of the scope of any use attainability analysis, will provide needed confidence at the initiation of the analysis process and ensure the relevancy of the results of the analysis for watershed management planning.

**PRIORITIZATION OF CONCERNS AND SOURCES -**

Requires the Commission to identify and rank priority water quality concerns within the watershed and the pollutant sources or categories of sources having the greatest impact on the priority water quality concerns. As part of this process, the Commissions may, with appropriate supporting documentation, recommend revisions to the State regarding the priority ranking of waters under Section 303(d), the listing of waters under Section 304(l) and the identification of waters under Section 305(b) and Section 319(a) of the Clean Water Act. Provisions are provided for the State to revise the listings to ensure their consistency with the priority rankings.

**PHASE I MINIMUM STANDARDS OF OPERATION -**

Provides for the acknowledgment and endorsement of baseline level (Phase I) minimum standards of operations (MSOs) for significant sources in the watershed to occur within six months after the Commission's appointment. MSOs shall include best management practices or other measures currently included in federal and state legislation, regulation, guidance and policies.

**Rationale:**

Numerous adopted and emerging pollutant management practices are required by current state and federal law. In implementing these requirements, some of the entities that are significant sources within the watersheds are taking the first important steps toward management of their waterbodies. This acknowledges existing law, allows progress to continue, places the Commission's planning process in the context of these practices and serves as the baseline upon which future Phase II MSOs will be developed.

**PHASE II MINIMUM STANDARDS OF OPERATION -**

Provides for the development of guidance for Phase II MSOs for the sources or categories of sources of pollutants of concern. These MSOs may include any combination of pollutant management practices that encompass the broad range of source reduction, recycling and control technology practices. The provision provides that site-specific Phase II MSOs are developed for each watershed. Phase II MSOs are to be developed within 30 months of the appointment of the Commission and are subject to adoption by the State and Administrator to the extent that they are not inconsistent with other provisions of state and federal law. Not later than 12 months after development by the Commission, sources must initiate implementation. The Commissions, after consultation with the sources, are tasked with establishing schedules for implementation and compliance of not longer than a maximum of 3 years. Where Phase II MSOs are to be implemented, numeric effluent limits may not be necessary where the other conditions of the MSOs will maintain water quality objectives. The opportunity for public notice and comment with regard to the Phase II MSOs is provided.

**Rationale:**

The Phase II MSOs are adopted, and implementation initiated, before the comprehensive watershed management plans are completed and adopted. Sufficient information will be available during the 30 months following the Commission's appointment for the Commission to identify and establish site-specific MSOs for all significant sources. The listing of possible Phase II minimum standards "to be considered" by the Commissions, is just that -- a list for their consideration as they assess their particular site-specific variables. The language is not prescriptive in this regard.

**ACTION PLAN -**

Provides for the completion and approval of an action plan, by the

Commission, not later than 42 months after the appointment of the Commission. Components of the action plan are prescribed in the provision and include a description of designated uses by waterbody segment, water quality standards necessary to attain or maintain those uses, a priority ranking of sources and classes of sources of pollutants and impediments, revised Phase II MSOs, a description of control options, waste load allocations, compliance schedules, measures and policies to verify and enforce the plan and a description of funding methods. A two-thirds majority vote of all members of the Commission is required for approval.

**Rationale:**

All of the work, study and insight that the Commission has developed will result in a comprehensive long-term plan to manage the water resources of the watershed. The "product" of the process is the Action Plan that will guide water quality improvement activities. The components of the Plan provides all the methods and mechanisms necessary to ensure that "promises made are promises kept".

**FAILURE TO COMPLETE WATERSHED MANAGEMENT PLANS --**

In the event the Commission fails to complete any element of the watershed management plan, this section provides for the Administrator to either extend the time frame for completion of the plan (for no more than 24 month) or employ other sections of the Clean Water Act as are appropriate to protect water quality in the watershed. The opportunity for public comment with regard to the Administrators course of action is provided.

**COST ALLOCATION --**

Requires significant sources, or categories of sources, to share equitably the costs of implementing the requirements of the plan. Under this provision, no source or category of sources will be required to bear a disproportionate share of these costs.

**Rationale:**

It is envisioned that all stakeholders in the watershed will be invested in both the development and the plan and its implementation. To this end the language establishes a shared distribution of the costs. The use of the word "equitable" in this provisions is not intended to mean an assignment of costs directly equivalent to each source's percentage contribution of pollutants. Instead, the intent is that cost allocations will be based upon a proportionate share of the total costs as determined by the Commission. The legislation is not prescriptive as to the mechanism through which this should be established, but allow flexibility to the Commission in

determining what is appropriate. Previously incurred costs, by any source or category of sources, have no bearing or relevance to this process.

#### **ADOPTION OF ACTION PLANS --**

Requires the Commission to submit the watershed management plan to the State and the Administrator for adoption. The State and Administrator shall adopt the plan to the extent that it is not inconsistent with other provisions of state and federal law.

##### **Rationale:**

Because the State and the Administrator are vested with regulatory authority to oversee and enforce the Clean Water Act and state laws designed to protect public health and the environment, it is necessary that they formally adopt the Plan. Through their direct participation in the Commission, the State and the Administrator will have direct knowledge and confidence in the Plan. The inclusive and consensus-building approach that is explicit in the process described by the Comprehensive Watershed Management Act of 1993, enables them to adopt it as a sound and equitable plan.

#### **IMPLEMENTATION & SCHEDULES --**

Requires the State and Administrator to initiate implementation of the Action Plan, including the schedules provided in the Plan. Plan implementation for point sources is to be based upon NPDES permits. Other sources or categories of sources are to undertake implementation in accordance with authorities available to the State under both state and federal law.

##### **Rationale:**

AMSA acknowledges the importance of the fact that the requirements of the comprehensive watershed management Action Plans be able to be verified and enforced to assure continued equity. In the case of point sources, the ability to verify and enforce would find its foundation in the NPDES permitting program.

#### **REVIEW OF WATER QUALITY STANDARDS & DESIGNATED USES IN THE WATERSHED --**

Requires the Commissions to periodically review and make recommendations to the State with respect to the establishment and revision of water quality standards, including designated uses and water quality criteria. The Commission's recommendations shall be based on an evaluation of the current conditions of water resources, taking into account previous surveys and use attainability analyses, and considering technological and economic capabilities of sources or impediments to meet water quality objectives. It requires baseline conditions to be established by the

Comprehensive Watershed Management Act  
March 1993  
Section-by-Section Analysis/Rationale  
Page -8-

Commission to prevent any additional significant impairment of designated uses or biotic resources. The State, in conducting its triennial review and revision of water quality standards under Section 303(c) of the Clean Water Act, is to ensure that the standards are consistent with the applicable watershed management plan. Additionally, the Administrator is required to review the recommendations adopted by the State and defer to the determinations of the Commissions unless they are contrary to the Act.

**Rationale:**

In recognition of the science-based data collection and monitoring efforts that will play a major role in the watershed planning process, it is simply appropriate that the findings of the plan process guide review of water quality standards and designated uses.

**NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMITS --**

Calls for the watershed management plans to contain recommendations to the permit issuing authority for revisions to the terms, conditions and schedules for compliance provided in permits issued under Section 402 of the Clean Water Act, incorporating the requirements and schedules in the watershed management plan. When existing permits are inconsistent with the priority identification and ranking provided in the plan, the permit issuing authority shall modify permits to be consistent with the plan. The permit issuing authority, in the exercise of any enforcement action, is required to take into consideration, information developed that describes the control options that will achieve or help to achieve water quality standards that will attain and maintain designated uses.

**Rationale:**

One expected outcome of an approved watershed management plan is that National Pollutant Discharge Elimination System terms, conditions and limits will be modified to achieve the water quality objectives of the plan. It should be recognized, however, that this could result in either more stringent or less restrictive requirements.

**PERIODIC REVIEW OF WATERSHED MANAGEMENT PLANS --**

Requires review of watershed management plans to occur within 5 years following adoption of the plan, and not less than every 10 years thereafter. Specific components of the review process and the appropriate considerations for revisions are set forth in the legislative language.

**Rationale:**

Conditions and information available within a watershed will be forever undergoing

change. New sources, improved control technology, improved monitoring techniques, shifting public values and unanticipated factors will mean that today's decisions may not be relevant or effective for tomorrow's conditions. For this reason, it is important to re-evaluate water quality standards, designated uses and the watershed plans on a regularly scheduled basis. This will help ensure that the watershed is managed and protected in the most optimal manner possible.

#### GRANTS & COOPERATIVE AGREEMENTS --

Authorizes the Administrator to make grants to, or enter into cooperative agreements with, States and interstate agencies designated as Commissions and other federal agencies to support the costs of developing and periodically reviewing watershed management plans. Grants or cooperative agreements are not to exceed 75% of the total cost of the program. Gives the States responsibility, in consultation with the Commissions, to establish appropriate means for sources or categories of sources to supplement federal monies in funding the plans.

##### **Rationale:**

This provision is intended to place a large measure of the funding responsibility for adequate watershed planning on the Administrator. Financially supporting those important planning activities will be a key to their success. AMSA recognizes that there are significant differences in the institutional and financial realities of the states. For this reason, flexibility is provided to the states in funding their share of the planning activities.

#### COMPLIANCE WITH THE ACT --

Emphasizes that the provisions do not relieve any source or category of sources from obligation to comply with any other requirement imposed by the Clean Water Act, or with permits issued pursuant to this Act.

##### **Rationale:**

AMSA envisions this provision to allow Clean Water Act requirements to continue throughout the watershed management planning process with the clear acknowledgement that regulatory agencies, by virtue of the active participation on the Commissions, will have the understanding and appreciation of circumstances within the watershed to exercise the maximum amount of enforcement discretion possible, being guided by the scientific data and information that becomes available as the planning process evolves.

#### CONSISTENCY WITH STATE WATER ALLOCATIONS --

Clarifies that the provisions of the new Section 321, or the resulting Action Plans, do

Comprehensive Watershed Management Act  
March 1993  
Section-by-Section Analysis/Rationale  
Page -10-

not supersede, abrogate or impair the authority of States to allocate quantities of water.

#### **AUTHORIZATION OF APPROPRIATIONS --**

Authorizes funds to be appropriated at such sums as are necessary to develop and craft watershed management plans for fiscal years 1994, 1995, 1996, 1997 and 1998.

##### **Rationale:**

Federal funding is provided in the legislation for the comprehensive watershed management planning process only. The costs resulting from the implementation of the plan are funded by all significant sources or categories of sources causing impairment of designated uses in the watershed. Costs are to be shared in an equitable manner, with no source or category of sources being required to bear a disproportionate share. Again, the language is crafted to provide both support for all stakeholders and flexibility among those stakeholders, within the context of the Commission, in allocating costs to each significant source or category of sources with regard to comprehensive watershed management plan implementation activities.

#### **SECTION 4. PERMIT CONSISTENCY.**

Amends the Clean Water Act to provide for ten year permit periods for permittees in designated watersheds. Additionally amends the Clean Water Act to allow for permits to be renewed, reissued or modified in a manner consistent with the developed watershed management plans without violating the anti-backsliding provisions of the Act.

##### **Rationale:**

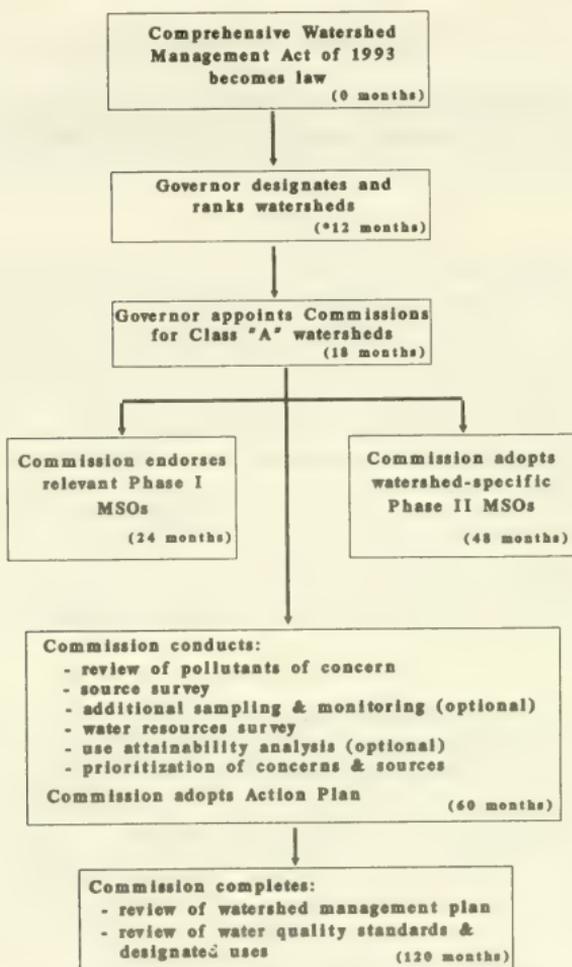

This section provides for two significant amendments to the Act. Of particular significance is the addition, by amendment, of a new exception to the anti-backsliding provisions of the Act. This will allow revisions to permits in a manner consistent with the recommendations made as a result of the data collection and monitoring undertaken as part of the watershed management planning process. Additionally, such an amendment is consistent with other anti-backsliding exceptions which reference the availability of new information or data that was not available at the time permit requirements were established.

COMPREHENSIVE WATERSHED MANAGEMENT  
PLANNING PROCESS FLOW CHART

# The Comprehensive Watershed Management Act of 1993

## Timeline

(Class "A" watershed as example)

Months shown are cumulative

\*Deadline to complete task after the Comprehensive Watershed Management Act of 1993 becomes law

**LEGISLATIVE LANGUAGE**

March 11, 1993

103d CONGRESS  
1st SESSION

H.R. \_\_\_\_\_

To amend the Federal Water Pollution Control Act to establish a program of comprehensive watershed management, and for other purposes

\_\_\_\_\_  
IN THE HOUSE OF REPRESENTATIVES

\_\_\_\_\_, 1993

Mr./Ms. \_\_\_\_\_ (for himself/herself, \_\_\_\_\_) introduced the following bill which was referred to the Committee on \_\_\_\_\_.

\_\_\_\_\_  
A BILL

To amend the Federal Water Pollution Control Act to establish a program of comprehensive watershed management, and for other purposes.

1 *Be it enacted by the Senate and House of Representatives of*  
2 *the United States of America in Congress assembled,*

3 **SEC. 1. SHORT TITLE AND TABLE OF CONTENTS.**

4 (a) **SHORT TITLE.** ----This Act may be referred to as the  
5 "Comprehensive Watershed Management Act of 1993."

1 (b) TABLE OF CONTENTS. ----The table of contents for this Act  
2 is as follows:

3 Table of Contents  
4 Sec. 1. Short title and table of contents.  
5 Sec. 2. Findings.  
6 Sec. 3. Comprehensive watershed management.  
7 Sec. 4. Permit Consistency.

8 **SEC. 2. FINDINGS.**

9 The Congress finds that ---

10 (1) the nation has made a substantial investment in the  
11 protection and enhancement of water quality in its navigable  
12 waters;

13 (2) much of this investment has been targeted at the  
14 improvement of water quality in receiving waters through the  
15 application of treatment technology by municipal and industrial  
16 point source dischargers;

17 (3) this investment in treatment technology has resulted in  
18 substantial progress in meeting our Nation's clean water goals;

19 (4) there is great benefit to be achieved through directing  
20 efforts and funds toward measures that address the full range of  
21 point and nonpoint sources causing water quality impairments;

1 (5) environmental enhancement and economic considerations at  
2 all levels of government and in the private sector, require that  
3 further investment in water quality improvement be targeted first  
4 on those receiving waters most in need of protection, while  
5 preserving previously achieved designated uses in all receiving  
6 waters, and that priority attention be focused on those causes of  
7 impairments which most threaten the attainment and maintenance of  
8 designated uses of such waters;

9 (6) the goals of the Clean Water Act can be best achieved by  
10 integrating the existing requirements of the Act with priorities  
11 established in comprehensive watershed management plans;

12 (7) further progress in the control of water pollution  
13 requires that comprehensive plans for watersheds include a fair and  
14 equitable distribution of the costs and burdens of further water  
15 quality improvement;

16 (8) rising costs make it imperative that appropriate  
17 management alternatives including pollution control and prevention  
18 be fully analyzed and that a comprehensive management strategy  
19 resulting from this analysis be established for prioritizing and  
20 scheduling water quality decisions on a watershed-specific basis;

1           (9) effective stewardship of a watershed depends upon the  
2 full participation of local stakeholders including local  
3 government, the public and those agencies that manage the various  
4 water and wastewater infrastructure systems, during the processes  
5 of evaluation, prioritization and management of the resources  
6 within the watershed;

7           (10) substantive and ongoing public participation is critical  
8 to effective watershed management;

9           (11) comprehensive watershed management is consistent with  
10 the Clean Water Act's provisions supporting comprehensive planning  
11 and recognizing the varying factors in each watershed which affect  
12 water quality; and

13           (12) comprehensive watershed management can result in the  
14 most effective and least costly approach to safeguarding and  
15 improving water quality.

16 **SEC. 3        COMPREHENSIVE WATERSHED MANAGEMENT.**

17           The Federal Water Pollution Control Act is amended by adding  
18 after Section 320 thereof the following new section:

1        SEC. 321 COMPREHENSIVE WATERSHED MANAGEMENT. ---

2            (a) DEFINITIONS. ---

3            (1) WATERSHED. - For the purposes of this section,  
4            the term 'watershed' is defined as one or more hydrologic  
5            units, identified by the Governor(s) to be appropriate  
6            for water quality planning, within which waters flow or  
7            drain into one or more rivers, bays, lakes or estuaries.

8            (2) POLLUTANT OF CONCERN. - For the purposes of this  
9            section, the term 'pollutant of concern' is defined as a  
10           chemical, material or physical property that is of  
11           sufficient concentration, mass or intensity to interfere  
12           with or be reasonably expected to interfere with the  
13           attainment or maintenance of designated uses in the  
14           watershed, or downstream from the watershed.

15           (3) MINIMUM STANDARD OF OPERATION. - For the  
16           purposes of this section, the term 'minimum standard of  
17           operation' is defined as any combination of pollution  
18           prevention, control technology, recycling or other  
19           measures employed to prevent the release, or reduce the  
20           amount released, of one or more pollutants of concern.

1           (4) WATERBODY SEGMENT. - For the purposes of this  
2 section the term 'waterbody segment' is defined as a  
3 subpart of a hydrologic unit consisting of all or a  
4 portion of a stream, river, lake, estuary or coastal  
5 region that, because of its characteristic hydrologic,  
6 biotic, water, or habitat qualities causes it to be  
7 distinct with respect to the qualities of an adjoining  
8 waterbody segment.

9           (5) SIGNIFICANT CONTRIBUTOR. - For the purposes of  
10 this section the term 'significant contributor' is  
11 defined as a person, corporation, government entity or  
12 activity that produces or causes to be produced a  
13 pollutant of concern which enters waters in sufficient  
14 amounts to impair or can be reasonably anticipated to  
15 impair a designated use of a watershed or an activity,  
16 practice or condition which impairs the designated use of  
17 a watershed.

18           (b) DESIGNATION OF WATERSHEDS. --- Not sooner than six  
19 (6) months nor later than twelve (12) months after enactment  
20 of this section, the Governor of each State, shall review all  
21 watersheds in the State, soliciting the advice and counsel of  
22 affected entities, and after solicitation and opportunities  
23 for meaningful public participation, shall designate the  
24 boundaries and the priority rank of the watersheds or portions

1           thereof within the State for comprehensive watershed planning  
2           in which the attainment or maintenance of water quality which  
3           protects the designated uses of the watershed requires  
4           integrated management of point and nonpoint sources and other  
5           activities which may affect water quality. The priority  
6           ranking of a watershed shall be in accordance with subsection  
7           (c). In the case of interstate watersheds, the Governors of  
8           each affected State shall confer prior to the designation of  
9           such watersheds, and wherever possible, jointly designate such  
10          watersheds for management on an interstate basis. In the case  
11          of watersheds within or including tribal lands, the  
12          Administrator shall coordinate watershed designation between  
13          the State and the tribal government. In the case of  
14          watersheds that cross an international border, the  
15          Administrator shall coordinate watershed designation between  
16          the State and the federal commission established to oversee  
17          boundary water quality issues. The Governor shall review the  
18          designations not less frequently than every five (5) years  
19          thereafter, the watersheds appropriate for comprehensive  
20          watershed management. In the event that the Governor of a  
21          State, or the Governors of each affected State in the case of  
22          interstate watersheds, fail(s) to identify or designate any  
23          watershed(s) in the State or States, then the Administrator  
24          shall, within six (6) months of such failure and after notice  
25          and opportunity for public comment designate the watershed(s)  
26          within the State or States(s).

1 (c) PRIORITY RANKING OF WATERSHEDS. --- Watersheds shall  
2 be assigned priority ranking using up to three classes  
3 referred to, for purposes of this section, as Class A, Class  
4 B and Class C. Not less than twenty-five (25) percentum of  
5 the land area of a State shall be ranked Class A. Not less  
6 than twenty-five (25) percentum of the land area of a State  
7 shall be ranked Class B unless more than seventy-five (75)  
8 percentum of land area of a State is ranked Class A. Ranking  
9 shall be established by the Governor after taking into account  
10 ongoing impairment of designated uses, areas of unique  
11 biological significance, existing water quality standards in  
12 apparent need of revision and other relevant factors  
13 considered relevant by the Governor, including consideration  
14 of waters identified or listed under Sections 303(d), 304(l)  
15 305(d) and 319(a) of this Act and after notice and public  
16 comment.

17 (d) WATERSHED MANAGEMENT COMMISSIONS. --- Not later  
18 than six (6) months after the designation of a Class A  
19 watershed and not later than twenty-four (24) months after the  
20 designation of a Class B watershed and not later than forty-  
21 eight (48) months after designation of a Class C watershed  
22 under subsection (b) of this section, the Governor shall  
23 appoint a Watershed Management Commission to develop  
24 comprehensive watershed management plans for one or more  
25 designated watersheds. Any new Commission so appointed shall,

1 as a minimum, be comprised to represent the broad interests  
2 within a watershed, shall include not more than twenty-five  
3 (25) members and shall have as members representatives of each  
4 of the following: the permitting agency, local government,  
5 state government, the environmental community, the scientific  
6 community, categories of significant point sources including  
7 POTWs, categories of significant nonpoint sources, categories  
8 of significant watershed users including public water supply,  
9 U.S. Environmental Protection Agency regional office(s), the  
10 U.S. Department of Agriculture when appropriate and others  
11 deemed appropriate by the Governor. In the case of  
12 international watersheds the federal interboundary commission  
13 shall be represented. In the case of watersheds containing  
14 tribal lands, a tribal council representative shall be a  
15 member. In the case of interstate watersheds, the Governors  
16 of each affected State shall jointly appoint such Commissions.  
17 Where water quality planning or management panels,  
18 conferences, commissions, authorities or similar entities are  
19 in existence prior to the enactment of this section or have  
20 been previously defined by state statute, the Governor or  
21 Governors may designate such entities, with change to their  
22 existing composition to encompass, to the extent practicable,  
23 the representation enumerated in this subsection to assume the  
24 responsibility for comprehensive watershed management under  
25 this section. In designating Commissions the Governor shall  
26 consider the ongoing efforts of existing organizations and

1 agencies managing water quality programs within the watershed  
2 and shall, to the greatest extent practicable, include them in  
3 the Commission. In the event that the Governor of a State, or  
4 the Governor of each affected State in the case of interstate  
5 watersheds, fail(s) to appoint a Commission, then the  
6 Administrator shall, within six (6) months of such failure and  
7 after notice and opportunity for public comment appoint the  
8 Commission in accordance with the representation enumerated in  
9 this subsection. A Commission may create committees or other  
10 bodies comprised in whole or in part of non-Commission members  
11 for the purposes of conveying information and receiving  
12 advice.

13 (e) WATERSHED MANAGEMENT PLANS. --- Each Watershed  
14 Management Commission appointed or designated under subsection  
15 (d) of this section shall develop a comprehensive watershed  
16 management plan for each designated watershed, which plan  
17 shall be utilized by the State, or the Administrator, in  
18 prioritizing and implementing water quality and other  
19 improvements designed to achieve or maintain that water  
20 quality which protects the designated uses of the watershed.  
21 It is the responsibility of the State(s) to support the  
22 Commission in the development of the plans and to establish  
23 appropriate means to provide support of the kind and amounts  
24 that are required to enable the Commissions to conduct their  
25 work. The Commission shall provide appropriate opportunities

1 for substantive public participation during the development of  
2 the plan. Such plans shall include, at a minimum, all of the  
3 following elements ---

4 (1) REVIEW OF POLLUTANTS OF CONCERN. --- The  
5 Commission with support of the State(s), shall complete  
6 a review of existing sources of information to identify  
7 pollutants of concern present in the watershed. The  
8 Commission shall review and consider for utilization to  
9 the greatest extent possible, relevant data contained in  
10 reports completed in accordance with Sections 303(d) and  
11 305(b) of this Act.

12 (2) SOURCE SURVEY. --- The Commission, with  
13 support of the State(s), shall complete a survey of all  
14 significant sources, or categories of sources of  
15 pollutants of concern within the watershed, including but  
16 not limited to direct discharges, publicly-owned  
17 treatment works, stormwater discharges, mining waste,  
18 silvicultural and agricultural run-off and drains, urban  
19 run-off, air-borne sources, resuspended sediment and  
20 other nonpoint sources within the watershed. The purpose  
21 of such survey shall be to determine the contribution of  
22 pollutants of concern from each of the sources or  
23 categories of sources in the watershed. All sources or  
24 categories of sources contributing to the pollutant

1 loading of the watershed shall be consulted in compiling  
2 the baseline data needed to determine the pollutant  
3 contribution of each individual source, or category of  
4 source, of the watershed. The results of the watershed  
5 survey shall be made available to all significant sources  
6 or categories of sources surveyed, and to the general  
7 public. Where the Commission with support of the  
8 State(s) and after opportunity for public comment  
9 determines that there is insufficient data available to  
10 properly document the sources and extent of pollutant  
11 loadings within the watershed, or the relative magnitude  
12 of such pollutant loadings from between and among  
13 significant sources or categories of sources, then the  
14 Commission with support of the State(s) shall undertake,  
15 or cause to be undertaken, additional baseline sampling  
16 and monitoring of pollutants within the watershed to  
17 determine the relative contribution of such pollutants.  
18 The results of such additional baseline sampling and  
19 monitoring shall be made available to significant sources  
20 or categories of sources, and to the general public.

21 (3) WATER RESOURCES SURVEY. --- The Commission  
22 with support of the State(s) shall characterize existing  
23 conditions of the water resources within the watershed.  
24 The characterization shall include surface water quality,  
25 ground water quality, sediment conditions, habitat

1           availability, biological resources, and the degree of  
2           impairment of designated uses.

3                   (4) USE ATTAINABILITY ANALYSES. --- the Commission  
4           may conduct concurrently with paragraphs (2) and (3) use  
5           attainability analyses in the watershed, using up-to-date  
6           and validated field data, to characterize the physical,  
7           chemical, biological, and hydraulic nature of selected  
8           waterbodies in the watershed; and may propose to the  
9           State a revision of designated uses and develop site-  
10          specific criteria, consistent with the Clean Water Act,  
11          as may be appropriate based upon the verifiable  
12          conclusions of the use attainability analyses. The  
13          Commission shall establish and approve the scope of use  
14          attainability analyses. Such use attainability analyses  
15          shall provide the data on the pollutants and/or practices  
16          of concern, their sources, and their impacts upon water  
17          quality and the designated uses of the watershed. The  
18          scientifically-derived results of the comprehensive use  
19          attainability analyses shall provide the basis for policy  
20          and regulatory decision-making in the watershed, but  
21          without prejudice against the adoption of more far-  
22          reaching goals by the Commission. The Commission shall  
23          provide appropriate opportunities for substantive public  
24          participation on the scope of the use attainability  
25          analyses.

1 (5) PRIORITIZATION OF CONCERNS AND SOURCES. ---

2 Based on the review and surveys, including any additional  
3 baseline sampling and monitoring and use attainability  
4 analyses conducted under paragraphs (1) through (4) of  
5 this subsection, the Commission with support of the  
6 State(s) shall, after completion of such reviews, surveys  
7 and use attainability analyses, and after notice and  
8 opportunity for public comment, identify and rank ---

9 (A) the priority water quality concerns  
10 within the watershed, taking into account those  
11 water quality problems posing significant risks to  
12 human health and the environment and interfering  
13 most substantially with designated uses within the  
14 watershed, and

15 (B) the pollutant sources, or categories of  
16 sources, including specific point and nonpoint  
17 sources, and impediments and persons responsible  
18 for them, having significant impacts on priority  
19 water quality concerns within the watershed.

20 In identifying and prioritizing concerns under this  
21 paragraph, the Commission shall review and consider, and  
22 where appropriate, either incorporate relevant findings  
23 of, or recommend revisions to the State, regarding the

1 priority ranking of waters under section 303(d), the  
2 listing of waters under section 304(1) and the  
3 identification of waters under section 305(b) and section  
4 319(a) of this Act. The Commission shall determine if  
5 the basis upon which these existing listings were made is  
6 consistent with the basis upon which priority rankings  
7 were made under this paragraph, and if there are  
8 inconsistencies revise such listings to be consistent  
9 with the priority rankings after notice and opportunity  
10 for public comment.

11 (6) PHASE I MINIMUM STANDARDS OF OPERATION.---

12 Within six (6) months after its appointment, the  
13 Commission shall acknowledge and endorse those relevant  
14 best management practices or other measures currently  
15 included in federal and state legislation, regulation,  
16 guidance and policies, as the Phase I minimum standards  
17 of operation for each source or category of sources in  
18 the watershed. Phase I minimum standards of operation  
19 shall include, but may not be limited to, provisions,  
20 guidance or policy contained in, or resulting from,  
21 sections 208, 319 and 404 of this Act and the Coastal  
22 Zone Act Reauthorization Amendments of 1990.

23 (7) PHASE II MINIMUM STANDARDS OF OPERATION.---

24 Within thirty (30) months of the appointment of a

1 Commission, the Commission shall develop, after notice  
2 and opportunity for public comment, guidance outlining  
3 Phase II minimum standards of operation within the  
4 watershed for sources or category of sources of  
5 pollutants of concern. Phase II minimum standards of  
6 operation shall address priority concerns of the  
7 watershed while the Commission reviews watershed uses and  
8 water quality criteria and until a determination is made  
9 of waste load allocations and other management strategies  
10 to be set forth in the watershed management plan. These  
11 minimum standards of operation may include any  
12 combination of pollutant management practices that  
13 encompass the broad range of source reduction, recycling  
14 and control technology practices. These minimum  
15 standards of operation may include but are not limited  
16 to, nor are required to include the following:

17 (A) FOR DIRECT DISCHARGES ---

18 (i) any combination of economically and  
19 technologically feasible source reduction,  
20 recycling, treatment and water conservation  
21 practices that could significantly reduce  
22 pollutants of concern in the watershed;

- 1 (B) FOR STORMWATER DISCHARGES ---
- 2 (i) enhanced street sweeping,
- 3 (ii) wetlands preservation, restoration
- 4 and construction,
- 5 (iii) installation of buffer strips,
- 6 (iv) runoff detention/retention basins
- 7 to minimize first flush impacts,
- 8 (v) installation of technology to
- 9 encourage infiltration into the ground,
- 10 (vi) utilization of grassed waterways,
- 11 (vii) interception/diversion of
- 12 stormwater run-off,
- 13 (viii) installation of ground cover,
- 14 (ix) installation of sediment traps,
- 15 (x) establishment of streamside
- 16 management zones, and
- 17 (xi) vegetative stabilization/
- 18 mulching;

19 (C) FOR AGRICULTURAL RUN-OFF AND DRAINS ---

- 20 (i) wetlands preservation and
- 21 restoration,
- 22 (ii) animal waste management,
- 23 (iii) erosion control,
- 24 (iv) pesticide management,

1 (v) range and pasture management,  
2 (vi) utilization of effective sod-based  
3 rotation,  
4 (vii) utilization of terraces, and  
5 (viii) application of fertilizers and  
6 pesticides at rates and at times designed to  
7 meet agronomic and pest control needs while  
8 limiting runoff;

9 (D) FOR SILVICULTURE RUN-OFF ---

10 (i) wetlands preservation, restoration  
11 and construction,  
12 (ii) application of log removal  
13 techniques to limit run-off,  
14 (iii) effective pesticide/herbicide  
15 management,  
16 (iv) appropriate maintenance of haul  
17 roads,  
18 (v) effective removal of debris, and  
19 (vi) application of riparian zone  
20 management techniques;

21 (E) FOR MINING WASTE RUN-OFF AND DRAINS ---

22 (i) installation of underdrains, and

1 (ii) implementation of block-out or  
2 haul back practices.

3 The Commission shall submit to the State and the  
4 Administrator its Phase II minimum standards of  
5 operation. The State and the Administrator shall adopt  
6 the Phase II minimum standards of operation to the extent  
7 that they are not inconsistent with other provisions of  
8 state and federal law, respectively. Not later than  
9 twelve (12) months after development by the Commission of  
10 the Phase II minimum standards of operation, sources or  
11 categories of sources shall initiate implementation. The  
12 Commission shall, after consultation with the affected  
13 sources, establish schedules for implementation and  
14 compliance for each source or category of sources, but in  
15 no case may a compliance schedule of greater than three  
16 (3) years be specified for a source or category of  
17 sources. Such Phase II minimum standards of operation  
18 may be reviewed and revised by the Commission during the  
19 development of the Action Plan. Where Phase II minimum  
20 standards of operation are to be implemented, numeric  
21 effluent limits may not be necessary where the other  
22 conditions of the minimum standards of operation will  
23 maintain water quality objectives.

24 (8) ACTION PLAN. --- Not later than forty-two (42)  
25 months after appointment of the Commission and after

1 notice and opportunity for public comment an Action Plan  
2 shall be completed and approved by the Commission by a  
3 two-thirds majority vote of all members of the Commission  
4 that includes at a minimum the following components:---

5 (A) a description of the designated uses by  
6 waterbody segment within the watershed,

7 (B) the water quality standards necessary to  
8 attain or maintain the designated uses by waterbody  
9 segment within the watershed,

10 (C) a priority ranking of all sources or  
11 classes of sources of pollutants of concern and  
12 impediments within the watershed,

13 (D) revised Phase II minimum standards of  
14 operation, where appropriate, for each source or  
15 category of sources and impediments,

16 (E) a description of the various control  
17 options that will achieve or help to achieve water  
18 quality standards that will attain and maintain  
19 designated uses in the watershed that are available  
20 to these sources or classes of sources including  
21 expected reliability, capital costs, operating  
22 costs, energy requirements, expected cross media

1                    impacts and expected impacts of the control options  
2                    on the existing practices of the sources or  
3                    category of sources themselves,

4                    (F) waste load allocation, for each source or  
5                    category of sources, taking into account the  
6                    reductions expected to result from the Phase II  
7                    minimum standards of operation, that establishes  
8                    total maximum allowable daily discharges of  
9                    pollutants of concern necessary to achieve water  
10                    quality standards that will attain and maintain  
11                    designated uses in the watershed and that shall be  
12                    so established as to result, to the greatest extent  
13                    practicable, in the least net costs and cross media  
14                    impacts,

15                    (G) additional technically achievable and  
16                    cost effective controls required beyond minimum  
17                    standards of operation, where appropriate, for each  
18                    source or category of sources of point and nonpoint  
19                    sources, necessary to achieve the water quality  
20                    standards that will attain and maintain designated  
21                    uses in the watershed,

22                    (H) compliance requirements and schedules for  
23                    subparagraphs (E), (F) and (G) in accordance with  
24                    subsection (i),

1 (I) a description of the measures and  
2 policies to be employed by the permitting and  
3 regulatory agencies having jurisdiction within the  
4 watershed to verify and enforce subparagraphs (E),  
5 (F), (G) and (H), and

6 (J) a description of the methods to be  
7 employed within the watershed to fund subparagraphs  
8 (E), (F), (G), (H) and (I), in accordance with  
9 subsection (g).

10 (f) FAILURE TO COMPLETE WATERSHED MANAGEMENT PLANS. ---

11 In the event that a Commission fails to complete any element  
12 of the watershed management plan established by this  
13 subsection then the Administrator shall within twelve (12)  
14 months of the failure and after notice and opportunity for  
15 public comment either extend, for no more than twenty-four  
16 (24) months, the schedule for completion of any elements or  
17 employ those other Sections of this Act which are appropriate  
18 to protect water quality in the watershed. Further, if after  
19 proper notice and public comment it is determined that the  
20 Commission cannot act or chooses not to act in its capacities  
21 enumerated in this Section, then the Administrator may disband  
22 the Commission or appoint a new Commission.

23 (g) COST ALLOCATION.--- All significant sources or  
24 category of sources causing impairment of designated uses in

1 the watershed shall be required to share in an equitable  
2 manner the costs of achieving the requirements of the plan  
3 such that no source or category of sources shall be required  
4 to bear a disproportionate share of the costs of achieving the  
5 requirements of the plan, taking account of the share of the  
6 total pollutant of concern discharges affecting a given water  
7 body produced by a specific source or category of sources.

8 (h) ADOPTION OF ACTION PLANS. --- The Commission, after  
9 notice and opportunity for public comment, shall submit to the  
10 State and the Administrator the Action Plan. The State and  
11 the Administrator shall adopt the Action Plan, such plan shall  
12 not be inconsistent with or in any way less protective of the  
13 designated uses than other provisions of state and federal law  
14 respectively.

15 (i) IMPLEMENTATION AND SCHEDULES.--- The State and the  
16 Administrator shall initiate implementation of the Action  
17 Plan, including the schedules set forth therein. Actions to  
18 implement the plan for point sources shall be based upon NPDES  
19 permits issued under Section 402 as provided under subsection  
20 (k). Implementation of actions for other sources or  
21 categories of sources shall be in accordance with the  
22 authorities available to the Administrator or the State under  
23 federal or state law, including, but not limited to, Section  
24 319 of this Act.

1           (j) REVIEW OF WATER QUALITY STANDARDS AND DESIGNATED  
2 USES IN THE WATERSHED. --- The Commission shall periodically,  
3 but no less often than the periodic review of the watershed  
4 management plan, review and make recommendations to the State  
5 with respect to the establishment and revision of water  
6 quality standards, including designated uses and water quality  
7 criteria, applicable to the watershed under subsection (c) of  
8 section 303 of this Act. The Commission's recommendations  
9 shall be based upon an evaluation of the then current  
10 conditions of the water resources within the watershed  
11 including surface water quality, ground water quality,  
12 sediment conditions, habitat availability, biological  
13 resources and the degree of impairment of designated uses and  
14 upon an evaluation of the attainability of the designated uses  
15 within the watershed. The Commission shall take into account  
16 previous surveys and use attainability analyses conducted  
17 within the watershed and shall consider the technological and  
18 economic capabilities of sources or impediments to meet water  
19 quality objectives within the watershed. Baseline conditions  
20 shall be established by the Commission such that no additional  
21 significant impairment of designated uses or other biotic  
22 resources within the watershed will occur. In conducting its  
23 triennial review and revision of water quality standards under  
24 section 303(c) of this Act, the State shall ensure that such  
25 standards are consistent with the applicable watershed  
26 management plan. The Administrator shall review those  
27 recommendations adopted by the State in accordance with the

1 procedures found in Section 303(c) of this Act, and shall  
2 defer to the determinations and findings of the Commissions  
3 unless such are found, based upon the factual record, to be  
4 contrary to the requirements of this Act.

5 (k) NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM  
6 PERMITS --- The watershed management plan shall also contain  
7 recommendations to the permit issuing authority concerning the  
8 nature of revisions to the terms, conditions and schedules of  
9 compliance contained within permits issued under section 402  
10 of this Act, so as to incorporate requirements and schedules  
11 contained within the watershed plan. Where existing permits  
12 are inconsistent with the priority identification and ranking  
13 of such sources within the Plan, the permit issuing authority  
14 shall modify permits issued under section 402 to be consistent  
15 with the recommendations of the Plan. At any time during the  
16 watershed planning process permittees may petition the  
17 permitting authority to reopen and revise permit conditions.  
18 The permit issuing authority shall also take into account the  
19 information developed under subsections (e) and (g) in the  
20 revision of permits and in the exercise of any enforcement  
21 action initiated under section 309 of this Act prior to  
22 adoption of the Plan.

23 (l) PERIODIC REVIEW OF WATERSHED MANAGEMENT PLAN. ---  
24 Within five (5) years after adoption of the Action Plan, the  
25 Commission shall review the watershed management plan. The

1 watershed management plan shall subsequently be reviewed not  
2 less than every ten (10) years thereafter. Such review shall  
3 include ---

4 (1) a comparison of current sources of pollutants  
5 of concern in the watershed with those identified under  
6 paragraph (2) of subsection (e) of this section;

7 (2) an evaluation of the degree to which priority  
8 water quality concerns identified under subparagraph  
9 (5)(A) of subsection (e) of this section have been  
10 addressed and the degree to which impediments and  
11 pollutant loadings from sources, or categories of sources  
12 identified under subparagraph (5)(B) of subsection (e) of  
13 this section have been reduced;

14 (3) an evaluation of attainability for designated  
15 uses, taking into account existing factors affecting  
16 water quality in the watershed; and

17 (4) revisions, where appropriate, to the ---

18 (A) identification and ranking of priority  
19 concerns, impediments and sources under paragraph  
20 (5) of subsection (e) of this section,

1 (B) minimum standards of operation and  
2 schedules for implementation and compliance with  
3 such standards developed under this section,

4 (C) recommended changes to water quality  
5 standards and compliance schedules developed under  
6 this section,

7 (D) allocation of costs among the sources or  
8 category of sources of pollutants of concern, and

9 (E) watershed water quality and biological  
10 monitoring programs.

11 (m) GRANTS AND COOPERATIVE AGREEMENTS. --- The  
12 Administrator shall make grants to provide funds to, or enter  
13 into cooperative agreements with, States and interstate  
14 agencies designated as Commissions and with other federal  
15 agencies, to support the costs of developing and periodically  
16 reviewing watershed management plans under subsection (e) of  
17 this section. Any such grant or cooperative agreement shall  
18 not exceed 75% of the total costs of such programs.  
19 Additionally, it is the responsibility of the States in  
20 consultation with the Commissions, to establish appropriate  
21 means for sources or categories of sources to supplement the  
22 federal portion of the grant.

1           (n) COMPLIANCE WITH THE ACT. --- Nothing in this section  
2 shall be construed to relieve any source or category of  
3 sources from its obligation to comply with any other  
4 requirement imposed by this Act to the extent that it is  
5 consistent with the express provisions of this section, or  
6 with a permit issued pursuant to this Act, or with any other  
7 applicable state or federal law. Permit terms and conditions,  
8 the nature and extent of nonpoint source controls, and the  
9 scheduling of compliance and prioritizing of resources to  
10 achieve designated uses shall be guided by the watershed  
11 management plan. The scheduling of compliance and  
12 prioritization of resources to achieve designated uses shall  
13 be consistent with these watershed plans. Permitting agencies  
14 and the Administrator may exercise discretion in enforcing  
15 terms, conditions and schedules regarding requirements imposed  
16 by this Act prior to the adoption of a watershed management  
17 plan when it can be reasonably anticipated that the Plan will  
18 conclude that the existing requirements under this Act are  
19 unnecessarily stringent to achieve water quality objectives  
20 that protects the designated uses of the watershed.

21           (o) CONSISTENCY WITH STATE WATER ALLOCATIONS. --- In no  
22 event shall the provisions of this Section or of such Action  
23 Plan arising from this Section be interpreted or implemented  
24 so as to supersede, abrogate or otherwise impair the authority  
25 of each State to allocate quantities of water within its  
26 jurisdiction, nor shall it be construed to supersede or

1 abrogate rights to quantities of water which have been  
2 established by any State. Furthermore, the plan shall not be  
3 interpreted or implemented so as to in any way increase or  
4 diminish that quantity of water allocated to each State under  
5 interstate compacts or equitable apportionment decrees.

6 (p) AUTHORIZATION OF APPROPRIATIONS. --- There is  
7 authorized to be appropriated for fiscal years 1994, 1995,  
8 1996, 1997 and 1998, such sums as are necessary to carry out  
9 the purposes of this section.

10 **SEC. 4. PERMIT CONSISTENCY.**

11 The Federal Water Pollution Control Act is further amended ---

12 (a) in section 402(b)(1)(B), by inserting after the word  
13 "years," "(or in the case of discharges in watersheds  
14 designated under section 321(b), ten years)", and

15 (b) in section 402(b)(1)(C), by adding at the end of  
16 subparagraph (iii) thereof "and (iv) conforming the terms,  
17 conditions and schedules of compliance of a permit to the  
18 requirements and schedules of a watershed management plan  
19 adopted under section 321 of the Act," and

20 (c) in section 402(o)(2), by deleting the "or" at the  
21 end of paragraph (D) thereof, by changing the period at the  
22 end of paragraph (E) to a semi-colon, and by adding at the end

1        thereof "or (F) the renewed, reissued or modified permit is  
2        consistent with the provisions of a watershed management plan  
3        adopted under section 321(h) of the Act."

**COMMON QUESTIONS & ANSWERS ABOUT  
THE COMPREHENSIVE WATERSHED MANAGEMENT ACT OF 1993**

**COMMON QUESTIONS & ANSWERS ABOUT  
THE COMPREHENSIVE WATERSHED MANAGEMENT ACT OF 1993**

1) **WHY MANDATE COMPREHENSIVE WATERSHED MANAGEMENT ON A NATIONAL SCALE? CAN'T IT ALREADY BE DONE?**

Enactment of the Comprehensive Watershed Management Act of 1993 is essential for two reasons. First and foremost, to facilitate the achievement of the goal of meaningful environmental benefits from water quality improvements, and secondly to define the specific components of a comprehensive watershed management program that is national in scope -- and local in focus.

AMSA feels strongly that while the 20 years since the 1972 Clean Water Act have produced significant benefits, the future application of technology-based standards will not result in the same level of water quality improvements. Achieving tomorrow's water quality successes will be far more challenging and a change in our national "mind set" is essential.

The legislative language looks at the next 20 years of water quality improvements from a new perspective. AMSA believes this shift in our collective approach to this issue must occur. While watershed management is ongoing in some areas of the country, and certainly possible in many others, it is only a national shift in our approach to addressing water quality issues that will provide the information and tools we need to truly make a difference in our nation's water quality over the next 20 years.

2) **WHY PROPOSE A NEW SECTION 321 TO THE CLEAN WATER ACT? COULDN'T SECTION 303 SIMPLY BE AMENDED?**

Offering this legislative language as an amendment to Section 303 of the Act was considered as the drafting process was undertaken. AMSA determined, however, that a new Section 321 was more appropriate. This decision was made based upon the reasons which follow:

- The concept of comprehensive watershed management, as envisioned in the legislative language cuts across several other concepts which already exist in the Act. There are links to Section 402 permitting and Section 309 permit enforcement activities which share prominence, in our view, with the linkage to Section 303. Rather than propose amendments to all related sections, we believed a new Section 321 was more appropriate.
- Offering the legislative language as a "new" Section 321 makes it easier to focus attention and interest on the concept of comprehensive watershed

Questions & Answers  
Page -2-

management and build support for its enactment into law. Rather than refining existing provisions, Section 321 provides needed prominence and emphasizes the manner in which its provisions join together concepts already existing in the Act.

3) IS IT POSSIBLE FOR LOCAL STAKEHOLDERS TO PLAY A ROLE IN THE WATERSHED DESIGNATION AND COMMISSION APPOINTMENT PROCESS?

Flexibility was intentionally crafted into the provision addressing designation of watersheds to allow the Governor the ability to recognize past successes and existing institutions. The timing of the designation process (allowing no designations sooner than 6 months after enactment) will allow local stakeholders the opportunity to directly petition the Governor with specific recommendations for watershed designations.

AMSA envisions the same sort of active communication with the Governor will take place as appointments to the watershed management Commission are considered. Local stakeholders will have significant role on the Commissions, and special consideration should be given to those agencies within the watershed that now have, and will have, planning, implementation and enforcement responsibilities under the watershed management plan.

4) DON'T THE WATERSHED MANAGEMENT COMMISSIONS CALLED FOR IN THE LEGISLATION ADD JUST ONE MORE LAYER OF GOVERNMENT?

At first glance, the Commissions called for in the legislation could be viewed as "just another layer of government." However, AMSA would argue that it is the make-up and active participation of the Commission that makes the comprehensive watershed management concept truly effective. Today, there already exists multiple layers of local, regional, state and federal agencies with varying jurisdictional responsibilities regarding a particular watershed. Often these agencies do not meet in a coordinated and systematic way to address the policy, operational, regulatory and financial issues of a watershed. The Commission provides the setting for these agencies to meet and to systematically address problem solving for the watershed.

Comprehensive Watershed Management Act  
March 1993  
Questions & Answers  
Page -3-

The Comprehensive Watershed Management Act of 1993 is clearly a "bottoms up" approach to achieving water quality improvements. The important role of the Commission provides the basis for the difficult decisions that must be made to protect and improve the watershed, to be made by those most closely involved -- the stakeholders. It allows those who will implement the controls, to share in the decision-making process, thus eliminating one of the major problems with many of the plans prepared under Section 208 of the Act.

5) WHAT HAPPENS TO EXISTING PLANNING AGENCIES/ENTITIES UNDER THIS LEGISLATION?

As the legislation was developed, AMSA was particularly sensitive to the need to make the Commissions as inclusive as possible of all stakeholders in the watershed, while maintaining a manageable number of members. While the composition of the Commissions was made prescriptive to ensure the inclusion of key stakeholders, special consideration was given to those agencies within the watershed that now have, and will have, planning, implementation and enforcement responsibilities under the watershed management plan. Water quality planning or management panels, conferences, commissions, authorities or similar entities previously in existence or defined by statute may be designated as the "Commission" under Section 321, with the caveat that, to the extent practicable, they alter their compositions to parallel that set forth in the legislation. This will ensure continuity with existing activities within the watershed on the short term, while expanding the membership of the Commission to address new water quality protection objectives.

6) WHY DOES THE LEGISLATION UTILIZE, IN PART, DATA FROM SOURCES WITHIN THE WATERSHED IN ITS PLANNING EFFORTS?

The legislation makes a real effort to utilize valuable existing data, to the extent possible, in the development of the watershed management plans. Data from sources within the watershed can serve as a significant starting point in the assessment process. Because of regional initiatives, permit requirements, special studies or previously mandated water quality protection programs, there exists a wealth of information within some watersheds. If determined relevant and appropriate, this information should be utilized by the Commissions. The last twenty years of the Clean Water Act has resulted in the development of knowledgeable local agencies and interests that have information that can be readily available to the Commissions. Additionally, this approach saves time, money and effort -- while providing the sources with a significant role in the process at an early stage and an inherent

Comprehensive Watershed Management Act

 Questions & Answers  
 Page -4-

understanding of the baseline data which will eventually play a role in the decisions made by the Commissions.

7) WHAT RELIEF CAN POINT SOURCES ANTICIPATE FROM IMMINENT REQUIREMENTS BASED UPON WATER QUALITY IMPAIRMENTS FOR WHICH THEY ARE NOT THE SOLE OR MAJOR CAUSE?

In the legislation, progress on water quality improvements, including minimum standards of operation (MSOs), must continue as comprehensive watershed management planning moves forward. Until a watershed management plan is completed, permitting agencies that are responsible for National Pollutant Discharge Elimination System (NPDES) permits must take into account those sources within a watershed that actually cause ongoing water quality impairment and must accordingly exercise flexibility and discretion in exerting their regulatory authority in setting effluent limits and compliance schedules, and in conducting enforcement activities. For this reason, short term relief will hinge on a point source's ability to establish and maintain a close, collaborative working relationship with their permitting agency. In the long term, point sources in watersheds that have undergone this comprehensive planning process will be the benefactors of a much more balanced and equitable approach in implementing water quality controls in their watersheds.

8) WHO PAYS FOR THE IMPLEMENTATION OF WATER QUALITY IMPROVEMENTS? THE LEGISLATION SPEAKS TO THE "EQUITABLE" DISTRIBUTION OF THE COSTS -- DOES THIS MEAN IF I CONTRIBUTE 85% OF THE POLLUTANT LOAD, I PAY 85% OF THE CONTROL COSTS?

It is envisioned that all stakeholders in the watershed will be invested in both the development and the plan and its implementation. To this end the language establishes a shared distribution of the costs. The use of the word "equitable" in this provisions is not intended to mean an assignment of costs directly equivalent to each source's percentage contribution of pollutants. Instead, the intent is that cost allocations will be based upon an appropriate, fair share of the total costs as determined by the Commission. The legislation is not prescriptive as to the mechanism through which this should be established, but allow flexibility to the Commission in determining what is appropriate.

9) **HOW DOES THIS LEGISLATION APPLY TO DISCHARGERS TO EFFLUENT-DOMINATED STREAMS?**

The site-specific approach that this legislation emphasizes makes it applicable to the unique conditions of every watershed. Effluent-dominated streams are one example.

A common concern of dischargers to effluent-dominated and ephemeral streams centers around inaccurate or inappropriate designated uses and water quality standards. The Commission, through the watershed assessment process envisioned by the legislation, would be required to evaluate the water resources of the watershed and could, at its option, recommend revisions to current and projected designated uses and water quality standards of the effluent-dominated stream segments within the watershed.

Any independent effort to conduct research to provide the basis for new water quality criteria documents for effluent-dominated or ephemeral streams would be fully complimentary to, and enhanced by, the watershed management planning process. In fact, in the absence of this process, and the provisions it makes for revisions to designated uses and water quality standards, the desired changes resulting from any new criteria documents could not occur.

10) **WHY ARE THE LISTS OF "TO BE CONSIDERED" PHASE II MSOs MORE DETAILED FOR SOME SOURCES THAN FOR OTHERS?**

The "to be considered" lists of Phase II MSO were crafted to reflect the current understanding of available minimum standards of operation. For that reasons, some sources have longer lists of potential MSOs than others. The lists provided are not all inclusive or limiting. It is, in fact, anticipated that additional or different MSO will be developed during the watershed planning process.

Washington, D.C.

April 1, 1993

---

---

MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE; THANK YOU FOR THE OPPORTUNITY TO TESTIFY TODAY BEFORE THE SUBCOMMITTEE ON WATER RESOURCES AND THE ENVIRONMENT ON THE REAUTHORIZATION OF THE CLEAN WATER ACT. I AM W. REED MADDEN, CHAIRMAN OF THE BOARD OF COUNTY COMMISSIONERS OF GREENE COUNTY, OHIO, AND CHAIRMAN OF THE ENVIRONMENT, ENERGY, AND LAND USE STEERING COMMITTEE OF THE NATIONAL ASSOCIATION OF COUNTIES (NACO).\*

NACO BELIEVES THAT THE PROTECTION OF THE ENVIRONMENT AND WISE DEVELOPMENT OF OUR NATION'S RESOURCES ARE OBLIGATIONS SHARED BY CITIZENS, PRIVATE ENTERPRISE AND GOVERNMENT AT ALL LEVELS. COUNTIES HAVE THE LEGAL AND HISTORICAL RESPONSIBILITY FOR MAINTAINING AND IMPROVING THE QUALITY OF LIFE FOR THEIR CITIZENS. THIS CAN BE ACCOMPLISHED ONLY BY PLANNING FOR THE WISEST USE OF THOSE RESOURCES WHICH MAKE UP OUR ENVIRONMENT AND THEN BY IMPLEMENTING THOSE PLANS. IN MOST STATES IN THIS COUNTRY, COUNTIES AND CITIES ARE THE PRIMARY SERVICE DELIVERERS OF CLEAN WATER, AND FOR THAT REASON WE ARE ESPECIALLY AWARE OF THE IMPORTANCE OF THESE HEARINGS AS YOU BEGIN THE PROCESS OF REAUTHORIZING THE CLEAN WATER ACT.

WE FULLY SUPPORT THE GOALS OF THE CLEAN WATER ACT. THE FEDERAL GOVERNMENT, WE BELIEVE, SHOULD PLAY THE LEAD ROLE IN

\*ESTABLISHED IN 1935, THE NATIONAL ASSOCIATION OF COUNTIES IS THE ONLY NATIONAL ASSOCIATION REPRESENTING COUNTY GOVERNMENT IN THE UNITED STATES. THROUGH ITS MEMBERSHIP, URBAN, SUBURBAN, AND RURAL COUNTIES JOIN TOGETHER TO BUILD EFFECTIVE AND RESPONSIVE COUNTY GOVERNMENT. THE GOALS OF THE ORGANIZATION ARE TO: IMPROVE COUNTY GOVERNMENT; SERVE AS THE NATIONAL SPOKESPERSON FOR COUNTY GOVERNMENT; ACT AS A LIAISON BETWEEN THE NATION'S COUNTIES AND OTHER LEVELS OF GOVERNMENT; AND ACHIEVE PUBLIC UNDERSTANDING OF THE ROLE OF COUNTIES IN THE FEDERAL SYSTEM.

SETTING STANDARDS, DEVELOPING REGULATIONS, AND PROVIDING FINANCIAL ASSISTANCE TO ASSURE THE REDUCTION OF POLLUTANTS FROM OUR GROUNDWATER, AND RIVERS AND STREAMS, AND THE CONSERVATION OF OUR WATER RESOURCES. WE REALIZE, HOWEVER, THAT MORE THAN TWENTY YEARS AFTER THE PASSAGE OF THE FIRST CLEAN WATER ACT, WE STILL HAVE NOT ACHIEVED THE GOAL OF FISHABLE, SWIMMABLE WATERS THROUGHOUT THE NATION. PERHAPS IT IS TIME TO REEXAMINE THAT GOAL. GIVEN OUR LIMITED RESOURCES, IMPERFECT SCIENCE, AND NEED TO ADDRESS THE MOST SERIOUS THREATS TO OUR OVERALL ENVIRONMENT FROM A VARIETY OF SOURCES, PERHAPS WE OUGHT TO ACCEPT THE FACT THAT EVERY BODY OF WATER CANNOT, AND SHOULD NOT BE MADE FISHABLE AND SWIMMABLE.

LOCAL ELECTED OFFICIALS KNOW BETTER THAN ANYONE ELSE THAT WE MUST CONTINUE TO INVEST IN POLLUTION PREVENTION AND REMEDIATION. WE SEE FIRST HAND THE EFFECT OF ENVIRONMENTAL DEGRADATION ON OUR COMMUNITIES, AND WE FEEL THE IMPACT ON OUR BUDGETS WHEN PROPERTY VALUES ARE DIMINISHED FROM ENVIRONMENTAL DAMAGE TO LAKES AND STREAMS. BUT WE ALSO KNOW THAT THERE IS A POINT BEYOND WHICH WE WILL BREAK THE FINANCIAL BACKS OF OUR CITIZENS. THE RESULT MAY BE, AND IN SOME COMMUNITIES, HAS BEEN A SITUATION WHERE THEY SIMPLY BECOME UNWILLING TO SUPPORT THE RATES AND CHARGES THAT WE PROPOSE. IF THE PUBLIC BECOMES CONVINCED THAT MANDATED PROGRAMS THAT ARE SUPPOSED TO BE GOOD FOR US ARE NOT WORTH THE PRICE, WE LOSE THAT ENORMOUS WELL OF GOODWILL THAT HAS SUSTAINED OUR ENVIRONMENTAL CLEANUP PROGRAMS SINCE THE 1970'S. NACo'S VIEW IS THAT PRIORITIES MUST BE SET - WE SIMPLY CANNOT EXPECT LOCAL GOVERNMENTS TO RELY ENTIRELY ON THEIR OWN

LIMITED DOLLARS TO SOLVE ALL OF THE ENVIRONMENTAL PROBLEMS THAT FACE US. WE THINK THAT THERE MUST BE SOME DEGREE OF BALANCING RISKS, AND FOCUSING ON THOSE AREAS WHICH NEED ATTENTION THE MOST, THEN WORKING TOWARD OTHER LESS CRITICAL ENVIRONMENTAL OBLIGATIONS.

STATE REVOLVING LOAN PROGRAM

IF WE ARE EVER TO SOLVE OUR LONG-TERM WATER POLLUTION PROBLEMS, IT IS CLEAR THAT THE ROLE OF THE FEDERAL GOVERNMENT IN PROVIDING FUNDING FOR CONSTRUCTION OF MUNICIPAL WASTEWATER FACILITIES MUST CONTINUE AND EXPAND. THE STATE REVOLVING LOAN FUND (SRF) PROGRAM HAS BEEN SERIOUSLY UNDERFUNDED AND DOES NOT EVEN APPROACH THE CONSTRUCTION NEEDS THAT EXIST. IN ADDITION, NEW FEDERAL MANDATES SUCH AS STORMWATER REGULATIONS, COMBINED SEWER OVERFLOWS, AND NONPOINT SOURCE CONTROLS, HAVE CONTINUED TO RAIN DOWN ON COUNTIES AND CITIES, TO COMPETE FOR THE SAME DOLLARS. WHILE WE UNDERSTAND THE NEED TO BALANCE THE FEDERAL BUDGET AND REDUCE THE DEFICIT, WE ON THE LOCAL LEVEL FEEL THAT WE HAVE DONE OUR SHARE, AND THEN SOME. NACo CALLS UPON CONGRESS TO MAINTAIN THE SRF AND TO REAUTHORIZE THE PROGRAM AT AN AMOUNT NO LESS THAN \$3 BILLION PER YEAR FOR ITS IMPLEMENTATION.

WE ALSO FAVOR CHANGES IN THE PROGRAM THAT WILL ALLOW THE STATES FLEXIBILITY TO MEET THE NEEDS OF SMALLER COMMUNITIES. IN PARTICULAR, WE THINK IT IS UNNECESSARY FOR FACILITIES WHICH ARE RECEIVING SRF-FINANCED LOANS TO HAVE TO MEET THE SAME REQUIREMENTS THAT ARE PLACED ON GRANT RECIPIENTS. SMALL COUNTIES AND SEWER DISTRICTS OFTENTIMES LACK THE STAFF RESOURCES AND

ADMINISTRATIVE SOPHISTICATION TO COMPLY WITH THE BURDENSOME TASK OF APPLYING FOR A STATE REVOLVING LOAN. THEREFORE THEY FOREGO THE OPPORTUNITY TO GET ASSISTANCE FOR THEIR NEEDS.

WE URGE THAT THE RESTRICTION ON THE USE OF SRF MONIES TO PAY FOR THE COSTS OF LAND AND RIGHTS OF WAY ASSOCIATED WITH FACILITY CONSTRUCTION BE ELIMINATED. RURAL COUNTIES FREQUENTLY HAVE TO INSTALL COLLECTOR OR INTERCEPTOR SYSTEMS OVER LONG DISTANCES TO SERVE LIGHTLY POPULATED AREAS. MAJOR LAND PURCHASES ARE NECESSARILY PART OF THE PROJECT. IMPROVEMENTS IN THE ADMINISTRATION OF THE SRF PROGRAM AS SUGGESTED WILL INCREASE THE CHANCES THAT SMALLER GOVERNMENTS WILL BE ABLE TO OBTAIN AN SRF LOAN, AND BEGIN TO PROVIDE SOME EQUITY TO THE SYSTEM.

#### GRANTS

THERE WILL ALWAYS SOME SITUATIONS IN WHICH THE SRF IS SIMPLY NOT ADEQUATE TO THE TASK OF ADDRESSING OUR SERIOUS WATER QUALITY CONSTRUCTION NEEDS. IN THE CASE OF SMALL RURAL COMMUNITIES OR DISTRESSED COMMUNITIES, IT WILL BE IMPOSSIBLE UNDER ALMOST ANY SET OF CIRCUMSTANCES TO REPAY A LOAN. NACo SUPPORTS THE CONCEPT OF GIVING THE STATES MORE FLEXIBILITY TO SERVE THE NEEDS OF THESE COMMUNITIES, AND TO CONSIDER A SET-ASIDE OR A SEPARATE PROGRAM FOR SPECIAL CIRCUMSTANCES.

AT THIS TIME, WE ARE NOT PREPARED TO SUGGEST TO YOU AN ON-GOING REVENUE SOURCE FOR FUNDING A GRANTS PROGRAM OR AN EXPANDED LOAN PROGRAM, BUT WE REALIZE THAT A DEDICATED SOURCE OF MONIES IS CRITICAL TO WATER QUALITY IMPROVEMENT. WE WILL BE EXAMINING THE IDEAS THAT ARE BEING CONSIDERED, AND WILL BE HAPPY TO PROVIDE

THE COMMITTEE WITH OUR POSITION WHEN IT IS FINALIZED.

#### WETLANDS

NACo SUPPORTED THE REVISION OF THE 1989 WETLANDS MANUAL BECAUSE WE BELIEVED THAT IT WOULD RESULT IN A LESS COSTLY WETLANDS ENFORCEMENT POLICY. WE STILL THINK THAT CHANGES ARE NEEDED IN THE FOLLOWING AREAS: DESIGNATING A LEAD AGENCY; A DEFINITIVE DEFINITION OF WETLANDS IN UNIQUE SETTINGS; AND A DISTINCTION BETWEEN HISTORIC NATURAL WETLANDS AND ARTIFICIALLY CREATED WETLANDS.

ONE FEDERAL AGENCY NEEDS TO TAKE THE LEAD IN WETLANDS POLICY AND REGULATION ENFORCEMENT. ANSWERING TO FOUR SEPARATE AGENCIES, EACH WITH DIFFERENT GOALS AND ENFORCEMENT METHODS, SEVERELY HAMPERS SOUND WETLANDS CONTROL. THIS PROCESS DRASTICALLY INCREASES THE TIME PERIOD AND THE EXPENSE TO BOTH CITIZENS AND LOCAL GOVERNMENTS. THE CURRENT PERMITTING PROCESS IS TOO TIME CONSUMING AND NEEDS TO BE EXPIDITED. THE CORPS OF ENGINEERS, WHETHER OR NOT IT IS DETERMINED TO BE THE LEAD AGENCY, SHOULD HAVE AN APPEALS PROCESS FOR PERMIT DENIALS.

THERE IS A NEED FOR DEFINITIVE LANGUAGE ON THE DEFINITION OF WETLANDS IN UNIQUE SETTINGS. SPECIFICALLY, PERMAFROST AND OTHER CONDITIONS EXCLUSIVE TO ALASKA NEED TO BE ADDRESSED. ADDITIONALLY, THERE SHOULD BE NO INTERSTATE MITIGATION BANKING.

MOST IMPORTANTLY, A CLEAR DISTINCTION BETWEEN HISTORIC, NATURAL WETLANDS AND DISTURBED OR ARTIFICIALLY CREATED WETLANDS NEEDS TO BE MADE. LAND THAT HAS BEEN IDENTIFIED AS WETLANDS

THROUGH THE CREATION OF HIGHWAYS, DAMS, IRRIGATION, ETC., SHOULD NOT BE PROHIBITED FROM BEING DRAINED. TO CLASSIFY SUCH AREAS AS WETLANDS ONLY CREATES NEW PROBLEMS AND LARGE EXPENSE TO LOCAL GOVERNMENT.

WATERSHED-BASED WATER MANAGEMENT

NACo AGREES IN CONCEPT THAT WATERSHED BASED MANAGEMENT PROVIDES A NUMBER OF BENEFITS IN DEVELOPING A COMPREHENSIVE APPROACH TO ENVIRONMENTAL PROTECTION. OUR STEERING COMMITTEE WILL BE REVIEWING IN SOME DETAIL THE VARIOUS PRINCIPLES AND PROPOSALS PUT FORTH BY PROFESSIONAL ASSOCIATIONS AND OTHERS, AND WILL ULTIMATELY DEVELOP OUR POSITIONS. WE WOULD LIKE TO REQUEST AN OPPORTUNITY TO SUBMIT OUR RECOMMENDATIONS TO YOU WHEN THEY HAVE BEEN APPROVED BY NACo'S BOARD OF DIRECTORS.

WE WANT TO BRING TO YOUR ATTENTION, HOWEVER, TWO POINTS THAT WE HOPE WILL BE KEPT IN MIND IN THE DISCUSSION. FIRST IS THE ISSUE OF LAND USE CONTROL BY LOCAL GOVERNMENTS. COUNTIES HOLD VERY DEAR THE ABILITY TO DETERMINE THE BEST USE OF LAND WITHIN THEIR BOUNDARIES. IT IS THE ELECTED OFFICIALS WHO MUST "OFFICIATE" AT THOSE CONTENTIOUS ZONING HEARINGS WHEN CITIZENS OBJECT TO USE OF THEIR PROPERTY BEING LIMITED BY GOVERNMENTAL REGULATIONS. IT IS THE LOCAL OFFICIALS WHO GET THE CALLS AT 10:00 AT NIGHT FROM ANGRY FARMERS WHO HAVE BEEN TOLD THAT THEY CAN'T CULTIVATE UP TO THEIR PROPERTY LINE. WHILE WE AGREE THAT THERE ARE NECESSARY RESTRICTIONS ON THE USE OF PRIVATE PROPERTY FOR ENVIRONMENTAL PROTECTION, WE WANT TO BE INTIMATELY INVOLVED IN DEVELOPING THOSE RESTRICTIONS, BECAUSE WE WILL CERTAINLY BE

BLAMED FOR THEM.

SECONDLY, WE ARE CONCERNED THAT COUNTY BOUNDARY LINES AND ELECTED COUNTY OFFICIALS MIGHT BE ARBITRARILY DISREGARDED IN ORGANIZING WATERSHED DECISIONMAKING AGENCIES OR COMMITTEES. WE URGE YOU TO REMEMBER THAT COUNTIES HAVE BEEN ORGANIZED IN MOST STATES IN THIS COUNTRY SINCE THE 1800'S AND HAVE LONG HISTORIES OF CROSS-COUNTY OR MULTI-COUNTY COOPERATION. WE WOULD NOT LOOK VERY FAVORABLY UPON FEDERAL OR STATE-IMPOSED ENTITIES WHOSE BOARDS WERE APPOINTED BY ANOTHER LEVEL OF GOVERNMENT, OR BOARDS ON WHICH WE WERE NOT REPRESENTED. LOCAL DECISIONMAKING IS THE KEYSTONE OF NACO'S PHILOSOPHY, AND WE HOPE THAT ANY SPECIFIC PROPOSALS ON WATERSHED MANAGEMENT WILL HAVE A STRONG LOCAL COMPONENT.

THANK YOU FOR THE OPPORTUNITY TO EXPRESS OUR OPINIONS.

**Statement of Scott Tucker  
on behalf of the  
National Association of Flood and Stormwater Management Agencies  
before the  
Subcommittee on Water Resources and Environment  
House Committee on Public Works and Transportation  
on the  
Reauthorization of the Federal Water Pollution Control Act  
April 1, 1993**

### **Introduction**

Mr. Chairman, my name is Scott Tucker, and I am Executive Director of the Urban Drainage and Flood Control District in Denver, Colorado. The District provides both flood control and stormwater management services for the Denver metropolitan area, serving approximately 1,800,000 citizens in 30 municipalities and six counties.

Today I am appearing on behalf of the National Association of Flood and Stormwater Management Agencies (NAFSMA), a national organization representing 50 flood control and stormwater agencies serving a total population of more than 50 million citizens. I now serve as Chairman of the organization's Stormwater Committee and as a member of the Board of Directors.

### **Overview**

The Water Quality Act of 1987 established an approach for the permitting of municipal stormwater discharges for the nation's larger cities and counties that is now fully in place and moving forward on the schedule set forth in U.S. EPA's November 1990 regulations. Next month approximately 200 communities serving a substantial portion of urban America will have filed applications for systemwide National Pollutant Discharge Elimination System (NPDES) permits, representing a major milestone in what will be a long term effort to address urban stormwater runoff.

Mr. Chairman, I am pleased to report that these larger communities have been both timely and earnest in responding to this federal directive. More importantly, despite considerable uncertainty, continuing local resource constraints and the revenue effects of a lingering recession, the initial commitment of local resources has been substantial. Total permit application costs, according to a NAFSMA survey of cities and counties to be permitted, are estimated at \$130 - \$140 million. This survey also points out that the costs of permit applications are much higher than this estimate when the jurisdictions with early permits and the smaller communities that joined with larger, listed jurisdictions in areawide or joint applications, are included.

Mr. Chairman, a legislator who shaped the 1987 requirements for municipal systems emphasized that the permits for municipal separate stormwater systems would not be permits in the traditional sense but were to be "programs." We strongly agree with this view and would add that the programs and measures that municipalities must develop to control pollutants conveyed by municipal systems are new programs and unfortunately at this time, we do not know how to measure their performance or

effectiveness. In short, the nation's larger cities and counties are now charting the course, using the NPDES permit program as the means into the complex issues of non-point pollution, specifically urban stormwater runoff. We are at the front of the line in discovering the level to which our citizens and institutions are willing to make the required adjustments in the way we live and work. The irony of this circumstance is that, in spite of this massive local effort, there is little known about the ultimate effectiveness of this endeavor.

The success of this effort over the near term will depend on the creativity and consensus-building of our local communities, supported by our technical and elected leadership, and their ability to direct massive new financial resources into stormwater systems. Over the longer-term, the level of support and commitment that you and others at the federal and state levels provide will be a critical determining factor in achieving the most significant improvements in the nation's stormwater quality.

All of us have an opportunity with the new Administration and Congress to re-examine how we approach stormwater quality management in addressing non-point pollution. This examination is possible because of the experience of our local efforts, which are still in their infancy despite the substantial commitment of local resources by the medium and larger systems.

Our experiences have shown what we believe is the most significant deficiency in the design of this federal initiative directing larger communities to seek permits for their stormwater systems. The municipal stormwater provisions have created an expectation that now pervades the system that these are our pipes and therefore our pollutants. The 1987 Act did not set forth a parallel agenda for the federal government and/or the states to begin reviewing actions and measures to support a broad-based reduction in the sources and availability of pollutants that find their way into municipal storm drains. In short, if this is a national problem, we see little evidence of any federal and state leadership backing our efforts.

More advanced local programs are now documenting the contributions of the automobile, impacts of air pollution, and a vast array of household and commercial chemical uses. In exercising authorities vested in Washington and in our state capitals, which we do not control, our systems are vulnerable, and under the Clean Water Act, accountable, for sources that heretofore had been viewed as unrelated issues before this Committee, throughout the Congress and within federal and state agencies. In short, Mr. Chairman, we know treatment facilities will not work and we know that controlling the sources is what this program must be about. We need a higher level of national leadership that places the federal government, in its policies and actions, on a course to do its part. In many areas, you are the only level of government that can effectively help us control what passes through our stormwater systems. Setting up an expectation that we own the system and therefore we remove the pollutants by treatment places local taxpayers, your constituents, in the position of underwriting relief, either acknowledged or unintended, to generators of pollutants who can more readily and more cost-effectively be controlled through federal or state actions.

The absence of any clear role for our federal and state partners, other than telling us to get the lead out, goes to the heart of our request to this Committee. We are seeking Congressional action addressing the use of water quality standards in the municipal

stormwater program. The application of water quality-based numerical permit limits by its very nature will force us to fail and be punished for non-compliance. This issue was raised two years ago by NAFSMA and others; it is now time to take action on Clean Water Act amendments to deal with this issue.

At the same time, Mr. Chairman, our members are confident that an assessment of the current record of our local performance will show that communities are proceeding with earnest and cost-effective programs to do our part, responding to a federal directive to address yet ill-defined water quality impacts from urban stormwater runoff.

We already know that treatment of municipal stormwater is too expensive and, even if resources were unlimited, we know that in the end we would not achieve the results that all of us are seeking. We know, and most everyone agrees, that the application of water quality standards, as traditionally expressed in numeric limits, will not work for municipal stormwater. If U.S. EPA won't tell you for fear of being perceived as lacking a commitment to water quality objectives, we can tell you that as a nation we are not ready to move beyond the current Phase I of the stormwater program, primarily because of the lack of knowledge about the costs and benefits of the program and federal resource constraints, both technical and financial.

Unless the unique limitations associated with the management of urban stormwater quality are recognized through amendments to the stormwater provisions of the Clean Water Act, local governments will be overwhelmed by the costs of pursuing such standards. The Southern California Chapter of the American Public Works Association (APWA) reported in May 1992 that capital costs to implement this mandate could range from \$147 million to \$406.7 billion depending on the level of effort required. Their estimates of annual O & M costs ranged from \$1.16 billion to \$542 billion. If municipal systems are held to numeric permit limits, it would be necessary to treat stormwater and the associated costs would be at or near the top of APWA's range. The City of Sacramento estimated that it would cost about \$2 billion for an area of about 900,000 people to implement a treatment option intended to meet standards. They concluded, however, that even with this option some standards would be exceeded.

This experience in California has led to the establishment of the California Stormwater Quality Task Force and its work on a comprehensive package of Clean Water Act amendment recommendations. Doug Harrison, who chaired this working group, will be reviewing the elements of this proposal with the Committee during this hearing. NAFSMA believes this proposal largely addresses the principles that I will now present.

#### **Recommendations on New Clean Water Act Amendments**

Given the work completed and the momentum generated by the some 200 cities and counties, we are not suggesting that the program be abandoned. We are concerned, however, about the future of the effort and have the following recommendations from our membership.

## I. Point vs. Non-Point Sources

There is a need to emphasize more definitively in the Act that municipal stormwater systems convey, not create, pollutants, that are generated by many different sources. As such, municipal separate stormwater systems are more like non-point pollution sources than traditional point sources. The matter of placement of municipal stormwater in Section 402 in the Clean Water Act reinforces inappropriate and unworkable linkages to other CWA requirements developed for point sources that over time may be extended to municipal separate stormwater system permits, rather than emphasizing the non-point nature of this problem and the appropriate control measures (i.e. management practices).

Short of massive engineering solutions involving costly detention and treatment of municipal stormwater to comparable levels for point sources, the remedies for pollution carried by municipal stormwater systems will rely on programs for source control, pollution prevention, improved public and private management practices, education and the like. These activities represent the most appropriate and cost-effective methods of addressing municipal stormwater discharges for the foreseeable future. Such measures are similarly applied in addressing non-point pollution problems that are currently supported under Clean Water Act programs.

**Position:** New amendments should redefine municipal stormwater permit requirements, separating this category of NPDES permits from current law linkages and requirements for NPDES-permitted point sources.

Moreover, establishing municipal stormwater as a distinct category of the NPDES permit program does not preclude or limit the implementation of appropriate water quality standards (WQS) to protect beneficial uses.

## II. Water Quality Standards (WQS) & Maximum Extent Practicable (MEP) Standard

NAFSMA members rightly assert that compliance with all existing WQS in every storm event cannot be achieved in the municipal program. Clarification of water quality standards and objectives as applied to municipal stormwater is needed to account for the substantial geographic variability and differences between municipal separate stormwater systems and traditional waste water and industrial effluent sources.

Existing NPDES permit application requirements for municipal systemwide permits provide permittees and permit-writers with an opportunity to develop locally- and regionally-specific permit requirements under the Maximum Extent Practicable (MEP) standard to address water quality problems attributable to municipal stormwater discharges. New Clean Water Act amendments further defining MEP should account for substantial progress, including level of effort, local expenditures and assessments of local stormwater impacts which have been or will be achieved under current law and regulations. In addition, such CWA amendment proposals should recognize that permit applications, the resulting permits and compliance efforts will further define and implement the MEP standard.

**Position:** NAFSMA members intend to move forward with reasonable and fiscally sound programs, including best management practices and other pollution prevention measures, to address urban stormwater impacts on receiving waters.

NAFSMA urges adoption of a longer-term federal strategy to develop new water quality objectives for municipal stormwater runoff that are appropriate to identified water quality impacts on designated uses, properly account for urban stormwater and are technologically-achievable and financially responsible. Existing water quality standards can be used in the interim to measure progress of municipal stormwater permits and programs, while compliance under the Maximum Extent Practicable (MEP) standard is measured by performance of the practices specified in the permits.

### III. Industrial Facilities

Under existing regulations, local governments with large separate stormwater systems must submit separate applications for NPDES stormwater permits for all designated "industrial" facilities that they own or operate, while at the same time they must also apply for systemwide NPDES permits.

There is interest among some municipalities and regulators in having local agencies provide additional regulatory support to the efforts to control discharges associated with industrial facilities, recognizing that these functions are now properly assigned to state and federal permit and compliance personnel.

**Position:** NAFSMA supports legislative or regulatory changes to provide a process allowing a local government, at its discretion, to include stormwater discharges for municipal facilities (current regulations defined certain facilities owned or operated by the local government as industrial facilities) in its systemwide NPDES permit.

In addition, NAFSMA supports changes in current law to allow, but not require under any circumstances, federal and state agencies to transfer regulatory responsibilities to municipal permittees for "industrial facilities" within their service areas.

### IV. EPA/State Research and Technical Assistance Capabilities

NAFSMA is concerned about the lack of technical and outreach capacity to assist municipal applicants in designing and implementing cost-effective programs and measures to address municipal stormwater discharges. For example, during the application preparation phase of this program, regulations requiring monitoring programs were not well conceived and have resulted in substantial local expenditures for results of limited value to the regulatory agencies and local agencies.

NAFSMA believes that resources are needed to strengthen the technical and programmatic capabilities of EPA and the states to help ensure timely and cost-effective implementation of control measures by regulated municipal systems.

NAFSMA is also concerned that the limited resources now allocated to federal and state agencies for research, technical assistance and other related information exchange functions cannot adequately support an expanding municipal stormwater program in all of the hydrologic regions of the country. Moreover, even the basic information dissemination efforts (e.g. copying and mailing documents, development of case studies to disseminate information on local programs, etc.) are very limited.

**Position:** NAFSMA supports the establishment of a separate authorization to fund new studies, pilot grants to communities, direct technical assistance to communities, clearinghouse and database functions for information-sharing, further research and effective technical development activities in cooperation with state and local governments in similar geographic/hydrologic regions.

#### **V. Smaller Communities and Other Phase II Sources**

NAFSMA believes that we are not ready to proceed with an expansion of the stormwater program beyond the sources that are presently subject to permit requirements. Current law authorizes U.S. EPA and the states to require NPDES permits for Phase II sources where water quality problems exist. This authority has already been exercised on numerous occasions, to address discharges from Phase II sources, such as smaller communities and currently unregulated industries. As representatives of many of the communities already subject to municipal permit requirements, we feel it is crucial that we gain more experience and knowledge before we move forward with an expanded program. This Committee is urged to pursue a full discussion with U.S. EPA and state administrators on the implications of moving forward at this time beyond the Phase I sources.

**Position:** NAFSMA supports a deferral of further regulation of the Phase II sources (except in individual cases where federal and/or state administrators require a permit under existing law) until such time as the federal and state regulatory systems are capable of assuming this substantial responsibility and can develop regulatory requirements based on the experiences of the Phase I program.

#### **Recommendations for Other Related Federal Actions**

Mr. Chairman, we would also recommend that this Committee begin developing an active federal agenda to support local program efforts, recognizing that some of the following recommendations will have to be addressed over time. Specifically, we urge the following:

- 1) Congress should direct the appropriate federal agencies, such as the Office of Technology Assessment, to undertake additional studies defining federal policy options to control or eliminate pollutants now present in urban stormwater and amenable to federal policy or legislative action. One example has been identified in the results of local site specific studies that link copper problems largely with brake linings. If these

results are confirmed by other studies and Congress doesn't intend to get copper out of brake linings, then local agencies should not be held accountable for copper either.

2) Congress should direct that federal facilities – buildings, facilities and other operations – comply with local stormwater management program requirements or require that such federal facilities develop a program that produces comparable results as would have been achieved under the local program.

3) Congress should direct federal facilities to pay their fair share of the costs of local programs and controls by complying with local user charges and other assessments that directly finance local stormwater programs.

4) Congress should strive for consistency in other programs and statutes where federal policies will affect negatively the efforts of local agencies to improve stormwater quality. For example, this Committee also authorizes all federal highway activities which need to be adjusted to reflect more fully stormwater quality objectives. During the last Congress, legislation was approved by another House committee pre-empting all local regulation of pesticide use.

### **Conclusion**

In conclusion, let me emphasize the following.

First, a significant effort is already underway by the larger cities and counties to reduce the pollution carried by larger municipal separate stormwater systems. As an indication of the level of efforts, over \$130 million was spent by cities and counties to prepare applications. Much more will be invested by these jurisdictions to comply with permit requirements.

Second, Congress should clarify that water quality-based limits, including numerical limits, should not be used in the municipal permit program to measure permit compliance. Instead, compliance should be based on permittee performance of the practices specified in the permits.

Third, we urge that the federal government and states commit the political, financial and technical resources to adequately support local efforts. Local governments alone will not be able to achieve the results that all of us are seeking.

Mr. Chairman, I thank the Committee for this opportunity to share the views of NAFSMA on the Clean Water Act reauthorization.

## PREFACE

In February 1992 the National Association of Flood and Stormwater Management Agencies (NAFSMA) initiated a survey of the nation's larger cities and counties to document the costs of filing permit applications for their municipal separate storm sewer system discharges. Approximately 200 of the nation's larger cities and counties in 42 states and other selected jurisdictions across the country are now preparing applications for National Pollutant Discharge Elimination System (NPDES) permits pursuant to provisions of the "Water Quality Act of 1987" and U.S. EPA's subsequent November 16, 1990 implementing regulations.

The findings of this report underscore the significant costs, level and timeliness of the efforts undertaken by the nation's larger cities and counties in preparing applications for NPDES permits. These jurisdictions are now developing, and in numerous instances are already implementing, elements of a systemwide stormwater management program that will be described fully in Part 2 of the permit application, which will be filed in November 1992 by the largest systems and in May 1993 by the medium-size systems. Federal and state permit-writers will evaluate these submittals in developing final permit requirements to be implemented during the initial five-year term of these permits.

This report is the first of several planned NAFSMA reports to provide reliable and complete information for policy-makers on the cost impacts of federally-established requirements governing municipal separate stormwater system discharges to the nation's waters.

The next report, which is planned for early 1993, will assemble preliminary cost estimates on NPDES permit compliance and will also provide more complete cost data on permit applications, the subject of this first report.

NAFSMA expresses its gratitude to its member agencies and the other non-member cities and counties participating in this survey for the information and support that made this report possible.

L. Scott Tucker  
Chairman, NAFSMA Stormwater Committee  
Executive Director  
Denver Urban Drainage and Flood Control District

## **SIGNIFICANT FINDINGS**

Cities and counties with municipal separate storm sewer systems serving populations over 100,000 are spending an estimated \$130-140 million to prepare applications for NPDES permits. This estimate is based on the results of a recent survey conducted by the National Association of Flood and Stormwater Management Agencies (NAFSMA). Approximately 180 cities and counties are required under present regulations to submit National Pollutant Discharge Elimination System (NPDES) permit applications for their municipal separate storm sewer systems. These costs do not reflect the many other local governments with a population of less than 100,000 that are joining with these cities and counties as copermitees.

The survey results demonstrate the significant costs to cities and counties and the level of effort they are making to comply in a timely manner with the federal mandate to apply for NPDES permits for their separate municipal storm sewer systems.

## **MUNICIPAL SEPARATE STORM SEWER PERMIT PROGRAM**

In 1987 Congress successfully enacted amendments to the Clean Water Act (Water Quality Act of 1987) setting forth a new permitting process for discharges by Municipal Separate Storm Sewer Systems (MS4s). These amendments:

- established a tiered program (based on population thresholds) for phasing in new requirements for city and county separate storm sewer systems;
- authorized the issuance of a single, systemwide permit for the discharges from each system; and
- set a new standard of permit compliance, known as the MEP (maximum extent practicable) standard, emphasizing best management practices (BMPs).

On November 16, 1990, U.S. EPA issued final regulations covering permit application requirements for the 173 cities and 47 counties that were presumed to own/operate separate storm sewer systems serving a population of 100,000 or more. The regulations set forth a comprehensive description of issues and specific requirements that cities and counties must consider and satisfy in preparing an application for a systemwide permit. The survey results discussed in this report provide specific information and cost estimates for the cities and counties now preparing these applications.

Subsequent to the promulgation of these regulations, there is considerable debate and uncertainty within the regulated community of cities and counties, among federal and state policy-makers and within the Congress on how water quality standards, including the associated limits (i.e. numerical effluent limits), apply to municipal separate stormwater system permits.

Cities and counties are now preparing applications for National Pollutant Discharge Elimination System (NPDES) permits, a permit system that heretofore has been used to regulate traditional point sources, such as discharges from municipal wastewater treatment systems and industrial facilities.

U.S. EPA's November 1990 regulation required the listed cities and counties to submit a two-part permit application. The deadlines for Part 1 filings have passed. Cities and counties with a separate storm sewer system serving a population of 250,000 or more (large system) were to have filed Part 1 by November 18, 1991. Cities and counties with a system serving a population of 100,000 - 250,000 (medium system) were to have filed Part 1 by May 18, 1992.

The final phase of the application process concludes with the Part 2 filings. Large systems must file Part 2 on or before November 16, 1992, and medium systems must file on or before May 17, 1993.

## SCOPE OF SURVEY

This survey was designed to document the actual (where available) or the estimated costs of preparing Parts 1 and 2 of the permit application by the cities and counties with separate storm sewer systems serving more than 100,000 people. In securing this permit application cost information, the questionnaire also requested information, including actual and anticipated filing dates for Part 1 and Part 2, joint application data, funding sources, and permit compliance cost estimates. A copy of the survey instrument is provided in this report (pages 31-32).

Beginning in February 1992 questionnaires were mailed to officials in the 220 jurisdictions that were listed in the November 1990 regulation. As of June 12, more than 115 questionnaires were received by the NAFSMA National Office. The findings of this report are based on responses from 101 jurisdictions - 75 cities, 25 counties and 1 joint city/county application - that provided partial or complete application cost information.

The sample size is significant in that it represents more than 55 percent of the affected jurisdictions. While the regulations list 220 jurisdictions, this report concludes that approximately 180 of these jurisdictions will actually seek permits under these regulations. The following adjustments, based on contacts with the listed jurisdictions and other information, were made to the sample universe:

- More than 15 designated jurisdictions are already operating under "early permits" issued in the States of California and Nevada and therefore application costs for these jurisdictions are not included in this report.
- More than 16 jurisdictions that were contacted had already sought an exemption or were seeking an exemption on the basis of population errors or the presence of combined sewer overflows (CSO's) such that the jurisdiction does not meet the statutory application threshold (i.e. a separate storm sewer system serving 100,000 or more).

A listing of the 101 jurisdictions that are included in the survey results is provided in Table 2. The 75 cities, 25 counties and 1 joint city/county agency represent 36 of the 42 states with systems affected by the initial phase of the municipal separate stormwater permit program.

## PERMIT APPLICATION COSTS

Tables 1-5 provide information on Part 1 costs, Part 2 costs and Total Application costs.

More than 95 percent of the respondents provided information of Part 1 costs and more than 82 percent of the respondents provided information on Part 2 costs, 89 percent of the respondents provided information on Total Application costs.

### Key Findings:

- 90 respondents representing a balance of large and medium systems estimated total application costs of \$68.5 million.
- Average cost of a single permit application is \$761,000 for the full, two-part application.
- Total permit application costs for the approximately 180 affected cities and counties are estimated at \$130-140 million.
- Numerous respondents indicated that their application costs estimates were lower than actual costs (e.g. prior work, staff effort and planning not accounted for).

The total application costs for all jurisdictions now operating under these regulations are expected to be much higher. As noted above, the estimate of \$130 - 140 million in application costs for approximately 180 of the larger cities and counties does not reflect the expenditures by other local governments below the 100,000 population threshold.

Nearly one-third of the respondents (30) indicated that their jurisdictions were participating with others as copermittees in a regional municipal permit program. These 30 large or medium systems are joining with 290 other local governments, regional agencies and in several cases with state departments of transportation in seeking a permit on an areawide or regional basis. These respondents were also asked to list major jurisdictions that were participating in a joint or areawide permit. In almost every case, the cities and counties noted as coapplicants were below the 100,000 population threshold. The costs of preparing these applications are not included in the application costs presented in this report.

## TIMELINESS OF APPLICATION FILINGS

Of the 59 cities listed as large systems by EPA, survey responses from 25 of these systems indicated that all but one had filed their Part 1 application on or before the November 18, 1991 deadline. Of the 114 listed medium systems, survey responses from 50 cities in this category indicated that all but one had filed Part 1 on or before the May 18, 1992 deadline.

Questioned on anticipated filing dates for Part 2, 22 of 25 large cities expected to file by the November 16, 1992 deadline, with the remaining three cities planning to file by the Part 2 filing deadline for medium systems. For medium system cities, 47 of 50 expected to file Part 2 by the May 17, 1993 deadline, with three cities providing no anticipated filing date.

### Key Findings:

- Despite U.S. EPA's delay in issuing the final implementing regulations, large and medium municipal systems are complying in a timely manner with the filing deadlines as set forth in these regulations. In submitting Part 1 applications, for example, 73 of the 75 cities filed on or before the deadline.
- The regulatory program for large and medium municipal separate stormwater systems is the only aspect of the federal stormwater regulatory program that has not been modified since the November 16, 1990 regulations were released. During 1991, for example, the industrial facility permit requirements were the subject of two separate U.S. EPA rulemakings and two Congressional actions.
- Large and medium systems have remained on schedule despite continuing delays by U.S. EPA in issuing technical and program support guidance. The key guidance document to be used by large and medium communities in preparing the Part 2 of their applications is due out this summer; large communities are moving forward without the benefit of this guidance document in order to keep on schedule with the November Part 2 filing deadline.

## FUNDING SOURCES FOR PART 1

Respondents were asked to provide information on sources of funding for Part 1 of their applications. Table 6 provides a listing of these fund sources. While the general fund is the dominant source of revenues for most jurisdictions, there is considerable diversity in financing Part 1 application costs.

## PERMIT COMPLIANCE ESTIMATES

All respondents were asked to estimate permit compliance costs. Only 16 of the 101 responses provided any projections on anticipated permit compliance costs. From these responses it is clear that future costs of permit compliance can be expected to be substantially higher than the permit application costs. Since these estimates are quite preliminary, these responses are not provided in this report. In preparing Part 2 of the permit application, jurisdictions are required to prepare a permit compliance estimate. NAFSMA will conduct future survey work in this area.

When asked to identify sources of funding for compliance, 57 respondents had not identified sources at this time, 26 indicated that new revenues would have to be generated and 18 planned to use existing revenues. Of the 16 respondents providing cost estimates, half indicated new revenues would be needed and half planned to utilize existing revenues.

## NOTES ON REPORT AND FINDINGS

In reviewing the attached survey responses, please note the following:

- Counties were not grouped in population categories due to uncertainty over unincorporated populations and the nature of the separate system serving such populations.
- Cities in this report were listed in population categories (i.e. 250,000 or more; 100,000 - 250,000) based on population data provided by the respondent. Therefore, the listings of these cities by population in the following tables do not correspond with U.S. EPA's listings (large and medium) that were set forth in the November 16, 1990 regulation.
- The use of an average permit application cost figures does distort to some degree the actual cost per individual permit application. The use of these average cost figures obviously casts considerable doubt on U.S. EPA's published application (Parts 1 and 2) cost estimates of approximately \$75,000 for large systems and approximately \$50,000 for medium systems.
- This survey effort did not include cities and counties that will meet the population threshold (i.e. more than 100,000) as a result of the 1990 census. When these cities and counties are listed by U.S. EPA and initiate permit applications, the initial group of large and medium jurisdictions operating under these requirements will again total more than 200.

NAFSMA SURVEY RESULTS: SUMMARY TABLE -- Application Costs

	Cities (over 250,000)	Cities (100-250,000)	Counties (over 100,000)	Other (joint applic.)	All Respondents
<u>PART 1</u>					
Population:	19,080,736	6,463,280	9,713,235	665,000	35,922,251
Costs:	\$11,743,018	\$8,953,263	\$5,644,009	\$215,000	\$26,555,290
Respondents:	32	40	23	1	96
Average Cost:	\$370,000	\$224,000	\$246,400	\$215,000	\$276,600
<u>PART 2</u>					
Population:	16,120,736	5,309,499	9,144,235	665,000	31,239,470
Costs:	\$16,071,909	\$13,456,938	\$9,405,483	\$450,000	\$39,384,330
Respondents:	30	32	20	1	83
Average Cost:	\$535,700	\$420,500	\$470,300	\$450,000	\$474,500
<u>FULL APPLICATION</u>					
Population:	16,683,736	5,670,499	9,635,235	665,000	32,654,470
Costs:	\$28,582,927	\$22,174,919	\$17,067,915	\$665,000	\$68,490,761
Respondents:	32	35	22	1	90
Average Cost:	\$893,000	\$663,600	\$775,800	\$665,000	\$761,000

-- FULL APPLICATION costs include respondents that provided both Part 1 and Part 2 estimates as well as those that provided a Total\*\* application cost estimate (shown with footnote 2 in accompanying tables).

-- Other column refers to the joint application by the Louisville & Jefferson County Metropolitan Sewer District, the administering agency for the City of Louisville and Jefferson County.

APPLICATION COSTS CONTINUED

	<u>Population*</u>	<u>Part 1</u>	<u>Part 2</u>	<u>Total</u>	<u>Total**</u>
Total Population - 101 respondents:	37,176,251				
Total Part 1 Costs - 96 respondents:		\$26,555,290			
Total Part 2 Costs - 83 respondents:			\$39,384,690		
Total Application Costs - 83 respondents:				\$62,927,356	
Total** Application Costs - 8 respondents:					\$6,970,791

\* Respondents generally assigned populations using available data (1980 or 1990 census) and in several cases figures are estimates of population served by the separate systems, not the actual city or county population.

\*\* Amounts are total application cost estimates where the respondent did not provide separate Part 1 and Part 2 estimates or the respondent provided a total application cost estimate that is higher than the sum of Parts 1 and 2.

- 1 Amounts are included in Total Part 1 Costs but are excluded in Total Application Costs.
- 2 Amounts are included in Total Application Cost estimates in Table 1 and report summary.
- 3 Amount is higher than actual application cost since it includes preparation of a stormwater management plan.
- 4 Joint application submitted by Louisville & Jefferson County Metropolitan Sewer District, the administering agency for the City of Louisville and Jefferson County (application cost information shown only in Tables 1 and 2).

\* Respondents generally assigned populations using available data (1980 or 1990 census) and in several cases figures are estimates of population served by the separate systems, not the actual city or county population.

\*\* Amounts are total application cost estimates where the respondent did not provide separate Part 1 and Part 2 estimates or the respondent provided a total application cost estimate that is higher than the sum of Parts 1 and 2.

1 Amounts are included in Total Part 1 Costs but are excluded in Total Application Costs.

2 Amounts are included in Application Cost estimates in Table 1 and report summary.

3 Amount is higher than actual application cost since it includes preparation of a stormwater management plan.

NAFSMA SURVEY RESULTS:  
(shown alphabetically by state)

PART 1 FUNDING SOURCES -- All Respondents	
AK Municipality of Anchorage	general fund special tax, levy or fee -- storm drainage enterprise fund with monthly utility bill
AL City of Huntsville	general fund special tax, levy or fee -- wastewater user rates
AL Jefferson County	general fund other -- State Revolving Fund (repaid by fees by newly-created stormwater utility)
AR City of Little Rock	general fund -- special appropriation during 1991
AZ City of Mesa	general fund special tax, levy or fee -- storm drainage utility fee; and support (1/3) from Denver Urban Drainage
AZ City of Phoenix	general fund -- general obligation bonds
AZ City of Tempe	general fund general fund -- capital improvements fund (generated from 1/2 cent sales tax)
AZ City of Tucson	general fund -- drainage bond funds
AZ Pima County	special tax, levy or fee special tax, levy or fee -- sanitary and storm sewer utility fee, and 1/3 from Denver Urban Drainage
CA City of Bakersfield	general fund general fund -- and support (1/3) from Denver Urban Drainage
CA City of Fresno	other -- State Revolving Fund (loan to be repaid through drainage fees on new developments)
CA City of Modesto	general fund special tax, levy or fee -- water and sewer enterprise fund
CA City of Oxnard	general fund
CA City of Stockton	general fund
CA Contra Costa County	general fund
CO City of Aurora	general fund
CO City of Colorado Springs	general fund
CO City of Denver	general fund
CO City of Lakewood	general fund
DC Washington, DC	general fund
DE New Castle County	general fund
FL Broward County	general fund -- property tax

PART 1 FUNDING SOURCES -- All Respondents

FL	City of Ft. Lauderdale	other -- currently funds are being borrowed from the water and wastewater enterprise fund	GA	DeKalb County	combination -- 1/2 general fund; 1/2 water and sewer revenues
FL	City of Jacksonville	special tax, levy or fee -- local option gas tax	GA	Richmond County	special tax, levy or fee -- 1% special purpose sales tax for drainage & roads
FL	City of St. Petersburg	special tax, levy or fee -- stormwater management utility	HI	City of Honolulu	special tax, levy or fee -- Highway Fund
FL	Escambia County	dedicated tax source -- drainage fee & in kind services	IA	City of Cedar Rapids	special tax, levy or fee
FL	Hillsborough County	special tax, levy or fee	IL	City of Rockford	dedicated tax source -- use of income tax rebated to city from the state
FL	Polk County	general fund	IN	City of Indianapolis	other -- Cumulative Fund (Capital Improvement Fund) general fund
FL	Sarasota County	special tax, levy or fee -- environmental utility fees (stormwater assessment)	KS	City of Topeka	special tax, levy or fee
GA	City of Atlanta	general fund	KS	City of Wichita	special tax, levy or fee
GA	City of Macon	general fund -- city engineer's capital budget	KY	City of Lexington	general fund
GA	City of Savannah	general fund	KY	City of Louisville & Jefferson County	special tax, levy or fee -- stormwater drainage fee & permit fees
GA	Clayton County	general fund	LA	City of New Orleans	general fund

PART 1 FUNDING SOURCES -- All Respondents

LA Jefferson Parrish	general fund	MO City of Kansas City	general fund
MA City of Boston	other -- general obligation bonds	MO City of Springfield	general fund
MA City of Worcester	special tax, levy or fee -- sewer use fee	MS City of Jackson	general fund
MD Anne Arundel County	general fund	NC City of Charlotte	general fund
MD City of Baltimore	general fund -- wastewater revenue fund	NC City of Durham	other -- borrowed from capital projects fund to be repaid from stormwater utility revenue
MD Montgomery County	general fund	NC City of Greensboro	combination -- general fund (\$175,000) special fee on water bills (\$87,000)
MD Prince George's County	dedicated tax source -- stormwater enterprise fund	NC City of Winston-Salem	general fund
MI City of Ann Arbor	special tax, levy or fee -- stormwater utility fees	NE City of Lincoln	general fund
MI City of Flint	special tax, levy or fee -- sewer fund	NE City of Omaha	general fund
MI City of Grand Rapids	general fund -- loan from General Fund to be repaid upon establishment of Stormwater Utility	NM City of Albuquerque	general fund
MN City of Minneapolis	dedicated tax source -- sewer and water bills	NY City of New York	general fund

PART 1 FUNDING SOURCES -- All Respondents

OH City of Cincinnati	special tax, levy or fee - stormwater management funds (collection of user fees)	TX City of Corpus Christi	other -- water revenues (revenue fund)
OH City of Columbus	special tax, levy or fee - fee based on monthly charge and sanitary sewer use	TX City of Dallas	funded through water & wastewater revenues to be reimbursed by storm water fee instituted 10-1-91 general fund
OH City of Toledo	general fund - appropriation from income tax revenue	TX City of El Paso	
OK City of Oklahoma City	general fund	TX City of Houston	other -- public Improvement Bond Funds
OK City of Tulsa	special tax, levy or fee - approx. one-half from stormwater utility fee	TX City of Lubbock	other -- loans from other city funds and \$150,000 from prior storm sewer improvement bonds general fund
OR City of Eugene	special fee - sewer use fee and capital funds	TX City of Pasadena	
SC Greenville County	general fund	UT City of Salt Lake	special tax, levy or fee
TN City of Knoxville	general fund	UT Salt Lake County	dedicated tax source -- flood control mill levy
TN City of Memphis	general fund	VA Arlington County	general fund
TX City of Amarillo	special tax, levy or fee - wastewater fee	VA Chesterfield County	general fund
TX City of Beaumont	general fund	VA City of Alexandria	general fund

PART 1 FUNDING SOURCES -- All Respondents

VA City of Chesapeake	general fund
VA City of Hampton	general fund
VA City of Newport News	general fund
VA City of Richmond	special tax, levy or fee
VA City of Virginia Beach	general fund
WA City of Seattle	special tax, levy or fee - drainage fee based on parcel size and % impervious surface
WA King County	special tax, levy or fee - Surface Water Management Utility Fee
WA Pierce County	special tax, levy or fee - Surface Water Management Service Charge
WA Snohomish County	special tax, levy or fee - drainage utility fee and state loan
WA Spokane County	other -- user rates and state grant (50/50)
WI City of Madison	general fund

## NAFSMA SURVEY QUESTIONNAIRE

### MUNICIPAL SEPARATE STORMWATER SYSTEM PERMITTING COSTS

Survey Completed By: \_\_\_\_\_

Agency: \_\_\_\_\_

Address: \_\_\_\_\_

Phone: ( ) \_\_\_\_\_ Agency's Population: \_\_\_\_\_

1. Please indicate the status of your city or county jurisdiction's application for an NPDES permit for your Municipal Separate Storm Sewer System (MS4).

\_\_\_\_\_ Part 1 was filed on \_\_\_\_\_ / \_\_\_\_\_ / \_\_\_\_\_

\_\_\_\_\_ Part 1 to be filed on \_\_\_\_\_ / \_\_\_\_\_ / \_\_\_\_\_

2. If available, please provide an estimate of \*costs for preparing and filing Part 1 of your application for a MS4 point.

\$\_\_\_\_\_ Costs for Part I

If you provided an estimate above, please indicate how funds were generated.

- \_\_\_\_\_ General fund  
\_\_\_\_\_ Special tax, levy or fee  
\_\_\_\_\_ Dedicated tax source (e.g. property)

Specify: \_\_\_\_\_

3. Did your city/county/jurisdiction join with another city/county/jurisdiction in your region in submitting your Part 1 application?

\_\_\_\_\_ Yes \_\_\_\_\_ No

If yes, please indicate number of co-applicants \_\_\_\_\_ and list larger jurisdictions:

\_\_\_\_\_

4. Have you estimated the cost of preparing and filing Part 2 application?

\_\_\_\_\_ Yes \_\_\_\_\_ No

If yes, please provide estimate of costs for Part 2: \$\_\_\_\_\_

\*In estimating costs, please include the following: 1) direct costs (i.e. consultants, monitoring/sampling equipment, specialized services, studies, other equipment and outside lab costs); and 2) indirect costs (i.e. in-house staff time, overhead, in-house laboratory costs and staff time, and staff time from regional agencies).

- please continue on back of page -

## 5. When do you expect to file Part 2?

\_\_\_\_ / \_\_\_\_ / \_\_\_\_ (Date)

## 6. If you have not separated your budget for Part 1 and Part 2 of your application, please provide your estimate of total costs to prepare and submit your full MS4 permit application (Part 1 and Part 2).

\$ \_\_\_\_\_

## 7. Have you estimated likely cost of compliance for your MS4 permit program?

\_\_\_\_\_ Yes          \_\_\_\_\_ No

If yes, please provide estimate and discuss briefly: \_\_\_\_\_

\_\_\_\_\_  
 \_\_\_\_\_

## 8. How do you expect to pay for implementation cost of your MS4 program?

- \_\_\_\_\_ do not know at this time  
 \_\_\_\_\_ existing revenues (general fund; utility revenues)  
 \_\_\_\_\_ new revenues (tax increase/rate increase/other)

If you have adopted or plan to adopt a tax increase/rate increase, please describe:

\_\_\_\_\_  
 \_\_\_\_\_

## 9. Since NAFSMA expects to undertake followup cost surveys, please provide a contact person below to direct future surveys:

\_\_\_\_\_  
 \_\_\_\_\_

## ABOUT NAFSMA AND ITS MEMBERS

The National Association of Flood and Stormwater Management Agencies (NAFSMA), a national organization established in 1978, represents state and local agencies nationwide and is committed to improving national stormwater management guidelines and activities and ensuring the continuation of water resource projects and other programs of interest to stormwater management and flood control agencies.

### Who Are NAFSMA's Members?

NAFSMA's membership includes representatives of state, regional and municipal stormwater management and flood control agencies from various parts of the country. Membership is open to qualified states, counties, metropolitan, special district or municipal water resource agencies responsible for water resources and/or stormwater management programs.

### NAFSMA'S STAFF

NAFSMA's staff advocates the interests of association members and facilitates communication between members and federal officials.

Call the National Office (202-682-3761) for more information:

# REAUTHORIZATION OF THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, APRIL 21, 1993

HOUSE OF REPRESENTATIVES, SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,

*Washington, DC.*

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2167, Rayburn House Office Building, Hon. Douglas Applegate (chairman of the subcommittee) presiding.

Mr. APPLGATE. Good morning to everybody here.

This morning the Subcommittee on Water Resources and Environment is going to continue its hearings on the Clean Water Act. Today we are going to hear from a very distinguished group of Members of this august body.

Perhaps there hasn't in this session, nor for many sessions, been such a very distinguished group of Members from the House that will be gathered in one room.

Tomorrow we will continue to receive testimony from an environmental panel and an agricultural panel. And we are going to proceed very quickly here.

But first I want to yield to the Ranking Minority Member, Congressman Sherwood L. Boehlert of New York.

Mr. BOEHLERT. Mr. Chairman, I have an eloquent statement that I would like to insert in the record at this point and get on with the proceedings, since I am the one that delayed its start.

Mr. APPLGATE. Thank you, Mr. Boehlert.

We have two Members with us right now, and I am going to ask them why not come on up to the table, Benjamin Cardin and my good friend Don Edwards. And we will just take—I am not going to hold to a particular order.

I don't have to introduce Mr. Edwards to anybody. He is the Chairman of Judiciary Subcommittee on Civil and Constitutional Rights. And if anybody wants to know anything about the Constitution, they need only to get in touch with Don Edwards because he is the expert and does a tremendous job. He has also been very interested in wetlands reform and he has legislation before the Congress.

At this time, we will hear from our friend and colleague, Don Edwards.

## TESTIMONY OF HON. DON EDWARDS, A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA

Mr. EDWARDS. Thank you very much, Mr. Chairman.

I am honored to be here before the members of this committee and especially the Chairman of the Public Works Committee, my good friend and colleague, Norman Mineta.

Mr. Chairman, I am pleased and congratulate you for taking action on reauthorizing the Clean Water Act. You have under your consideration the opportunity to make some changes to the Clean Water Act, particularly to legislate reforms of the laws governing our Nation's wetlands.

You know that our wetlands are in a crisis stage in this country. We have already lost 50 percent of our wetlands, and at the present rate of loss of about 300,000 acres per year, you can see the risk we face regarding this important natural resource. I know that I certainly don't have to explain to Members of this distinguished subcommittee the importance of wetlands in this country.

Wetlands play a vital role in the environment, sustaining habitat for fish and wildlife, and providing flood control and many other important functions. What we need are specific provisions in the Clean Water Act on wetlands, provisions that protect farmers, that protect private landowners, and provisions that take charge of the issue in a way that they do not now.

There are too many nonspecific regulations on wetlands and often people don't really know how best to comply with the law.

The bill that you have referred to and that I have introduced in this Congress is H.R. 350. This bill attempts to put some sense into the wetlands regulations regulations of the Clean Water Act in a moderate, intelligent manner. In the first place, H.R. 350 takes care of farmers so that they don't have to worry about maintaining normal, ongoing farming practices on wetlands.

It takes care of private landowners by calling for a fast-track to provide consideration within 60 days of permits affecting wetlands of one acre or less. Everybody certainly is entitled to that.

H.R. 350 expands wetlands regulations to cover some procedures that are not now covered by current law that do great damage to wetlands, such ditching, draining and the indiscriminate removal of vegetation. But I think it does this in a way that would satisfy people.

It has already 67 cosponsors, Republicans and Democrats, and Mr. Chairman, just about every major environmental group, in the country strongly supports H.R. 350.

I have distributed a detailed description of the bill and so I won't describe it very much more, unless there is a question or two. It is time to face up to the crisis that we face in this country, and to include in the Clean Water Act appropriate provisions regarding our Nation's terribly, terribly valuable resource, our wetlands.

I commend you for examining it, and I thank you very much for allowing me to be here today.

Mr. APPLEGATE. Thank you very much, Don.

I was going to go right to Ben, but I think what we will do to expedite each individual Member is to see if there are any other questions that they would like to address.

But I would only say for myself that I have the greatest admiration and respect for you, your expertise and what it is that you are trying to do. And certainly you articulate your position exceedingly

well, and I feel blessed to have your testimony before the committee.

I thank you for being here.

I have no particular questions right now. I think your statement pretty much says just about everything that needs to be said.

Mr. EDWARDS. Thank you, Mr. Chairman.

I do have another committee meeting; I would like to be excused, as much as I would like to hear Mr. Cardin's testimony. Especially since he is talking about the beautiful Chesapeake Bay. I commend his testimony to you.

Mr. APPLGATE. Don, would you yield to perhaps any questions?

Mr. EDWARDS. Of course, yes.

Mr. APPLGATE. Mr. Boehlert.

Mr. Mineta?

Mr. Hayes?

Anybody down the line have any questions for Mr. Edwards?

Well, I guess you do a complete statement, Don, pretty good.

Thank you.

Mr. EDWARDS. Thank you.

Our next witness, we are fortunate to have Ben Cardin from the great State of Maryland and a former Member of our committee. He is now moving on into the ranks of the powerful in the Ways and Means Committee. And he is very interested, of course, in the Chesapeake Bay, which I think most everybody is; particularly on the East Coast, and I think a very important issue to be addressed.

#### **TESTIMONY OF HON. BENJAMIN L. CARDIN, A REPRESENTATIVE IN CONGRESS FROM MARYLAND**

Mr. CARDIN. Mr. Chairman, I thank you for that welcome. It is always a pleasure to return to the committee that I served on in Congress. The Subcommittee on Water Resources has played such a critical role in helping to develop our waterways and clean the waters of our Nation.

I want to congratulate you and Mr. Boehlert on the past work of this committee, and wish you the best in the task that you have ahead of you. I know that the committee is under excellent leadership as it tackles the very difficult problems involved in reauthorizing the Clean Water Act. And it is always a pleasure to be with the Chairman of the committee, Mr. Mineta; He too is to be congratulated for the work that he has done to improve all transportation in this country.

I had the opportunity to serve with both of you on this committee and enjoyed those years. And I regret that I no longer have the opportunity of serving directly with you on this committee.

I would ask, if I might, that my entire statement be placed in the record and I will try to summarize a few of its points.

Mr. APPLGATE. Without objection.

Mr. CARDIN. I appreciate the comments of Mr. Edwards. I think all of us in the Mid-Atlantic region and many across the Nation appreciate the struggle that has been fought to reclaim the Chesapeake Bay. We can be proud of the role that the Federal Government has played in bringing back some of the water quality that we enjoyed as young people on the Chesapeake Bay.

It has really been a success story about good government. It began over 10 years ago, with the signing of the Chesapeake Bay Agreement by the EPA Administrator and the Governors of the three States, Maryland, Virginia, Pennsylvania, and the Mayor of the District of Columbia. Also signing the original compact was the Tri-State Chesapeake Bay Commission Chairman.

The Bay Program has grown as an international model for regional intergovernmental cooperation and long-term environmental restoration and protection.

Later today I, along with many of my colleagues from this region, will be introducing the Chesapeake Bay Restoration Act of 1993. Rarely has a piece of legislation been so broadly and deeply supported.

This bill is supported by every imaginable group interested in the Bay. Each of the regional States and the District of Columbia, industry groups and a wide array of environmental and citizens groups have joined in support of this legislation.

There is perhaps no other issue that so unites the people of the mid-Atlantic States as the cleanup of the Chesapeake Bay. It is our hope that this subcommittee will include language to continue and improve the Chesapeake Bay Program in the new Clean Water Act, as you have done with the prior authorizations of the Clean Water Act.

This year's bill seeks to better coordinate the many Federal activities and responsibilities related to the Bay. Organizing various Federal agencies' efforts in the cleanup has become increasingly important.

Nine Federal agencies now have formal memorandums of understanding with the EPA's Bay office and others manage large tracts of land or major facilities within the watershed.

In addition, a number of ongoing Federal activities relate to the Bay cleanup would be directly unified under this authorization.

One of the offshoot programs begun in recent years that we are now trying to bring under the Bay Program "umbrella" is the toxics reduction strategy. A second is an ongoing effort in the Bay Program of demonstration habitat restoration and enhancement projects.

The EPA continues as the lead Bay Program agency under our proposal while a Chesapeake Bay Federal Agencies Committee is established with representatives from 16 Federal agencies. Federal facilities and activities within the Bay watershed are required to be consistent with the goals of the Bay Program.

And given the fact that we are now celebrating the 10th anniversary of the program, the bill also directs EPA to undertake a comprehensive assessment of the entire Chesapeake Bay Restoration effort.

The Federal role in the Chesapeake Bay Program has been the glue holding the Federal, State and local activities together in the long-term battle to reverse the Bay's decline. There are signs of improvements and many victories.

Phosphorus discharges in the Bay, a key component in the nutrient loading problem, have declined by 35 percent from 1985 levels, in large part due to the ban on phosphorus in detergents and the construction of new sewage treatment facilities. Submerged aquatic

vegetation, critical habitat for many Bay species, has been making a slow but steady comeback due to the overall improvements in water quality. And now, the striped bass population in the Bay is up from dangerously low levels in the early 1980s, based upon a successful management control program.

But the toughest challenges lay ahead and threats to this Nation's most productive estuary remain very real. Nutrient loads of nitrogen have increased 5 percent since 1985. Many key species, including oysters, shad, and white perch, continue to decline.

Toxic concentrations in the Bay are increasing and, more importantly, the population in Bay's watershed is increasing. The region's population grew 40 percent in the last 20 years, and whether by runoff from newly planted lawns or air pollution from automobiles, the pace threatened the overall restoration effort.

Though many challenges remain, the EPA Chesapeake Bay Program is a great success and a model for similar regional efforts. As you shape the clean water reauthorization, I would ask that you continue and strengthen our worthy efforts to "Save the Bay".

Mr. Chairman, I would also like to point out the strong work in developing this legislation and implementing it by one of the Members of your committee, Mr. Gilchrest of Maryland. His district, more than any other, borders the Bay and he has been a key leader in developing community support and bringing together the coalition that has been successful in the Bay's restoration to date.

I appreciate your time and I would be more than pleased to answer any questions that you might have.

Mr. APPELATE. Thank you.

Thank you very much, Ben. I appreciate your testimony, but I think I have no questions.

In reviewing your statement, I think you have covered that very well. And we certainly will be working with you to try to help you to achieve the goal that you are trying to do.

Mr. CARDIN. Thank you.

Mr. APPELATE. Mr. Gilchrest.

Mr. GILCHREST. Thank you, Mr. Chairman.

I would like to make a quick comment.

Ben, I appreciate you coming here testifying on behalf of our State and the Bay. And I particularly liked the idea or the term you used, the glue which holds this program together. And, in fact, the Federal Government's role is as being the glue that holds, not only the different States together, but the municipalities and all of the different regions.

If we are going to protect the Bay, it has to be from a watershed management perspective. And looking at that, we have to understand the Federal Government's role in managing, at least helping those municipalities and the States to manage the growth.

Ben, you mentioned the increase in nitrogen in the Chesapeake Bay and a large part of the cause of nitrogen comes from cars, air pollution, and increased pressure from population growth. And the whole host of things, managed growth, protecting wetlands, point and nonpoint sources, the grasses of the Bay is where it all starts.

This is a piece of a comprehensive program where no agency or Federal or State Governments can excuse themselves. It is a com-

plicated process, and we all have to be a part of this glue that hold itself together.

Ben, I look forward to working with you.

Mr. CARDIN. Thank you.

Mr. APPLGATE. Very well said.

Our distinguished Chair, Mr. Mineta.

The CHAIR. Nothing, other than to thank our colleague for his leadership on this.

Let me thank you for testifying.

Mr. APPLGATE. Mr. Boehlert.

No questions?

Mr. Hayes.

Mr. HAYES. Actually, not so much a question as an observation.

The support, I think, is universal for the Chesapeake Bay area. And in looking at your bill, there are two things that I wanted to ask you in just a moment.

What is the makeup of the council? There is a reference and I have seen references before to the Chesapeake Bay Executive Council. How is that comprised?

Mr. CARDIN. The bill provides for a new coordinating council.

Mr. HAYES. The Federal council.

Mr. CARDIN. The Chesapeake Bay Executive Committee is the final coordinating authority. Currently, it is made up of the Governors of the States that are involved, the Mayor of the District of Columbia, Tri-State Chesapeake Bay Commission.

Mr. HAYES. I see.

And the second thing I simply wanted to point out and elicit your support equally. I noticed that the funding levels, which I am sure in this time of budget constraints, is modest to the need, was \$23 million in 1994 and \$28 million in 1999, progressively. I don't quarrel with those numbers. I suggest that they are much lower.

But I would elicit your support at the same time in looking at the Gulf of Mexico, which in the last presidential budget was \$4.5 million for all activities that would deal with our wetlands and the protection from erosion, and takes in the tip of Texas all the way to the tip of the State of Florida. And simply suggest that we work together in our regions, recognizing that while you are probably underfunded at this level, I absolutely guarantee you that the area that produces about a quarter of the revenue to the United States that is not non-tax collected, clearly cannot sustain itself on levels of \$4.5 million dollars. I appreciate your work on the bill.

Mr. CARDIN. I appreciate those comments.

We are talking about a very small amount of Federal funds leveraging all the other resources that are put into the restoration efforts. We would hope that intergovernmental models, such as the Chesapeake Bay Program, would be used for other water bodies around the Nation. And I can tell you that many of my constituents that spend their summers here in Maryland, spend their winters along the Gulf of Mexico. So I assure you that we have a common interest to make sure that water is clean, too.

Mr. APPLGATE. Thank you, Mr. Hayes.

Mr. Deal?

Mrs. Byrne?

Mrs. BYRNE. Mr. Chairman, thank you.

Ben, I worked on the Chesapeake Bay Committee for the Commonwealth of Virginia in the State Assembly, and one of the things you put your finger on in your testimony, I think, needs some further explanation and exploration, is that the nonpoint pollution—we have made a valiant effort in looking at point pollution as it affects the Bay.

What we are finding is that when it comes down to the issue of land use, and dealing with nonpoint pollution, that the Bay Compact and the whole mechanism starts to unravel. And I was wondering, does anything that you have got in your proposal here really address the land use issue?

Mr. CARDIN. Leslie, I appreciate that question.

The Federal Government's role here is really a coordinating role and to facilitate the activities at the various levels of government. Most of the States have taken action to deal with nonpoint pollution issues.

As I indicated in my original comments and Mr. Gilchrest indicated, a good deal of the problem is non-point sources of pollution—the use of automobiles and acid rain issues, as well as the runoff that naturally occurs from the number of people living in the region. In my State of Maryland, we have passed rather progressive land use management programs, including 20-acre zoning around critical areas, changes in farming practices and fertilization of home lawns. I am aware of similar efforts in the State of Virginia and the Commonwealth of Pennsylvania.

Certainly many of the problems associated with the Bay are caused in the tributaries that lead up and supply the water to the Bay. You are absolutely correct. The role, though, that we have played at the national level is to facilitate local action. I would say that up to this point, I think there has been rather dramatic action taken at the local level to improve the quality of the Chesapeake Bay.

Mr. APPELEGATE. Mr. Filner.

Mr. FILNER. I see one of the advantages of coming late is that you can piggyback on the previous spokes people.

So I would like, Ben, to enlist your support and enlist Mr. Hayes' support for wetland restoration in the Tijuana River Basin in California.

Thank you for your testimony.

And Mr. Hayes, thank you for raising other issues. I need even less money than you two do.

Mr. APPELEGATE. It is good to hear.

Mr. POSHARD.

Mr. POSHARD. I have no questions.

Mr. APPELEGATE. Mr. Hamburg.

Mr. HAMBURG. No questions.

Mr. APPELEGATE. Ms. Molinari.

Ms. MOLINARI. No, thank you, Mr. Chairman.

Mr. APPELEGATE. Ben, thank you again.

We are privileged to have Mr. Barney Frank.

#### TESTIMONY OF HON. BARNEY FRANK, A REPRESENTATIVE IN CONGRESS FROM MASSACHUSETTS

Mr. FRANK. Thank you, Mr. Chairman.

Mr. APLEGATE. Needless to say, I think everybody knows Mr. Frank. He is the Chairman of the Banking Subcommittee of International Development, Finance, Trade and Monetary Policy and has been extremely active in the cleanup of the Boston Harbor, as well as very active in other environmental issues.

I would suggest that if you keep the speed of your speech down so that we could understand it, we would appreciate it.

Mr. FRANK. Sometimes being understood is important and sometimes not being understood is important.

I appreciate the chance to come here early, and I am glad your subcommittee is looking at this now so that we get a full look. I think we should have broad agreement across ideological and partisan lines as we reauthorize the Clean Water Act, and the Federal role in providing funds ought to be increased over where it has been.

I think there are generally legitimate complaints about Federal mandates that aren't always thought out. Obviously, the local governments and the people who live in the areas are the prime beneficiaries and they have to pay, but I think we have tilted too far in one direction.

Also, talking to the people in the district I represent who are under a mandate under the Clean Water Act, they have made some suggestions which appear to me not to cost the Federal Government any money but would, by increasing the flexibility, allow them to save some money overall. Because I am concerned not just with Boston Harbor, which is a major concern to the people of Massachusetts, but the cities of New Bedford and Fall River, which I represent in whole and in part, respectively. And a colleague Peter Blute from Massachusetts represents the other half of Fall River.

One of the suggestions, for instance, which was made to me, and I was hoping this was something that we might be able to move on somewhat quickly on an interim basis. The municipalities have told me that if the statute were amended so that they could issue 30-year bonds instead of 20-year bonds on some of these projects, they would save a lot of money. And, obviously, people are familiar with that.

A 20-year mortgage versus a 30-year mortgage, saves you money. Here is a situation with no financial impact on the Federal Government, it seems to be wholly responsible because these are projects that last more than 30 years.

We are not talking about bonding for 30 years a program that has a four- or five-year life. And I have been told by people in the areas that I represent, by their bond contractors and others, that simply amending the law to let them go to 30 years on the bond and allowing that to be retroactive, in some cases, would save them a lot of money. I would hope that we might even look at doing that as an interim measure pending the overall reauthorization.

The other point I would say, as I understand it, the current assumption is that the funding from the Federal Government to the various State revolving funds ends in 1998. And I gather that was the assumption under which President Reagan was persuaded to sign the last reauthorization.

The CHAIR. It is 1994. Under the present law, it is 1994.

Mr. FRANK. I agree. But the assumption at the OMB and the EPA was that it would go to 1998. That seemed to be in their budgetary assumptions.

If we were to continue, if we make a commitment to continue the funding, we would also have an enormous impact, we would be alleviating the impact on the communities. I don't understand why the Federal Government ought to get out of the business right away, and it would seem that the States would have more flexibility in terms of the reimbursement rates from the local communities.

In terms of people in much of Massachusetts, which is a State in which there has been a strong environmental strain and where there are people that care a lot about the environment, if the people in Massachusetts and greater Boston, New Bedford, Fall River and the City of Lawrence, and elsewhere, are told that there is to be no change in the financial impact of complying with the Clean Water Act, you are going to see, I think, a large number of people in Massachusetts telling us to weaken the Clean Water Act. People forced to choose between the economic survival of their communities and clean water, will choose their communities.

I don't want us to put them to that choice. I am confident that we will be able to avoid that in this bill. That seems to be the stakes.

I have walked through factories in New Bedford that are water intensive. They are faced over a fairly short period of time with a 300 percent increase in water rates at least. And when some of them leave, those that are left behind have to pay higher rates because the amortization stays the same.

So we are talking about a degree of financial hardship on people who are not particularly wealthy, in communities that have already had economic problems and they are going to say don't do that. My preference is for a set of amendments to the Clean Water Act that extend the funding and do other things that would ease the financial burden.

If I had to choose between the current level of burden that the municipalities are going to be hit with, if I had to choose between that and weakening the requirements of the law, I guess I would vote for weakening the requirements of the law.

I don't want to do that. But I don't think we can put people to that choice and there are alternatives. So I would hope that we could make the decision that we were going to explicitly continue the funding, and give the States more flexibility.

In the State of Massachusetts, for instance, I think we could get the State to increase its own share of the funding, but also ease the repayment terms substantially for many of the municipalities that are otherwise facing problems. There are problems for Massachusetts such as the restriction that only 20 percent of the State's funds can go for CSOs.

I don't understand why that was in there. I think for Massachusetts that could be a potentially very serious problem. And I want to urge that maybe we could take a look at a short-term move to go from 20 to 30 years on the bonds.

I have been told that this will have an impact on easing the financial impact, and I can't see a negative from the standpoint of

the Federal Government. I will have more specifics in this regard, but removing that CSO restriction, increasing the bonds from 20 to 30 years, and committing now to an increased level of Federal funding chronologically, not in any one year, but that we keep it going well into the next century, I think that, coupled with more flexibility for the States in repayment terms, frankly, from our standpoint, saves the law. Because it makes something that would be intolerable, tolerable for the people in our communities.

Thank you, Mr. Chairman.

Mr. APPLGATE. Thank you very much, Barney.

I would only say that it is true that if communities had to make a choice between their survival or cleaning up sewer and water, they would pick the survival of their communities and we don't want to have to pit one against the other.

The other is the 20- to 30-year payback. I think that makes sense, and it seems to be what most people who have testified before the committee feel. And I think that is going to be given the strongest of consideration.

And, of course, the third thing would be flexibility, and the States do need more flexibility.

Mr. FRANK. Mr. Chairman, I don't know what your time table is for the whole reenactment, but if we are not going to get to that until next year, I wonder on the 20 to 30 years if you could initiate an interim measure to do that. Even if that was to expire when the whole act was to expire.

It seems that we might be able to do that on suspension and it seems to be one that is a win/win for everybody.

Mr. APPLGATE. I don't have any problem with that. We will have to see what the possibility is.

Mr. FRANK. I can see since Boston Harbor is very prominent here. If to advance that goal, if the Rules Committee could be at all helpful, I am inclined to think they would be. Like that amendment would be in order and anything you wanted.

The CHAIR. I have a question on that. Part of the reasoning, as I understand it, for the 20-year bond limitation was, first of all, the design life of the plant. Secondly, it was because the way it was thought, it could recycle the State Revolving Fund monies more rapidly. You have indicated that it would be less costly to the communities if we went to a 30-year bond. I assume that what you are saying there is that the yearly cost of that is going to be less. But I would assume that the aggregate, it would be more expensive, because just as a 30-year home mortgage is more expensive than a 20-year home mortgage, just because of the additional cost, but on the annual increment it would not be as much.

I was wondering, New Bedford is how large a community?

Mr. FRANK. About 97, 98,000.

The CHAIR. Well, that is a little larger than I was anticipating, but since we have gone to this State Revolving Fund, it seems to me that there are many communities that cannot afford the cost of going through the State Revolving Fund. And I was wondering if in the case of Massachusetts or some of these other cities, whether or not we would be maybe better off going for small and rural communities, going back to some kind of a grant program rather than having it to be all through the State Revolving Fund.

Mr. FRANK. I think it is a very important option. You could even have a hardship type of a situation. Some of the people suggested to me that in addition the option could be either a direct grant or a direct loan program, that some of them might be able to do this more quickly and flexibly if they didn't have to go through the State fund.

But we have a couple of really small communities. The City of Fall River is another one that is about the same size, 90,000. It is an old city. We have old everything there and it is going to cost them a lot of money because they have to do, not just the treatment, but a CSO operation as well, which down the road costs them even more money. I think that would be useful.

In regard to your other point, which is a perfectly valid one, what I am told now is that the state of art is such that these are all more than 20-year life. That maybe that was a problem at the beginning but they are consistent that they are designing projects that have 40- and 50-year lives.

And the other reason on the 30 is this, Mr. Chairman, and that is it is true, obviously, overall it costs you more, but one of the things they are facing is the initial price shock that could drive people out of the city. And what you then have is, you know, after the 20 years, if it is all paid for, theoretically there might be an abatement in the price. But a whole lot of people wouldn't be left around to pay for it, particularly manufacturers who have any kind of water intensity. Because they will move. And we face a severe likelihood of industry moving out.

I would certainly want to work with you on an issue like that as well.

Mr. APPLGATE. Mr. Boehlert.

Mr. BOEHLERT. I want to thank my colleague for his usual eloquence. I want to ask him to answer a proposal that has been advanced before this subcommittee.

It is called the "Principal Subsidy Plan" and it argues against resurrecting a grant program and argues for continuing the State Revolving Loan Program, but gives to the States flexibility. And in recognition of those hard-pressed communities, where they can't come up with the next nickel and would perhaps subsidize some of the principal repayment. Give me your thoughts.

Mr. FRANK. It seems to me that there are variations. I agree with that. It seems that we can be complying with what most of us talk about, local autonomy and flexibility.

Let's give the State the right to waive reimbursement and structure the terms that are better for people because you will have differences within the State. I think that would be a very useful way to do it, which would be to say the State will have the flexibility to restructure those terms.

Now, again, I couple that, though, with the argument that we have to make a commitment at the Federal level that we are going to sustain contributions to the State Revolving Funds into the next century, because the ability of the State to be flexible in terms is going to be affected if they think we are cutting them off; in two or three years, it is out the window.

But within that context, I think it is a very useful way to do it.

Mr. BOEHLERT. On your 20- to 30-year period, would you be receptive to language that would suggest something along the lines, the repayment period could be constructed in such a manner as to in no instance exceed the life of the project; in other words, you might go 40 years?

Mr. FRANK. Yes, if you want to go beyond that. Whenever a Chairman or Ranking Member asks me a question that begins with "would you be receptive," the answer is probably yes.

To get into the merits, we have had some evolution here. Some of the early projects weren't well designed. We have had some problems. But by now there is a pretty good degree of confidence that we are designing projects that have that kind of life, and I would say yes, that is appropriate.

Again, while it is true that it may cost more—does cost more overall, it is shifting the cost over a different base of people. It is having less negative impact. It is a more rational way to structure it. And while it is true that a 15-year mortgage costs you less over the lifetime than a 40-year mortgage, most people still go for the longer one. But I think that would be very appropriate and moving to give them flexibility.

Mr. APPLGATE. Thank you, Mr. Boehlert.

Mr. Hayes.

Mr. HAYES. Would you be receptive—

Mr. FRANK. Where are you on the committee? You are below the staff desk.

Mr. HAYES. I think that is true in the case of most committees. The question that I have regards banking in the Banking Committee, because what happens too often is that we don't appear before your subcommittee, we don't appear before ours, when policy is made. You made an excellent case for reducing options regarding financing and bonding implications. And I would suggest and ask, that at the appropriate time in your Banking Committee, that there are other policy considerations that affect institutional loans as well.

We have gotten into earlier testimony from municipalities and counties who come into not only financial problems but time delays on environmental permitting and we come into problems with private land for water for sewage and compliance with clean air. And we come again and again to individual property owner rights, where the answer is unless the use of the property is completely denied, that it hasn't had an impact.

Suppose you have a financial institution in Boston holding the mortgage and we make changes here thinking solely in terms of a delineation manual. And because right now that bank holding the mortgage in Boston doesn't know whether the property mortgage will or will not be so classified. I suggest that we ought to all be receptive to the realization that we could bust some financial institutions, especially in areas like mine and parts of Massachusetts, if we change the rules about what they are holding as collateral.

I think the interchange of the committee work ought to be far more frequent and accessible. And would ask that, if you could do so, to have the Banking Committee look into the impact of what we are doing in water quality on financial institution collateral holdings.

Mr. FRANK. I think that is exactly right, because while this is a new aspect of it for me, that you suggested to me, I have been working on it in connection with the Superfund liability with the lender liability, and it is a similar situation. And I believe that the current state of the law, it interferes with our ability to get housing built. I have been talking to Al Swift in Energy and Commerce, maybe the Chairmen of the various committees could set up an informal entity to work.

You are familiar with the lender liability issue and it is similar in terms of people who are lending in good faith finding that they are very adversely affected.

Mr. HAYES. Nor do I think it necessary to give us any environmental quality. It is not true that therefore there is environmental damage.

What we are saying is if the public purpose outweighs the interest of the private individual or financial institution, then government has a responsibility to react to it rather than to simply say you lose. To not say that we don't have unenvironmental or environmental projects without quality, but that we recognize that when we make the one decision on behalf of the public, we have an obligation on behalf of private owners and governmental entities trying to do similar public person construction.

Mr. FRANK. I agree. I think the greater danger to the achievement of stronger environmental standards is if the Federal Government and other agencies of the Federal Government are too unwilling to put up some money. I think you are more likely to have people turning unfavorable to environment concerns if they are left with bad financial considerations.

I think that in fairness in the financing, if the public is the beneficiary, the public ought to pay some of the price.

Mr. APPELATE. Mr. Gilchrest.

Mr. GILCHREST. Thank you, Mr. Chairman.

Mr. Hayes, just a comment on your questioning of Mr. Frank.

I think all of us, and I think you make a good point when you say we need to look at all of the potential hardships that are placed on the community with overburdened Federal regulation. And when we move into the Clean Water Act, I think we have to keep our minds open, eyes open and options open to create laws that are reasonable, logical, and can be accepted by local community who usually bear the burdens of the difficult financial situation.

Mr. HAYES. Would the gentlemen yield?

Mr. GILCHREST. Yes.

Mr. HAYES. And with regional flexibility. So while much of your area looks like South Louisiana, Barney has a different problem with Boston and the outlying areas, as I do in New Orleans and the southwest Louisiana area. I think the idea of regional compacts across the Nation with a treatment consequential to their topography and geology makes equal sense.

Mr. GILCHREST. I think it does, too.

Mr. Frank, people have used the word "flexibility" and you have used the word "evolution," and I think we are all becoming more sophisticated in some of these issues to understand that flexibility is a key to the success.

I want to throw out an idea to you and have you, I suppose, respond to it. I agree with you on the State Revolving Loan Funds should continue to be funded by the Federal Government, at least through the year 2000, and maybe beyond, considering all the ramifications that has in a positive way on States.

We have reached a point where we need to look at improvements and alternatives to the conventional way that we create these waste water treatment plants. Normally, in the past we set one up and the life was about 20 years and the whole thing had to be redone.

If you set one up for 30 years, then they are going to have to be redone in 30 years at probably the same cost that it was built at in the first place. So alternative ways of treating human waste, I think, is an idea whose time has come and we need to pursue looking into that in a scientific fashion.

Mr. FRANK. I, obviously, agree with that. Here, I must say, is an area where I think many of us in the House would be deferring to the expertise of yourself and the people you work with when you get into the areas of what are the forms of treatment. I anticipate that it is less likely that I am going to know anything about that than the financial implications.

But there will be people in the House rooting for you. But if there are or could be more efficient ways to do it, everybody would be in favor of that.

Mr. GILCREST. Thank you.

Mr. APPLGATE. Thank you, Mr. Gilcrest.

Mr. Filner.

Either of you gentlemen have anything?

Nothing?

Ms. Shepherd.

Okay. I guess you handled it pretty well.

Mr. FRANK. Thank you, Mr. Chairman. I am encouraged. I think we can improve what people are facing substantially without any serious problems to ourselves.

Mr. APPLGATE. Thank you very much, Barney.

Okay. I think we have four Members. I am going to ask them all to come up right now.

As I say, possession is nine points, so once you get the table, that is it.

Mr. Lipinski.

Mr. Visclosky.

Mr. Ackerman.

Mr. Shays.

You are chairing a committee right now, Bill?

Mr. LIPINSKI. Yes, I am.

Mr. APPLGATE. And you had asked that you be allowed to get on early and as a Member of the committee, a former Member or Member now.

I think what we will do is allow you to give us your thinking that we need today.

I can only say that Mr. Lipinski has been very interested in the situation that has happened in Chicago and the systems that they have there. And the system that prevented apparently a billion gal-

lons of raw sewage from getting into Lake Michigan, but a system that needs to be updated.

We will allow you to proceed.

**TESTIMONY OF HON. WILLIAM LIPINSKI, A REPRESENTATIVE  
IN CONGRESS FROM ILLINOIS**

Mr. LIPINSKI. Thank you very much, Mr. Chairman.

And, yes, I still am a Member of the Public Works and Transportation Committee, even though I am not a Member of the Water Resources Committee. I would have liked to have been but, unfortunately, it was all filled up by the time I got around to making my third selection.

Good morning, Mr. Chairman and Members of the subcommittee.

Thank you for this opportunity to present my views on behalf of the Metropolitan Water Reclamation District of Greater Chicago. I would like to express my appreciation for the many years of support this subcommittee has shown for water pollution control programs in Cook County, Illinois.

I would like to provide you with a progress report on the district's landmark plan to provide flood pollution control benefits to the people of Cook County, the Great Lakes States and our Canadian neighbors. This is also the opportunity for me to make a request of the continued Federal involvement in addressing the combined sewer overflow problems faced by my constituents.

Over two decades ago in an effort to meet the water quality goals of the Clean Water Act to prevent back flows into Lake Michigan and to provide an outlet for flood waters, the district designed the innovative two-phase tunnel and reservoir plan also known as TARP. Phase one is a combined sewer overflow elimination system, while phase two will provide containment reservoirs.

Both elements of TARP will bring flood control relief to hundreds of thousands of residents and businesses in the Chicago lands area. TARP phase one is an intricate system of drop shafts, tunnels and pumping stations. These are designed to capture combined sewer overflow from a service area of 375 square miles, containing 13,500 miles of sewers.

Of the 110 miles of tunnels comprising TARP Phase One, the largest is the main tunnel—excuse me, the mainstream tunnel. To give you some idea of TARP's capacity, the completed portion of the mainstream consists of 31 miles of tunnels, 13 to 33 feet in diameter and 240 to 300 feet below ground. The mainstream portion of TARP was funded through the Construction Grant Program and placed in operation in 1985.

I am pleased to point out that mainstream was completed on schedule and under budget. Frankly, this accomplishment is extraordinary considering TARP's scale and the engineering complexity involved. On October 18, 1985, the first operational filling of the tunnel occurred. This happened when a 12-hour duration rainfall generated 3 inches of rain in the Chicago metropolitan area.

A rainfall of this magnitude normally causes health-threatening water pollution and back flows of raw sewage into Lake Michigan. However, as a direct result of TARP, over 1 billion gallons of combined raw sewage was prevented from being discharged into the

Cook County waterways. Additionally, flooding into the areas adjacent to the mainstream tunnel was virtually nonexistent.

I would suggest that this proven effectiveness of TARP serves as a model of how Federal dollars can be well spent.

Mr. Chairman, in the first a years of operation, TARP has eliminated 75 percent of the combined sewage pollution problems throughout most of the Chicago land area and its 15 nearby suburbs. However, the program faces uncertainty today. As you know, funding authority for the construction grant program has elapsed and the State Revolving Fund Program is underfinanced.

If this situation is not corrected soon, TARP's construction will not continue on schedule. While the district has 85 miles of tunnel completed, or under correction, it still has about 25 miles to complete, along with a pumping station and some additional elements.

If the construction grant program is not reauthorized, I would suggest to you that we jeopardize losing the very benefits district engineers have worked so hard to achieve.

Throughout TARP's development the district has worked closely with the State of Illinois and local authorities. However, the financial scope of this program has always been beyond the capacity of local resources. Fortunately for the people of Cook County, Congress has remained committed to making up the difference. This continued Federal involvement is necessary if tap TARP is to be complete. Obviously, the job is not yet finished.

EPA has consistently found TARP to be the most cost-effective solution for reducing storm impact on Chicago and the surrounding metropolitan area. What is important to the district and to the citizens of Cook County is to protect the investment already made through the construction grant program.

Mr. Chairman, TARP stands as a tribute to our Nation's clean water goals. In an effort to protect this investment, I am requesting that the subcommittee continue Federal involvement throughout the construction grant program. The program should be authorized at or near its pre-1986 level of \$2.4 billion. Of this amount, the district will request \$500 million to complete Phase One.

Again, I appreciate this opportunity to testify here today. I am confident that with adequate funding of projects like TARP, we can achieve the goals of the Clean Water Act.

I make this request on behalf of the district, the entire Great Lakes Region and the people of Cook County Illinois.

I thank you for this opportunity to testify, Mr. Chairman, before your subcommittee. I want to say in closing that this TARP program in the Chicago land area is really something to see. And if you or any Members of your subcommittee would be interested in taking a tour of this, the Water Reclamation District of Greater Chicago would certainly like to facilitate that.

Mr. APPLGATE. Thank you very much, Bill. Very good statement.

We certainly can understand the problems that you are having in Chicago, but they have done well with what they have. But apparently there needs to be an updated project to take care of the inefficiencies that do exist.

Does anybody else on the committee have any—Mr. Poshard?

Mr. POSHARD. Mr. Chairman, only to lend a word of encouragement to the gentlemen from the north end of my State. Bill has talked to me on many occasions about TARP and the efforts that they are putting forward there to resolve a complex problem for a city the size of Chicago.

I would like to advocate for Bill, and lend my support for your cause. Thank you for appearing before the committee.

Mr. LIPINSKI. Thank you very much for that.

Mr. APPLGATE. Thank you, Mr. Poshard.

I would remind the people that the Lipinski is a Chairman of the Subcommittee on Merchant Marine and does a tremendous job chairing that committee.

All of your statements will be made a part of the record.

**TESTIMONY OF HON. GARY ACKERMAN, A REPRESENTATIVE IN CONGRESS FROM NEW YORK, AND HON. CHRISTOPHER SHAYS, A REPRESENTATIVE IN CONGRESS FROM CONNECTICUT**

Mr. APPLGATE. Next we are going to go to the first ones in and we are going to go with Gary Ackerman, who is also very interested in Long Island, improvement of water quality on Long Island Sound. He Chairs the Subcommittee on Asian and Pacific Affairs and has been appointed to the Merchant Marine Committee.

It is good to have you.

Mr. ACKERMAN. Thank you very much, Mr. Chairman. And I am glad that Chairman Lipinski saw me here. I don't need an absent note as to I why I am not before his committee right now.

I am here today with our colleague, Congressman Shays and he is the Chairman of the Long Island Sound Caucus and has done tremendous work in this area.

With your permission, we have a full joint prepared statement that we would like to submit for the record. And if I may, I will summarize and Mr. Shays will have some comments.

Mr. APPLGATE. Proceed, and it will be included in the record.

Mr. ACKERMAN. If you have any questions, we are receptive, very, very receptive, as receptive as you need us to be, we are receptive.

Thank you very much.

We appreciate the opportunity to come before the subcommittee and to express our desire to see action on one of the Nation's most important waterways and to encourage the inclusion of the Long Island Sound Restoration Act in the bill. And also to express our hope that last night's victory of the Islanders over Washington at the Cap Center is indeed a harbinger of things to come.

In 1987 Congress recognized the Long Island Sound as an estuary of national significance. This far-sided program symbolized the committee's and the Congress' understanding of the importance of our Nation's coastal waters.

It is difficult to underestimate the importance of the Long Island Sound. In the many bays and harbors along the North Shore, the Long Island there are swimmers, nearly 1 million boaters, sports fishermen all other manner of water use.

The recreational use of the Sound added \$5 billion to the Nation's economy in 1990, which is the last year that we have complete figures for.

Fifty three million dollars of commercial fish were caught in the Sound and at least \$400 trillion worth of fish got away, if you believe the stories told by the sports fishermen.

Refuges on the Sound attract migrating birds and other forms of wildlife. The Long Island Sound study, with the participation of the EPA and the States of New York and Connecticut, has completed its work and issued a comprehensive conservation and management plan.

The CCMP provides a valuable road map to cleaning up the waters in the Sound, but the study estimates that controlling one of the problems, low-dissolved oxygen called hypoxia, will cost up to \$8 billion or more. Some of this money will be coming on line we hope as the government begins to fund the SRF program. Other funds are being provided by the States of New York and Connecticut, but there is a real need as we are waiting for this money, to begin the process, and especially to create a comprehensive demonstration project to test the technology that is already available.

A legislative commission in New York already has a plan ready to go to develop management practices, for example, in Manhasset Bay. Now technologies are being developed to upgrade sewage plants to meet higher dinitrification standards.

The purpose of land use control is beginning to be understood as is the control of nonpoint source pollution. The Long Island Sound Commission understands what needs to be done and is ready to act.

Our legislation in the Long Island Sound Restoration Act has served as a model to other estuaries as their plans are completed. Our plan calls for an investment of \$250 million over a five-year period. This would include a 70 percent Federal contribution, a 25-percent State match and a 5-percent local match.

Demonstration programs would target certain important bays and harbors on both sides of Long Island Sound. The goal would be to rejuvenate these areas. The States working in conjunction with the Long Island Sound management committee would develop a process for choosing when areas would participate.

We will target areas which are heavily used, have wide varieties of fish and wildlife and are vital to the health of the communities. It is important to note that the solutions created will be comprehensive in scope.

Improvements would target sewage treatment issues, floating debris, pollution from boaters as well as other problems. We would also address land use issues, education and restoration and construction of important waterfront facilities.

Nonpoint source pollution would be at least important as point source as we estimate that 50 percent of the nitrogen loading in the Sound comes from nonpoint sources. Approved plans would encourage greater use of such techniques as buffer strips, stricter land use protection, and the placement of sediment and runoff basins. We would give priority to wetland and other important wildlife habitat. The idea is to see how various techniques and technologies can be integrated.

We would hope that this would not only point the way for the effective implementation of the Long Island Sound Study but all efforts to improve our coastline. This plan could serve as a model for other areas.

Mr. Chairman, we hope—hopefully, we are at an historic moment with an administration and a Congress both having an enhanced understanding of the importance of environmental protection. And we also believe that spending of this sort provides tremendous dividends in environmental protection, jobs, and the quality of life. It will continue the work of the Clean Water Act in restoring this very important waterway.

This committee, Mr. Chairman, wisely spent \$12 million on the study of the Long Island Sound in the Clean Water Act. What now?

We don't get clean water just from studying. It is time to begin to act on the recommendations of the study that you funded.

We thank this committee for leading the effort.

Mr. APPLGATE. Thank you very much, Gary.

I think what we will do is scoot on over to Chris Shays.

I just mention that Chris, who represents Bridgeport and part of the Connecticut coastline, and they do have a joint statement pretty much interested in the same things. And Chris is a Member of the Budget and Government Operations Committee.

Mr. SHAYS. Thank you, Mr. Chairman and Members of the committee.

I would just add to the comments made by Mr. Ackerman, and thank you for conducting these hearings and I recognize the very important work that you are doing.

During the course of the Long Island Sound Study, we were shocked to learn the tremendous amount of money we might have to spend on sewage treatment plants to deal with the direct source pollution, and we began to realize that it is simply not going to happen. And what started to happen as a result was that communities were seeing ways that they could get some of the nitrogen out of the water without spending hundreds of millions of dollars. And we learned, for instance, in the City of Stamford, Connecticut, which I represent, that they were able to go to secondary plus and get 70 percent of the nitrogen out of the water stream by simply going to a program which they called "nitrification denitrification" for \$10,000. They used the excess capacity in the plant and brought the effluent back and were able to get 70 percent of the problem.

It is mine and Mr. Ackerman's feeling that we have a lot to learn in dealing with this issue and rather than having communities all over the country going to tertiary treatment that we could go to secondary plus. But the way to do that is to learn from other sewage treatment plants.

So our program would be in fact a study. It would have established, as was pointed out, six demonstration programs where we would do not only the point sources but the nonpoint sources. We feel by doing this that your committee can save hundreds of millions of dollars, in fact, billions of dollars by learning what works and doesn't work.

In the Long Island Sound area it has been pointed out that we have 14 million people. We are losing the Sound. We know we have to take action.

We know other communities have to. We know that this is one estuary out of over 100 around the country. We know that we get 75 percent of our fin and shell fish food from the estuaries. Tremendously important in terms of a source of food and recreation.

We would really hope that your committee would recognize the absolute essential nature of having demonstration programs where we do the work and then learn from it.

I conclude my statement by saying to you that these demonstration programs would involve monitoring what we are doing and reporting back, and from that, we believe that you will learn ways to save literally billions of dollars in knowing what works and knowing what gets the biggest results for the least amount of money.

Thank you.

Mr. APPLGATE. Thank you very much, Chris.

Apparently, as you say, the nonpoint sources, that is really the big problem that we are having throughout the entire country.

The sources of nitrogen, are those just basically rural or where does it primarily come from? Does that seem to be the biggest—

Mr. SHAYS. Let me say that when we look at point sources that about 33 percent of all the nitrogen contributed into the Sound comes from point sources. The nonpoint sources is 68 percent. But out of the 68, 44 percent is natural. It happens anyway.

The enrichment, the man-made contribution is 24 percent. And we are talking about runoffs from our roads, our parking lots, we are talking about septic systems that aren't a direct point source—not the sewers but the septic systems. And what our bill would do is mobilize the community and take, for instance, a harbor, deal with the sewage treatment plant, which will take the most amount of dollars, and then it would mobilize the rest of the community to look at the septic systems, look at the road runoff, what factories are contributing, and monitor what they are doing, and see what we are doing in terms of boats themselves and what they are contributing. It would be a total comprehensive plan.

We might make a significant reduction in our nonpoint sources with very little money, but we don't really know because we have never tried it.

Mr. ACKERMAN. I might add, Mr. Chairman, if I may, that one of the intriguing parts of the diversification of the communities that are on the Sound in the six projects would be collected one from the County of Nassau, one from Suffolk, one from the City of New York, one from Westchester and two from the State of Connecticut. So you have a regional approach that you were alluding to earlier.

Mr. APPLGATE. As you pointed out earlier, you both have a lot to learn. And if you think that you do, you can stand in our shoes, as you do on your own committee's, and you listen to all the experts out in front of you who do know a lot more than we do. We have a long way to go. And then we have to take and finalize it into some kind of legislative form, and we hope to God that we are going to be right in what we do and make it work.

Mr. SHAYS. If I could make one point. If the committee views the \$250 million over five years as greater than they could fund, you could take the same demonstration program and make it three

projects instead of six. But it is absolutely essential that we begin the process of having demonstration programs.

Mr. APPLGATE. We will be dealing with all of those things. And, of course, the money part will be something that we will have to get into. It is going to be a little bit difficult, but we are going to work on it.

Does anybody have any questions that you would like to ask?

Mr. Clinger.

Mr. CLINGER. No questions.

I would like to commend our colleagues for a very substantial contribution to our work and recognize the extraordinary value of the Long Island Sound as a principal body of water in this country that needs to be protected.

Thank you.

Mr. APPLGATE. Any questions from the Democrat side?

Thank you very much for your expert testimony. It was very, very good. And certainly will be useful to us.

Mr. ACKERMAN. Thank you.

Mr. APPLGATE. We are blessed in having Pete Visclosky from neighboring Indiana, and a very powerful Member of the Appropriations Committee. He has always been interested in meeting the clean water goals and environmental issues and it is going good to have you before the committee.

#### TESTIMONY OF HON. PETER VISCLOSKY, A REPRESENTATIVE IN CONGRESS FROM INDIANA

Mr. VISCLOSKY. Mr. Chairman, thank you very much. I appreciate the opportunity to appear before yourself, Mr. Boehlert, as well as the other Members of the subcommittee.

The congressional district I represent in Northwest Indiana has abundant rivers and wetland, and it is the home of the Indiana Dunes National Lakeshore. These natural treasures coexist with a major urban industrial center.

The district that I represent produces more steel than any State in the United States of America. I am keenly aware of the importance of balancing our efforts to improve Northwest Indiana's and the Nation's water quality with the economic development concerns.

Towards that goal, I would like to focus the subcommittee's attention on legislation I am introducing today to expedite the cleanup of our Nation's waters. The National Clean Water Trust Fund Act of 1993 would create a trust fund established from fines and penalties and other monies collected through enforcement of the Clean Water Act, to help alleviate the problems for which the enforcement actions were taken.

Currently, there is no guarantee that fines or other monies that result from violations of the Clean Water Act will be used to clean up the water. Instead, the money goes into the general fund of the U.S. Treasury.

I am concerned that EPA enforcement activities are extracting large sums of money from industry and others through enforcement of the act, while ignoring the fundamental issue of how to pay for the cleanup of the water pollution problems for which the penalties were levied. If we are really serious about ensuring the successful

implementation of the Clean Water Act, we should put these enforcement funds to work and fully clean up our Nation's waterways.

Specifically, my bill would establish a National Clean Water Trust Fund within the U.S. Treasury from fines penalties and those monies including consent decrees obtained through the enforcement of the act that would otherwise be placed in the general fund. Under the proposal the EPA administrator would be authorized to prioritize and carry out projects to restore and recover waters of the United States using the monies collected from the violations of the Clean Water Act.

However, the legislation would not preempt citizen's suits or preclude EPA's authority to undertake and complete supplemental environmental projects as part of settlements related to violations of the Clean Water Act or other legislation. For example, last month Inland Steel announced a \$54.5 million multimedia consent decree which includes a \$26 million SEP and a \$3.5 million cash payment to the U.S. Treasury.

I strongly support the use of SEPs to facilitate the cleanup of environment problems that are particularly prevalent in congressional districts such as mine. However, the bill would dedicate the cash payments to the Clean Water Trust Fund.

The bill further specifies that remedial projects be within the EPA region where enforcement actions were taken. I think that is particularly important to the Great Lakes States, the Midwest and Northeast, States like Ohio, Indiana and New York.

To illustrate how it would be effective in cleaning up our Nation's water, I would like to highlight the magnitude of the fines that have been levied through enforcement of the Clean Water Act. Nationwide, in fiscal year 1992, EPA assessed \$61 million for penalties under the act. These penalties represent 43 percent of all penalties assessed by the EPA under various environmental statutes.

In Region 5 alone, in fiscal year 1992, the EPA collected \$2.270 million in civil penalties for violations of the Clean Water Act. These funds were the result of five consent decrees and 11 administrative penalty orders. So far this year, EPA Region 5 as collected over \$2 million in civil penalties.

I am pleased to inform you that the legislation has already garnered the endorsement of several environmental organizations in Northwest Indiana, and I am encouraged by the initial indications of potential support within the national environmental community and Northeast-Midwest Congressional Coalition.

I would add, however, there are no specific endorsements that have been made of the legislation by any of these groups to date.

I would also like to point out that in a 1992 report to Congress on the Clean Water Act enforcement mechanisms, an EPA working group recommended amending the Clean Water Act to establish a National Clean Water Trust Fund.

I would also ask that the hearing record remain open that additional comments could be received on the proposal.

Finally, this morning I would like to focus your attention on why we believe it to be part of the solution in approving the Clean

Water Act. However, we know all too often the magnitude of the challenge is staggering.

I would like to emphasize my strong support for improvements in and increased funding for programs to address contaminated sediment, remediate waste water treatment control of storm water discharges, combined sewer overflow policy in the reauthorization. There is no question that all of these issues need to be addressed.

However, it is less clear how States and municipalities and other political subdivisions are going to be able to comply with the more stringent Federal mandates.

I recently surveyed local officials in my district to understand their various needs as well as the costs that would be involved. I was informed that the price tag for necessary projects in the First Congressional District of Indiana, would be over \$118 billion.

Mr. Chairman and Members of the subcommittee, clearly you have your work cut out for you. I respect the efforts that you have put forth to date, and the energies that have been exhibited here and would want to support your efforts.

Thank you very much.

Mr. APPLEGATE. Thank you very much, Pete.

I would also mention that Pete is a very active Member of the Steel Caucus we have. And, in fact, is Chairman of the Executive Committee of the Steel Caucus. And has been very active and is a Member on that Steel Caucus.

We both understand the importance of the infrastructure to the steel industry, as well as all other industries, and in this regard, with regard to clean water and clean drinking water and other aspects of infrastructure directed that way, how important it is. And it is a constant struggle.

I have steel mills in my area and I have serious water problems in my area, too. In fact, the whole country has a lot of problems with regard to that. And the enormity of it shows up when you are trying to sit down and figure out how much money it is going to take to try to make the corrections. And it is a long, long-term and a big-bucks project.

But, hopefully, we will be able to come forth working with some of the other committees to find a resolution to it.

But I thank you for your statement. It was very, very excellent. It will mean a great deal to us.

Does anybody have any other questions?

Mr. Poshard.

Mr. POSHARD. Mr. Chairman, I don't have any questions of Pete, but I do have a statement for the record that I would like to either read or enter into the record for the present time, and ask unanimous consent to enter it into the record.

Mr. APPLEGATE. It will be made a part of the record.

[Mr. Poshard's prepared statement follows:]

#### STATEMENT OF HON. GLENN POSHARD

Mr. Chairman and fellow members of the Subcommittee, thank you for the opportunity to present to you my views and concerns about the impact of the Clean Water Act on rural America. I appreciate the fact that the reauthorization of this Act is of utmost importance to this Committee and to the nation.

This Subcommittee has heard several days of testimony regarding the needs of small, rural communities. I would like to add my voice to the chorus asking for

funding mechanisms and perhaps, new approaches to helping the small, poor areas of the county. Ny new district, the 19th in Illinois, is predominantly rural in nature with many coal mines and farms. Many of the counties in my district have chronic, double-digit unemployment. Therefore, these counties and municipalities simply do not have the tax base nor the economic resources to construct wastewater facilities to comply with the Clean Water Act.

Small communities also need a single source of assistance to provide help in grant applications, packaging of loans, and other economic as well as technical assistance. I would ask the Subcommittee to consider re-instituting a limited grant program or set-aside program for small, rural communities. I would suggest that a separate fund for rural wastewater facility projects be established so that these poor, rural towns do not have to compete directly with the larger, more urban areas of the nation. Last year, Robert Roe, Chairman of the Public Works and Transportation Committee, introduced H.R. 4175, the "Jobs" bill. I worked with Mr. Roe on an amendment to that legislation, the "small communities amendment." This was intended to be a set-aside program for small communities which would ensure that communities under 15,000 in population would receive at least ten percent of the proposed funding as contemplated in H.R. 4175. This set-aside would create a modest funding source to help small communities defray the cost of planning projects and help put those projects into grant and/or application form. Rural governments generally do not have local, in-house planning capacity and need a reimbursement provision to help defray these costs.

I have just held a meeting in the northern part of my district to discuss the organization of a regional water district for the counties of Christian, Macon, Moultrie, and Shelby. This area is in desperate need for a reliable water distribution system as well as wastewater treatment systems. But they are also a poor, rural community and will need Federal and State assistance to accomplish this goal. The City of Charleston has already completed an engineering study, at their own expense, to determine costs relative to an extended sewage line as a means of encouraging industrial development. As I have mentioned, these areas of Illinois have high unemployment and need assistance, both technical and financial, to help their citizens have a cleaner, safer environment.

Mr. POSHARD. Thank you very much.

Mr. APPLGATE. Pete, thanks again, and we will be looking forward to working with you further on this.

We are privileged to have here Congresswoman Marcy Kaptur and Congressman Ed Pastor.

Well, it is always a privilege to have my favorite Congresswoman and favorite lady, and really a very active person with the Ohio delegation, but also nationally. She has served on committees with me, and I have been privileged to be able to receive some good advice from her, on the Veterans Affairs. But now she is on the Appropriations Committee, having gone to Appropriations from the Budget Committee, and she has done so much with so many agencies with regard to the environment. She has been a very strong supporter of the environmental and economic benefits of the Great Lakes and she also was the Cochair of the Northeast Midwest-Coalition, so she is a very active lady and it is nice to have you here.

#### **TESTIMONY OF HON. MARCY KAPTUR, A REPRESENTATIVE IN CONGRESS FROM OHIO**

Ms. KAPTUR. Thank you, Mr. Chairman. It is a pleasure to testify before your subcommittee this morning and to other Members that are here.

I have to say to have one of the Members of our delegation chair such an important committee is a pleasure for me. And I can't think of a more capable Member to take the reigns, and we look forward to working with you.

As you know, I sit on the Subcommittee of Appropriations that has jurisdiction over the Environmental Protection Agency. And I

wanted to restrict my remarks this morning to specific recommendations I have, and then to talk a little bit about the relationship between the Great Lakes and our border with Canada, and the proposed NAFTA agreement and our border with Mexico, in relation to some of the programs that are authorized through your subcommittee.

Let me ask unanimous consent to submit my full remarks for the record and I will summarize.

Mr. Chairman, I first wanted to draw your attention to the importance of the Great Lakes which you have already noted in your opening statement. I would urge you as strongly as I could, to continue the efforts of your subcommittee and specifically designate Great Lakes initiatives as a part of the work of the subcommittee.

We know that 95 percent of the Nation's fresh surface water is concentrated in this region of the country, and my recommendations are as follows: First, a second phase of the Assessment and Remediation of the Contaminated Sediments Program be included in the legislation. As you know, this program demonstrates sediment remediation technologies on a pilot scale at five of the 43 Great Lakes Areas of Concern. And the only one in Ohio is Ash-tabula right now.

By authorizing a second phase, more sediment treatment technology demonstrations could be embarked upon at the pilot level and full scale. And I would recommend that the program will have some sort of technical and financial assistance and outreach to communities which have contaminated harbors, and we have a lots of those on the Great Lakes.

I would ask your committee's cooperation in developing a requirement on the Corps of Engineers' work through the EPA to develop tributary transport models of soil run off for each major river system feeding a Great Lakes Harbor. One of the problems is knowing where the watersheds are that cause the most problems of runoff and we would hope that information could tell us where to identify high-priority watersheds for intensive nonpoint pollution abatement work.

And finally, I would ask to you take a look at conditioned and expanded incentives to encourage the agricultural community to practice conservation tillage and reduce its use of fertilizers and pesticides. I can tell you that the Section 319 grant program has been very, very welcome by our rural community, and I have been surprised by the ability of the farmers through the Soil Conservation Service to work with EPA.

EPA and the wetlands issue, is not a real popular agency in the rural community and yet this program appears to be working and has long-term benefits due to the contaminated runoff problem that we continue to have. Those are my recommendations on the Great Lakes.

In the area of waste water treatment, and combined sewer overflows, I would want to echo some of the comments made by previous speakers in that we do need enhanced financial assistance for small communities sewage facilities.

So many of them just can't afford the cost of this, and my testimony documents some of the problems in my own district. And I would ask that the combined sewer overflow problems be addressed

in a manner that employs site-specific flexible standards that balance both the environmental needs as well as the costs and the economic situation of our local communities.

It is really difficult to know how to help our local mayors, for example. The City of Toledo is currently involved in some sort of litigation with EPA, where they had to pay out three quarters of a million dollars in fees. And as I see this, I think, why don't they put the three quarters of a million into the sewer project? Why are we spending all of this money in the fines, and so forth?

So I think some sort of recognition of what these local communities is facing would be helpful.

I would like to limit the amount of money going to lawyers, if we could. I would recommend preservation of the planning set-aside from the Revolving Loan Fund Capitalization Grants, Section 604(b), and that the mandatory pass-through of funds to regional planning agencies should remain in place at a reasonable level and would ask your committee's consideration of establishing a similar planning set-aside for nonpoint source Section 319 funds.

These planning funds should also have a mandatory pass-through to regional planning agencies at a reasonable level of funding.

Mr. Chairman, finally I wanted to go back to the Great Lakes issue, if I might, and submit some information for the record, which we just got from the Environmental Protection Agency.

I apologize for not being able to put it into my testimony for the record this morning. But I have been very concerned about the amount of money that we are spending out of general revenues for cleanup at the U.S.-Mexican border. And for several years I have been trying to get information out of EPA and other governmental agencies to look at what we are spending on the U.S.-Canadian border, versus what we are spending at the U.S.-Mexican border; how we are funding it; who is paying for it.

I have been surprised at how difficult it is to get the information out of the administrations that have served in trying to figure this out. For example, we know that within EPA this year, they are going to take about \$164.1 million for NAFTA-related Mexican border improvements.

Government wide, there will be \$231 million, which is a \$13 million increase over last year. And the amount of money we will be spending as taxpayers to take care of border-related issues at the U.S.-Mexico border, I have spoken to the the new EPA Administrator as to how that compares to the U.S.-Canadian border. I have learned that we are taking money from general revenues to fund border cleanup, compared to the fact that in our region of the country where we have Superfund sites, that Superfund cleanup is being funded through a tax.

And yesterday I asked Administrator Browner, there is this Tijuana waste water project that has been going on for several years. We have appropriated \$124.2 million for a sewage treatment plant in Tijuana, Mexico. And I asked Ms. Browner, could you please explain to me how I can justify that to my mayor who is being fined by the EPA because he can't pay for all the infrastructure necessary, and all he gets is a loan program, not a grant program. Her answer was the reason we can take money from general revenues

is because the Tijuana river flows north, and therefore, the sewage ends up in the United States.

So my question to her was, and I am going to submit this in the form of a written question to her—the Niagara River flows north into Canada, but we don't fund a sewage treatment plant in Canada. So there seems to be continental inequity in the way that we fund cleanup as it relates to industrial development and population centers on the continent.

I would like to submit information to your subcommittee on the different ways in which we are funding this treatment at the border versus the Great Lakes Region, and to perhaps work with your subcommittee in a way to gain equity in terms of how we pay for this necessary cleanup. And I am going to be encouraging the EPA Administrator to look at the "polluter pays" concept as a way of trying to fund this cleanup and not take money from general revenues. And as an example of that, I use Dura Corporation, which left Toledo, Ohio, and which has left us with cleanup programs. And Dura has now located in northern Mexico and they are probably going to do the same thing down there.

But the company that did us harm will now move into your region and do the same thing.

I think, Mr. Chairman, this is a very important issue for your subcommittee to take I look at. And we would be happy from the appropriation side to provide you as much information as we can, and it has been very difficult to obtain.

So my last point is to try to gain continental equity in terms of how we pay for this cleanup. And right now I don't think that the system is fair to our region of the country.

Mr. APPLEGATE. Thank you very much Marcy.

I would like to have whatever information that you have, because I did not know that and \$124 million in the Tijuana Waste Water Treatment Facility—

[The information submitted by Ms. Kaptur follows:]

## NAFTA/MEXICO BORDER - TOTAL U.S. COMMITMENT

**Question:** What is the total U.S. government investment in FY 1994 supporting NAFTA environmental commitments?

**Answer:** The total U.S. government-wide request is approximately \$231 million, an increase of \$13 million over the 1993 enacted level. Seventy percent of this funding (or \$164.1 million) is contained in EPA's budget. This includes \$150.0 million for construction grants for wastewater and drinking water projects.

### Background:

Resources -	Estimates FY 1993	FY 1994	
EPA	<u>\$154.0</u> 32.5	<u>\$164.1</u> 90.0	Construction of Tijuana wastewater treatment (\$70M); projects in Nogales, AZ, Calixico, CA, other border projects.
	60.0	60.0	Colonias assistance
	11.5	10.1	Tech assistance, training, enforcement
	45.5		Sau Diego wastewater treatment
	4.5	4.0	Estimated salary, travel & expense dollars (based on Agency-wide averages)
USDA	<u>\$25.5</u> 25.0 0.5	<u>\$29.2</u> 25.7 3.5	FHA grants to Colonias (matched) Tech assistance, forest agreements
Interior	<u>\$0.6</u>	<u>\$0.9</u>	Cooperative ventures with Park Service, U.S. Fish and Wildlife Service
HHS	<u>\$1.6</u>	<u>\$1.6</u>	Enforcement/Inspection - FDA
State	<u>\$36.4</u> 26.1 5.4 4.9	<u>\$35.3</u> 26.1 5.5 3.7	On-going IBWC projects O&M Export/Import Bank credits/guarantee US AID technical assistance

### EPA's 1994 MEXICO BORDER/NAFTA ACTIVITIES

**Question:** What is EPA's 1994 AC&C request for its combined Mexico Border and NAFTA activities?

**Answer:** Our request AC&C request is \$10 million, which includes the Agency's combined Mexico Border program (without construction grants) and NAFTA activities.

**Background:**

o Resources:

- Breakout of the \$8.1 in AC&C Mexico Border funding by office is as follows:

OIA	\$ 4.3 M	Completion of first stage of IBEP, technical cooperation, (see attached page)
OAR	\$ 1.5 M	Enhanced air quality monitoring
OE	\$ 0.1 M	Training U.S. and Mexican Customs (most of OE's \$\$ in this area is in PRO)
<u>OSWER</u>	<u>\$ 2.2 M</u>	Monitor import/export of haz waste, haz waste technology transfer
<b>Mexico Border AC&amp;C Total:</b>	<b>\$ 8.1 M</b>	

- Breakout of the \$2.0 million in AC&C funding for NAFTA activities is as follows:

OE	\$500K	cooperative enforcement actions and training
OSWER	\$500K	import/export surveillance, hazardous waste technology transfer, etc.
OPPE	\$100K	environmental statistics and data exchange with Mexican Government
OAR	\$200K	alternative fuels and inspection and maintenance programs
OIA	\$250K	technical cooperation and assistance to develop environmental infrastructure
OW	\$200K	to hold a joint conference on industrial and municipal water pollution
<u>OPPTS</u>	<u>\$200K</u>	information exchange on pesticide residues on food exported to the U.S. from Mexico
<b>Total</b>	<b>\$1.95 million</b>	

OIA's \$4.3 million for Mexico Border Activities will provide the following:

- o Direct programmatic support to EPA's regions VI and IX for binational work group activities in the areas of air, water, hazardous waste, emergency response, and pollution prevention
- o Coordination of environmental education initiatives to Mexico as well as the newly established EPA-SEDESOL technical personnel exchange program
- o Development of an environment and energy technology clearinghouse for the U.S. Mexican border
- o Initiation of a study to examine strengthening state and local policy making and enforcement capacity in Mexico through decentralization

CA 42.6

NAFTA Request Broken Down by Office

<sup>1</sup>International Boundary and Water Commission, Department of State

<sup>2</sup> Section 510, Clean Water Act, authorized appropriations for a San Diego wastewater treatment plant to treat Tijuana sewage. EPA FY93 appropriation's bill caps the Tijuana facility at the current estimated EPA responsibility of \$239.4 million; appropriations through FY93 total \$124.2 million.

<sup>3</sup>The U.S. Public Health Service (PHS) initiated a study through the U.S.-Mexico Border Health Association to assess current health programs and resources along the border. The findings, issued in 1991, identified environmental health as one of the six main health concerns in the region. To ensure continuing attention to environmental health issues is the Border Plan, SEDESOL and EPA are initiating regular consultations with the PHS and others.

Ms. KAPTUR. To date and last year our Appropriations Subcommittee capped the amount of money that we could spend at \$239.4 million.

Mr. APPELEGATE. We have yet to appropriate that?

Ms. KAPTUR. That is right. Out of general revenues.

Mr. APPELEGATE. That adds to the debt. I am sure Phil Gramm will have something to say about that. But that is very, very surprising.

What is the cost—did you get me a cost on the figure of the border cleanup as overall cost as compared to—well, of course, the Canadian?

Ms. KAPTUR. That is what we are trying to get, Mr. Chairman. I will try to supply some information for the record on that.

We got information yesterday from EPA so I have not had a chance to verify all of this, but the total U.S. Government-wide request for NAFTA environmental commitments this year, for the 1994 budget, is \$231 million, of which 70 percent or \$ 164.1 million is contained in EPA's budget.

Mr. APPELEGATE. Well, it seems to me that the countries of origin should be the one who is are totally responsible. And it seems to me that Mexico should be the one that is responsible of anything flowing into the United States. We should be for anything flowing into Canada.

Ms. KAPTUR. That is right.

Mr. APPELEGATE. But that apparently isn't the same. We have two different standards here. And I think it is very important that this be looked into and investigated. And the committee will do that.

I will be glad to work with you and I want to get all the information that I can on it.

Ms. KAPTUR. Thank you, Mr. Chairman.

Mr. APPELEGATE. And I would only say that I am very happy for the information that you have given to us to this point. And for your whole statement. Because it was very, very good. It was full of facts and figures.

I appreciate that, Marcy, very much. It was very well articulated.

Mr. Boehlert.

Mr. BOEHLERT. No questions.

Mr. APPELEGATE. Mr. Filner.

Mr. FILNER. Mr. Chairman, thank you.

And thank you, Marcy, for being here, and I have appreciated working with you in my few months here in Congress. I would hope as we move into solution of these problems, we don't end up pitting one part of the country against the other.

Coincidentally, I happen to represent the district in which the waste treatment plant is being built. It is not in Tijuana; it is in the United States in the City of San Diego. And let me say, it is something that I am glad you brought up, because we are going to have to deal with it.

Through the middle of my district, which is along the border between Mexico and the United States, 16 million gallons a day of raw sewage flow through my district.

I don't think any other district in the country can say that. So what do we do about it?

For 30 years we have been saying that it is Mexico's problem, they have to take care of it. I am proud to say as I Member of the San Diego City Council for the last five years, I finally was able to address the needs of my constituents, then and now, by figuring out a way to treat that sewage and get a commitment to work with Mexico to build a waste treatment plant on our side of the border, where the health and safety of at least 125,000 of my constituents is being endangered.

My constituents have malaria, encephalitis, asthma, other things. I would like all of you to come to my district and not only see the raw sewage, but smell it and live with it. It is something that we have to take care of in some way, and EPA and others have finally decided that with the growth of the City of Tijuana from 1 million to maybe 3 million now, although nobody knows for sure, they can't treat the sewage. And it is not the fact that the river flows north, it is the fact that sewage flows down hill, and we are at a lower level than the City of Tijuana in San Diego.

So as we look at the very real issues, the border areas and Great Lakes and, you know, I am working with you on the NAFTA situation, but I have very severe health and safety problems for well over 100,000 people, and no district in the country could say that they have this situation. Mexico simply cannot handle it technologically and financially.

In fact, by the way, you say who pays for what; the City of San Diego is now paying for treating of that sewage, which I engineered as a Member of the City Council, when the Federal Government has signed a pact to pay for it. There is no appropriation to pay for it. Soon the City of San Diego is going to turn off that treatment and endanger again the constituents that I have to serve.

So I appreciate your concern on the issue. But we have to find ways to deal with it without pitting ourselves one against the other, in working for your situation, but also those of us on the border that have been neglected for 30 years.

It has just escalated with the population growth of the City of Tijuana. It is a little bit more complicated—

Ms. KAPTUR. Will the gentleman yield?

I had the opportunity to visit your district and Tijuana about two years ago, and I couldn't believe what I saw. And I think what continues to trouble me is that those responsible for generating that waste are putting that burden on the citizens of San Diego. And really the citizens of the United States, because we are using general revenues to pay for this. And the "polluter pays" concept, which is something that we have embedded in law for funding other environmental cleanup efforts, really is not embedded in this proposal. And as the administration negotiates this environmental side agreement, whatever it is, this to me is absolutely an essential part of it, because it is too much of a burden and there is an inequity in the way that we are trying to finance these cleanups around the country. I doubt that this is the only place along the border where there is a problem.

Mr. FILNER. I agree with you that the so-called free trade agreement would just exacerbate that situation and make it just a disaster, more so than it is now.

I appreciate, Mr. Chairman, and Ms. Kaptur, I hope that we can all focus on these issues because people in all parts of the country have neglected them. And I will work with you for equity in financing but we have to pay attention to all of these areas.

Mr. APPLGATE. Thank you very much, Mr. Filner.

I certainly don't want to pit one part of the country against the other, but we have to find out why there is such a disparity here and find out why it has worked one way with one country and another way with another country, how that doesn't make sense. And the taxpayers, of course, have to continue to foot the bill, and right now they are not in much of a mood to be paying their tax dollars for other countries's benefits. As you can see, we are having difficulty with Russia and some of the others that want money.

Mr. Menendez has joined us. Do you have any questions?

Marcy, thank you very much.

I'm sorry. Mr. Horn.

Mr. HORN. I would like to say, I didn't hear all of your testimony, but I was impressed by the latter part that I did hear. I think you make an excellent point, as does my colleague from California.

I happen to support the North American Free Trade Agreement, but that doesn't mean that we want environmental pollution. And I certainly hope that we could constrain any future pollution. And as far as any past pollution go, if we could easily fine the polluters, fine. But what I would hate to see with this law is where most of the efforts and energy going to cleaning up the pollution are to lawyers arguing this out in court.

I think we ought to face up to solving the problem, and I would hope in this bill and every other bill that comes to Congress that we do exactly that and get rid of it, because as Congressman Filner says, this is a major public health program, no matter where it is.

Ms. KAPTUR. With will gentleman yield?

I am curious, where did the concept come in to penalize these mayors who don't have the money? They are trying to build these facilities as fast as they can. We had a heavy rainfall, we had discharge into our two rivers and into the lake, and so they got fined. They are building the combined sewer overflow facility. Our whole downtown is being dug out underneath. They weren't finished. I am missing something why these heavy fines could be levied on these cities that are trying.

Mr. HORN. I think the Chairman is the one that is going to have to answer that one.

Ms. KAPTUR. Well, I will have a private conversation with the Chairman.

Mr. APPLGATE. Who directed the question to me, to the Chair?

Anyway, I agree with you, Marcy, that here we are—I could name a couple of horror stories concerning EPA and fines and enforcement, and putting municipalities, on the other hand, a very strict mandate, and then say, If you don't do it, we are going to fine you so much per day. Sometimes the fines end up more than the worth of the whole village or community. And I can show you a couple of examples in my own area.

So I think we have to use some common sense in these approaches.

So, if there are no other questions, thank you very much, Marcy.

Ms. KAPTUR. Thank you.

Mr. APPLGATE. We are also privileged in having one of our newest members, Ed Pastor from Arizona. And he, of course being a supervisor of his county board of supervisors, is very familiar with some of the problems facing the counties. He serves on the Energy and Water Subcommittee of Appropriations, which is good, and a person that we need. Also, the committee which has jurisdiction over the civil programs of the Corps of Engineers. So that fits in with our work, too. And he has been very active in the environmental field.

We are looking forward to hearing what you have to say to us.

### TESTIMONY OF HON. ED PASTOR, A REPRESENTATIVE IN CONGRESS FROM ARIZONA

Mr. PASTOR. Good morning, Mr. Chairman. I want to thank you for the opportunity to speak to you today. I have prepared detailed written testimony which I would like to submit for the record with your permission.

My purpose this morning in appearing today is to seek the subcommittee's support to establish a Regional Water Quality Research Project in Pima County, Arizona, to deal with a major problem faced by 17 States through the arid West.

As you know, under the Clean Water Act, the EPA is charged with the responsibility of developing water quality criteria documents. These documents serve as guidance to the States, who are responsible for establishing specific water quality standards throughout the United States.

Over the years, the EPA has adopted water quality criteria based on scientific research primarily conducted for wet ecosystems. The EPA has used that same criteria for navigable waters located in arid States.

This policy is causing great problems throughout the arid West, where dischargers are facing the very real possibility of having to spend billions of dollars to construct new, or retrofit existing, wastewater treatment facilities to treat stormwater and effluent discharges. There is little indication that such expenditures will result in any net environmental benefit to the region.

The EPA criteria is intended to achieve fishable, swimmable water quality standards. While these standards make sense in wet ecosystems which are full of fish and other aquatic life, it makes absolutely no sense in arid ecosystems which do not support such species and where the majority of the navigable waters of the U.S. are merely dry riverbeds throughout most of the year.

Governmental and private entities throughout the West want to abide by the Act. That is, they want the EPA and the States to establish valid water-quality standards based on scientific data obtained from arid ecosystems. This would ensure that the EPA's water-quality criteria was established on the basis of the existing ecosystem.

Pima County authorities have developed a proposal to establish a Regional Water Quality Research project to conduct laboratory, ephemeral stream, and field research on the impact of effluent and storm-water discharges on the flora and fauna of arid ecosystems.

Pima County is requesting that the subcommittee authorize 5 million dollars in fiscal year 1994 to begin the project. The 5 million would be used to plan and design the facility, establish a biological laboratory, and to establish a water-quality monitoring program for storm water. Pima County is prepared to contribute up to half million dollars in matching funds to the project.

Mr. Chairman, as you noted, I am a Member of the Energy and Water Appropriation Subcommittee. Two days ago, the Secretary of the Interior, Bruce Babbitt, stated that this problem facing discharges in the arid West needs to be addressed within the context of the reauthorization of the Clean Water Act.

In closing, I ask that the subcommittee honor Pima County's request to proceed with the study and construction of the water-quality research project. The authors of the Clean Water Act recognized that water-quality criteria and water-quality standards should be established on the basis of accurate scientific research.

There is only one true way to achieve that degree of accuracy, and that is to conduct the research on the effected ecosystem.

Thank you very much, Mr. Chairman. I will be happy to respond to questions.

Mr. APPLGATE. Thank you very much, Ed. That is a very good statement.

What you are doing is you are making common sense and that means a great deal.

Mr. PASTOR. It is a major problem, because national standards are usually developed in the Midwest, the East Coast, or maybe the southeast part of the country. When you try to apply these standards to the arid West, they often don't make sense, and if cities and counties are required to meet these EPA standards, it is going to be very expensive.

So we just want to ensure that the data that these guidelines are being based on actually relates to the effected ecosystem.

Mr. APPLGATE. You say in order to implement this study it would take about 5 million?

Mr. PASTOR. Yes, sir, to begin construction of the facility and have the proper monitoring.

Mr. APPLGATE. I have an idea you will probably get that.

Mr. PASTOR. Thank you. I appreciate that.

Mr. APPLGATE. I don't know that we will authorize it, but you will probably get it.

Mr. PASTOR. We don't authorize in the Appropriations Committee, Mr. Chairman.

Mr. APPLGATE. Is that a fact? I appreciate you saying that. I will pass that on to Mr. Natcher.

Mr. Boehlert.

Mr. BOEHLERT. No questions.

Mr. APPLGATE. Mr. Horn.

Mr. Menendez.

Mr. PASTOR. Mr. Chairman, one more minute please.

Mr. APPLGATE. Sure.

Mr. PASTOR. This deals with a similar problem to that of San Diego's that I have in Nogales, Arizona. Several years back, an international waste treatment plant was constructed in Nogales, Arizona. At that time they felt that it was economical and efficient

to take the wastewater from Nogales-Sonora, Mexico and treat it at the plant in Arizona.

What has happened, due to national policy, is that the maquiladora population in Nogales, Sonora has increased tenfold. And so the problem that we have in Nogales, Arizona, is that the wastewater treatment plant that was built is now very near its capacity. The EPA has recommended funding for expansion of this plant.

I just want to make this comment so that when you look at some of the border situations, they exist because of national policy having a negative environmental impact on border communities.

Mr. APPLGATE. That is very true. Thank you for your input on that, Ed.

Next we have two of our very good colleagues with us, Frank Pallone of New Jersey and Eleanor Holmes Norton from Washington, D.C.

It is good to have you both before the committee.

Frank Pallone was elected to replace Jim Howard and is a former Member of this committee, but since has moved on to Energy and Commerce. And so we miss seeing you on the committee, anyway, Frank. And it is good to have you here and we are anxious to hear what you have to say.

#### TESTIMONY OF HON. FRANK PALLONE, A REPRESENTATIVE IN CONGRESS FROM NEW JERSEY

Mr. PALLONE. Thank you, Mr. Chairman. I appreciate being welcomed back and I really do feel like this committee is my home. I look around at the portraits that you have of Jim Howard and Bob Roe and Mr. Anderson, and it is nice to be back here.

I came because I really wanted to talk about the enforcement issue. And essentially, I would like to see during the reauthorization process very similar to the enforcement mechanisms that we put into State law in New Jersey in a bill that I responsored when I was in the State legislature, and use that as an example of what could be done on the Federal level.

I see that my colleague Mr. Menendez is here and I am sure he is familiar with the Clean Water Enforcement Act that was passed in the State legislature in New Jersey.

I have a written statement. I am going to summarize parts of it. If I could put the whole statement in the record, I would ask unanimous consent to do that.

Mr. APPLGATE. Without objection.

Mr. PALLONE. The Clean Water Act has not attained its goal because dischargers of toxic and other harmful substances, even when they have vastly exceeded permit levels, have not been sufficiently penalized for their acts. In far too many cases, they have not been penalized at all because the EPA has misused its wide discretion to set or not to set penalties for violations of the act.

With agonizing consistency, EPA has either ignored violations altogether or compromised on fines and penalties to such a degree that violators have been able to derive benefit from polluting our waterways. That is, industry has found that paying lenient fines for Clean Water violations is often cheaper than investing in proper pollution control equipment and complying with the law. And my

feeling, Mr. Chairman, is that without a mandate for strong enforcement, essentially industry often finds that it pays to pollute.

What I am saying today is in part based on the report that was done by the General Accounting Office which confirmed this. They said that enforcement of our Nation's water quality laws continued to be weak and sporadic. Despite serious and longstanding violations, most enforcement actions are mild slaps on the wrist rather than formal actions such as administrative orders or fines and penalties. Further, even in the relatively few case where penalties have been assessed, they are significantly reduced or dropped without adequate documentation.

A similar statement in May 1989 by the EPA Inspector General. I am not going to read that, but I believe that inadequate enforcement of the Clean Water Act undermines our advances in improving water quality. We must do better and unless we create incentives by enacting mandatory minimum penalties, removing the economic incentive for industries to remain out of compliance, adding stronger reporting and inspection provisions and empowering citizen actions or citizen suits, we will continue on this downward trend.

Basically those four points are the essence of H.R. 3429, the Clean Water Enforcement and Compliance Improvement Act. It was introduced last year with a number of cosponsors and will be introduced again in the next few weeks with a slightly more expanded version in order to implement this.

It is modeled on the New Jersey law that was passed in 1991, and New Jersey basically found as a result of the law that there is now an economic benefit in pollution prevention. That is what we are trying to create that actually polluters will feel that there is a benefit to preventing pollution. And since that time the state has heralded its success in its annual review.

I am saying that not only do we have a model on the state level, but it has been in effect and there are reports to see how it has worked out. We are not just giving you something that has not had a test run.

In March the state reported that the 1992 data concerning inspections showed a trend towards compliance by more facilities. The number of facilities which inspections found unacceptable decreased from 792 in 1991 to 505 in 1992.

In 1992, permit holders moved to more substantial compliance with the Discharge Monitoring Requirements. The number of violations for failure to submit discharge monitoring decreased from 59 to 38 in 1992. And basically, these self-reporting requirements are at the heart of the state legislation and the proposed Federal legislation. In other words, in the past basically every six months they would average their figures where now they are required to report on a monthly basis the violations. And this has led to more frequent inspections, to quicker action, to preventive actions that are taken before more serious violations occur.

The state has increased permit actions by 140 percent They have eliminated duplicative permits, issued new permits, renewed, modified or terminated permits. These up-to-date permits will undoubtedly yield great environmental benefits.

To get to the heart of the legislation, it basically requires mandatory minimum penalties of \$1000 per violation per day for serious violators. For a significant noncompliance, a mandatory minimum fine of \$5000 per violation per day would be set. And the EPA would no longer have a discretion to not calculate economic benefits.

We are trying to eliminate the discretion, Mr. Chairman, and we are basically saying that they have to calculate economic benefit in setting the standards in all this. They cannot reduce punitive damages by more than 25 percent.

I don't have to schedule you how much money Congress has invested in pollution prevention and the billions of dollars in upgrading water treatment facilities over years, but because industrial discharges to publicly owned treatment works are largely unregulated, industries have been granted a license to pollute as long as their discharges pass through a POTW.

So we are also changing in this law, and I would like to see it changed in the reauthorization, that the monitoring reporting requirements not be less stringent in POTWs, so all facilities discharging to ground waters, surface waters, or treatment works must submit discharge monitoring reports monthly.

You understand what I am talking about? Industries use the fact that they are sending their wastewater into a POTW as an excuse for less reporting requirement.

I wanted to talk about a few more things and then I will close; one is citizen suits. The Department of Justice has credited citizen groups for their valuable public service in seeking compliance with the Clean Water Act. And I specifically mention the New Jersey Public Interest Research Group which over a four-year period recovered nearly \$6 million. Nationwide, \$9.7 million in penalties and interest has accumulated because of citizen suits.

But there has been a problem and my bill seeks to remove the obstacles that are contrary, I believe, to congressional intent. Congress has provided that any citizen may commence a civil action against any person alleged to have been in violation of the act, but that was undermined by the Supreme Court in Chesapeake Bay Foundation vs. Gwaltney of Smithfield, Ltd., I believe they undermined this provision which they said this meant citizens cannot sue for wholly past violations.

This has had a chilling result. Industry, rather than coming into compliance, waits until citizens file a notice of intent, and then if that violation is cured within the 60-day period, it is considered, a past violation they can't bring the citizen suit.

I am asking that a change be made in that. We made a similar change last session with the Clean Air Act. I have also asked that we adopt the EPA regulation clarifying that state enforcement actions may not bar the imposition of Federal judicial penalties. And we are seeking to clear the definition of citizen standing and include a finding and definition which seeks to end any preemptive barring of citizen access.

As I said, I think that citizens should have access to as much public information as possible. That is what citizen involvement is all about. If they don't have the information, they can't bring citizen suits. So we have included language in the proposal to require

posting the waterways which do not meet standards or in which fish and shell fish consumption is banned.

What I have done at the end of my testimony is to summarize the key components of the legislation. I am not going to run through that again because I have highlighted what I think is most important. But I am concerned about one thing.

I saw some of the Appropriations people were here previously. In the proposed budget there are significant cuts which I think will affect enforcement. So I believe that in part because there may be less money for enforcement, that that means that this type of legislation which will allow for better enforcement in ways that doesn't necessarily imply additional funds is that much more important. And that is why I mention that about the budget.

In conclusion, essentially, the reasoning of this legislation is pretty simple. If it becomes plain that violators will be held accountable and that it is no longer safe to assume the EPA will either ignore violation or assess tacit penalties, the industry will begin to see an economic benefit in pollution prevention.

That is the only way that we will realize the goal of the Clean Water Act and basically the efforts that this committee has expended on the Clean Water Act for the last 30 years.

Thank you, Mr. Chairman.

Mr. APPELGATE. Thank you very much, Frank.

A couple of things. You, of course, basically are interested in strong enforcement, and I can understand the problems that you have. You want to set a minimum, which is okay, but you also want to extend or expand the maximum fine.

And Marcy Kaptur was here a while ago just saying that the daily fines are far too great and too great a burden for small communities to be able to withstand, and they are hurting. She was I think very articulate in drawing some comparisons to other things throughout the country.

But you also, in trying to make this a little bit more stringent too, you are talking about—and this is something I think that may—as a matter of fact, Mrs. Holmes Norton may want to listen in on this, too—and that is to include fines for anticipated violations. And I am not sure how that is going to sell and if it is consistent with due process or any other aspect of criminal law, and there are any examples of penalties for anticipated violations.

Mr. PALLONE. You know, I actually went to dinner last night with some individuals who brought that up to me. And I frankly didn't understand, you know, why they assumed that to be the case in the bill. I don't know if I could—I mean, it is interesting because in the last few days, I guess perhaps in anticipation of testimony of this bill being reintroduced, that concept has surfaced.

But I can't answer you Mr. Chairman other than to get back and see why, you know, it is being alleged that we are going to be penalizing people for a violation that hasn't occurred.

Mr. APPELGATE. Well, it is interesting, and I would like to hear from you.

Mr. PALLONE. Absolutely, I will be talking with you.

Mr. APPELGATE. I thought when you said that you went out to dinner last night, you were anticipating that they would pick up the bill, and they didn't. And if there are any other examples that

you might be able to supply to us, I would be interested in seeing them.

Mr. PALLONE. We will get back to you.

Mr. APPLGATE. I have a little bit of a problem on that, but I would like to hear what you have to say on that.

Mr. Menendez.

Mr. MENENDEZ. I don't have any questions. But I do want to commend my colleague from New Jersey, who represents one of the gems of New Jersey, the New Jersey shore, which is not only a natural resource for New Jersey, but also a tremendous economic resource. So when Frank Pallone talks of clean water, it is certainly of concern for all of New Jersey, and of course the standards that we want to achieve are penitentiary for the Nation.

And so I commend you for your constant vigilance and stalwart ideas to make sure that we accomplish the goals that we want to be working on this problem.

Mr. PALLONE. Thank you, and I would like to say that in New Jersey, the problems of clean water have never been perceived by the members of the state legislature as being confined to the shore area. And when we were working to eliminate the ocean disposal of sewage and sludge, some other basically long-term efforts to eliminate ocean pollution, that we had tremendous support from then Senator, and I guess before that Assemblyman, Menendez and a number of people from the North Jersey area, and I appreciate that.

Mr. APPLGATE. Mr. Nadler.

Mr. NADLER. Thank you, Mr. Chairman.

Let me also commend the gentleman from New Jersey, Mr. Pallone for his testimony and his initiative in this bill. And let me say that I am also very concerned personally about the clean water in New York and also in New Jersey, since I spent eight or nine years growing up in Ocean County, in Jackson Township. I don't know if that is Mr. Pallone's district.

Mr. PALLONE. It is not now, but I used to represent Jackson County.

Mr. NADLER. You talk about empowering citizen lawsuits by eliminating some of the barriers currently. Does your bill include or have you given thought to awarding court costs and lawyers fees to successful citizen plaintiffs?

Mr. PALLONE. I believe we do that. In fact, one of the things that I didn't mention, but—I at least didn't mention in my oral statement—I think it is in the written—but it is certainly in the bill, is that in the past a lot of the money—money has been awarded as a result of citizen action suits and a lot of times it is used for pollution prevention because those citizen organizations will then donate it for that purpose.

One of the things that we put in the bill is that we would actually authorize the courts to do that, to actually award the damages, so to speak, toward pollution preventions in various ways.

Mr. NADLER. Thank you.

And secondly, you talk about point sources of pollution discharged through secondary treatment plant, in other words, where you simply discharge some pollutant, chemical, whatever, and it gets filtered through a pollution treatment plant.

We have a slightly different problem that I am thinking of and I want to ask whether your bill addresses this. That is, you have areas where the treatment plants, especially in the Hudson River in New York, for example, are way over capacity. That is to say that the sewage, raw sewage, not particular pollutants, is too much for the existing plants, and whenever it rains, it goes over.

I forget the technical term, but it goes over the banks or whatever and raw sewage spills into the Hudson, and yet we have very large-scale developments coming down the pike that will increase the overcapacity of some of these treatment plants from 130 percent to 140 percent.

What can we do? Does your bill address this? What do you think we can do to make sure that either in limiting new development or anything else, to make sure that we are simply not treating the water at one end, but overloading our treatment facilities at the end so that we don't get any net gain?

Mr. PALLONE. Well, the bill doesn't address that, but if I could talk about it briefly, in New Jersey, and I assume in New York as well, historically, if a new subdivision went in and there wasn't the capacity to treat the sewage that would come out of it, they would simply have bans or moratoriums on new construction, and that was very true in Ocean County as well as Monmouth County in the 1980s and before that. I think it is true, but that is one way of dealing with it.

On the other end—and obviously this is what your committee is looking into—you know, obviously providing more funds to increase capacity and dealing with ways of separating storm drain systems from sewage treatment systems, and if you can't afford the situation, looking at devices to control the storm water either through holding tanks or screening devices, less expensive things than separation, but I am sure you are talking about all of those things.

Mr. NADLER. Would you think it advisable to require in Federal law bans or moratoriums or that the State have a choice of either putting into place increased treatment facilities or some other technical means that you just spoke of, or banning or having moratorium of new construction and forcing that on the State that doesn't have the political will to do any of those?

Mr. PALLONE. Yes, I have no problem with that kind of a Federal law. I am not sure that that isn't already partially the case. It may be that New Jersey enforces those bans only through their own State action or it may be because of some Federal mandate that already exists.

If there are no Federal mandates, I don't have a problem with it. But it is important. And I am sure you share the same view that, we do more on the Federal level.

This committee has authorized levels of funding for loans and obviously I would like to see grants, particularly to the hard-pressed areas, at higher level than has been appropriated. But there again it is a money problem.

Part of the President's stimulus package is to provide more funding for that and you see the problems that we have getting that through. In the absence of having that money available, you may have to continue to have some of these moratoriums.

Mr. NADLER. Thank you.

Mr. APPELATE. Mr. Horn.

Mr. HORN. Thank you, Mr. Chairman.

Legal fees and processes were mentioned. I have got two questions. One, does your bill provide any provision that the loser who brings the claim, if the loser is the one who brings the claim, would have to pay the legal fees of the victor?

Mr. PALLONE. In citizen action suits, no, it does not.

Mr. HORN. As you know, there are a lot of nuisance suits, large, public and private. And there are suits that are often groundless, but they assume that there should be a way you have just to get them off your back as a nuisance.

Mr. PALLONE. I guess I understand what you are saying, but my fear—and I don't know how we would work this out ultimately, because I understand your concern—but my fear would be that particularly knowing some of the citizen groups in my part of New Jersey that are involved in bringing these suits, they are often not only grassroots but underfunded and volunteer and that type of thing.

I would be afraid to create too much of an onerous burden that would discourage the suits, but maybe there is some way to come to a happy medium on this. I understand your concerns.

Mr. HORN. Well, an administrative law process that deals with the problem rather than just having counsel get rich on the process or having punitive damages that really don't apply, but someone feels that there is a deep pocket at the end of the line.

And on your second-to-the-last page, I am curious, what are the different criteria that move one from a serious violator at \$1000 a day to a significant noncomplier at \$5000 a day? How do you work that formula?

Mr. PALLONE. Those definitions are in the existing statute and maybe I could get some help in how they are defined. But they are not new concepts. They are definitions that exist within the current law.

Mr. HORN. Are you just changing the dollar amount?

Mr. PALLONE. The definitions and those terms are terms of art that exist in the current law.

Mr. HORN. Well, we can look that up. I was curious as to what the change was.

Mr. PALLONE. No, not in the definition of terms of art.

Mr. APPELATE. Thank you very much, Mr. Horn.

Frank, thank you very much for appearing before the committee.

Mr. PALLONE. Thank you.

Mr. APPELATE. We will be working with you.

Mr. PALLONE. Thank you, Mr. Chairman and Members of the committee.

Mr. APPELATE. We are also honored to have a very distinguished Member of our committee—and I will get this right, Eleanor. You know, I am getting Norton and Holmes mixed up here, but I will get it right and we will just say Representative Norton.

She has been an outspoken protector of the Anacostia River and she is one of the rare Members of the Congress who chairs two subcommittees, the Post Office and Civil Service Subcommittee on Compensation and Employee Benefits, and the Subcommittee on

Judiciary and Education of the District of Columbia committee. That is quite a distinction. I am impressed with that.

And she very much interested in environmental concerns and not only just in her own District, but also throughout the Nation. And it is good to have you before the committee.

**TESTIMONY OF HON. ELEANOR HOLMES NORTON, A  
DELEGATE IN CONGRESS FROM THE DISTRICT OF COLUMBIA**

Ms. NORTON. Thank you very much, Mr. Chairman.

Chairman Applegate and Members of the subcommittee, I very much appreciate the opportunity to testify today and I will testify briefly and ask that my longer remarks be incorporated into the record.

Mr. APPLEGATE. Without objection, so ordered.

Ms. NORTON. I am pleased to be a Member of this subcommittee and proud of the work that it is doing under our able Chair.

Just yesterday, American Rivers named a river within sight of the capital as the most endangered river in urban America. The Anacostia River ranked high, on what I call the Dirty 10; the 10 most endangered rivers in America. The Anacostia was number 4.

Today I want to propose that the Clean Water Act reauthorization include an urban watershed restoration program similar to the national estuary program which protects smaller tributaries of larger waterways. Given the size and importance of these watersheds, they need and deserve new and separate funding.

Minimally, jurisdictions should have the option of using existing funds for urban watershed restoration. If the new program were to become a part of an existing program under the act such as section 319 nonpoint source program, then every effort should be made to increase those funds.

The watersheds that would be covered are parts of the great cities of America. In a very real sense, these working rivers built America. They have been central to industry and commerce, they have provided drinking water, food and recreation. We have mightily used these rivers and nearly used them up.

I believe that it should be unthinkable to reauthorize the Clean Water Act today without including a more comprehensive approach to the restoration of the great urban rivers. The rivers I refer to deserve a lot of credit for building a strong industrial America. Among them were the Detroit River, the L.A. River, the Flat River in Denver, the Chicago River, and the Hudson River.

The experience that leads to my interest in city rivers is, of course, the Anacostia. In 1991, former Congressman Henry Nowak, who was Chair of this subcommittee then, and Congressman Robert Petri, who was Ranking Member, held a field hearing about the Anacostia in a Washington, D.C. neighborhood bordering the river. That hearing documented extraordinarily strong regional, local, citizen, and organizational activity and support.

For years the Anacostia has attracted successful efforts and cooperation from elected leaders, regional officials and organizations, and from this region's devoted and untiring environmentalists. This rejuvenation activity needs and deserves an appropriate framework under the Clean Water Act if it is to become even more effective.

The survival of city rivers is, indeed, a miracle of nature when we consider the enemies that plunder their shores everyday. The Anacostia is typical, but I shall not run down the terrible problems that plague that river. I leave it to the record to include.

Rivers like the Anacostia cannot fully recover, even with the admirable and energetic mix of approaches that surround restoration today. The starting point, I believe, in this year of reauthorization is to focus on these rivers through special urban watershed restoration programs and not simply through a series of often unconnected grants to State jurisdictions and organizations.

An urban watershed program would have major roles for the Federal Government, the States, and local governmental and citizen groups. Urban watersheds of national significance could be nominated by governors with the concurrence of urban watershed citizen advisory councils and local officials.

EPA would oversee the program, coordinate with other agencies and provide technical and financial assistance to the urban watershed projects. States would administer the Federal grant money, provide additional State grant money, help to train citizens to do water quality monitoring and other components and commit to watershed restoration requirements.

Local governments and local citizen groups would work as equal partners in the restoration efforts to design the individual watershed restoration projects and hire and train innercity youth and others on the ground to conduct the restoration projects and public education activities.

Central to my proposal is citizen involvement. Citizen river restoration efforts already under way along the Anacostia are proof positive that just as all political systems are local, all successful river restoration efforts are also local. It is the people who live near the river who care most deeply and personally about their waterways. All they need are the tools.

Just as the FBI has its 10-most-wanted list, my hometown river in this Capital City of our Nation has gotten the dubious honor of the most endangered urban river in America. However, the Anacostia is but a proxy for all of America's endangered urban rivers. It runs along the banks of the showcase Nation's capital, just far enough from the tourist attractions to be forgotten.

The Potomac became a national embarrassment and got a special cleaning with Clean Water Act funds beginning 20 years ago. The Anacostia, the people's river, the river of the neighborhoods, was ignored, as have the other urban rivers of America.

This year when we are reauthorizing the Clean Water Act, the working rivers of our major metropolitan areas deserve attention. This is the year to give citizens and State and local governments the tools to reclaim the city rivers that have worked on overtime for our country.

Thank you very much.

Mr. APPLEGATE. Thank you very much, Eleanor.

I think you have said pretty much what needed to be said in your statement and you have enumerated it, I think, very well. And we have some problems throughout the States as well as the District of Columbia. The question is how we are going to be able

to address them and in an equitable fashion be able to pay for them all. That seems to be where we are.

We are hoping and we will look forward to working with you as time goes on to be able to include a better program for the District and for doing what it is that you feel is necessary to help to take care of the Anacostia and some of the other problems.

And so I certainly thank you for your very well prepared statement.

Mr. Horn.

Mr. HORN. I just want to thank Delegate Norton for the testimony. We ought to make sure this city and all its parts are a beautiful example for the rest of America. So I thank you for coming.

Having said that, Mr. Chairman, I wonder, with reference to Mr. Pallone's testimony, I am informed by Minority counsel that it is the regulations that really contain the definitions that we were searching for.

Mr. APPELEGATE. Mr. Menendez.

Mr. MENENDEZ. No questions.

Mr. APPELEGATE. Mr. Filner. Nothing? Okay.

You got off easy. You did so well on your statement.

Ms. NORTON. I hope that means that we are going to get an urban watershed project.

Mr. APPELEGATE. Now we will have the Florida delegation. And with us we have Clay Shaw, Ileana Ros-Lehtinen, and Peter Deutsch. Good to see you. Mr. Hastings was here.

**TESTIMONY OF HON. E. CLAY SHAW, JR., A REPRESENTATIVE IN CONGRESS FROM FLORIDA; HON. ILEANA ROS-LEHTINEN, A REPRESENTATIVE IN CONGRESS FROM FLORIDA; AND HON. PETER DEUTSCH, A REPRESENTATIVE IN CONGRESS FROM FLORIDA**

Mr. SHAW. Mr. Hastings was here and I know that the hearings are running longer that you had anticipated. He had a conflict and had to leave, but he has a statement that he asked be put in the record.

Mr. APPELEGATE. All of your full statements will be made a part of the record.

I saw Dante Fascell. I thought maybe he was going to fill in. Did you want to fill in?

We are privileged to have this distinguished group from Florida, and Clay Shaw has been one of the leading Republicans in fighting the scourge of drugs and drug-related crime, and a very strong Member of the Ways and Means Committee, which, we know, is extremely important and is very interested in the restoration of the Florida Bay as well as the Miami River.

Mr. SHAW. Thank you, Mr. Chairman.

I would like to point out that I was also a former Member of this full committee as well as at one time this subcommittee, of which I have very fond memories.

I would like to talk to you for a few moments, and I will ask that my full statement be put into the record so that I won't extend your labors by having to listen to a whole statement. But I would like to talk to you for a few minutes about another form of crime

that has been committed, although albeit a crime that no one really recognized was going on through the years.

As I look around this committee room and look at the great public works projects that this committee has authorized over the years, I think that the time has come now that we must look at what we have accomplished, what is good and what is bad, and try to correct what we have destroyed.

South Florida at this moment is in a world of trouble. There is no question about it, and that trouble starts all the way up around Disneyworld, comes around Kissimmee River and into Lake Okeechobee and into the Sea of Grass, which is known as it is Everglades. The majority of that Sea of Grass is owned by the Federal Government as Everglades National Park. It comes down and dumps into the Florida Bay.

I have had handed out to you, Mr. Chairman, maps showing exactly the location of the Florida Bay. Florida Bay is one of the great natural resources that we have in South Florida. It is the very nursery from which most of our fish life and shell life comes, and it is in trouble, as is the rest of the Everglades.

The Everglades is being overrun by melaleuca, by development, by drainage, by all these things that have been done over the years. These are all well-meaning projects that have been allowed by the private sector as well as projects that have been conducted by governmental bodies over the last 75 or 100 years.

We now are finding that what we thought was an indestructible environment in Florida is not indestructible. It is in big trouble at this particular time, and we are seeing that.

What I would like to address at this particular point is the trouble that is down at very south end of Florida Bay. This lies in Peter Deutsch's district but it is something that the entire Florida delegation has expressed its concern about by cosponsoring as original cosponsors the Save the Florida Bay Act of 1993; thus, showing our joint concern about the future of this natural resource.

To just tick off the problems that we are seeing in this dying body of water; 55 square miles of seagrass in Florida have died since 1987 and this is mostly within the park itself. The number of pink shrimp in the Florida Bay is at a 30-year low. The mangroves and sponges are dying off at an alarming rate. The water is saline and warm, providing an unhealthy habitat for juvenile shrimp, lobster, fish and all the wildlife below the sea.

The nearby coral reefs, which are the only living coral reefs in this country, are endangered and we are seeing the collapse of that most important reef. The most massive algae bloom ever found was recorded last year in the Florida Bay and it stills exists today.

Jobs are being lost as a result of the deteriorating Florida Bay as well as the quality of life that we are seeing. Now, we have, what we are seeing is a warning sign. The bay is not dead, but it is dying and desperately needs attention.

I believe this subcommittee should really put on the top of its list, to go in and take an audit of what is out there, what has happened, what can be done and where we have to try to correct the situation.

We have a very large Federal interest because of the fact of the map that I have handed out to you shows that the Federal Govern-

ment is by far the largest landowner. In fact most of the real estate on the map that is before you is owned by the Federal Government.

It is a wonderful, wonderful natural resource which we must turn our attention to. This particular bill, as well as the project and concern there, has also been addressed by the Governor. His letter of concern and support for this important piece of legislation is part of my statement, which I have previously submitted for the record.

We will be, in the next few weeks, submitting recommendations to you, Mr. Chairman, and to this committee, as to how this should be, in our opinion, addressed in the legislation that you are considering. What our intention is today is to focus the subcommittee's attention on this most important natural resource and the tremendous danger that it is in.

I don't know how the Chair would proceed. I would answer questions, or if you prefer, perhaps it would be better to yield to my colleagues so that they will have a chance to testify.

Mr. APPELEGATE. If there are any time constraints, we of course do them individually as the Members would desire, but you are here as we group and we could just listen to the testimony from the other two and then just ask some questions.

So we will go to Congresswoman Ileana Ros-Lehtinen.

Ms. ROS-LEHTINEN. Thank you, Mr. Chairman.

I am pleased to have this opportunity to testify before this subcommittee in support of the Save the Florida Bay Act of 1993 to protect our Florida Bay, a body of water which is of critical importance to the entire State of Florida. And it is of importance State-wide because it affects the environmental health of our Everglades.

The Florida Bay is one of our most essential natural resources. I urge you to support this because the immediate action is necessary to decrease the rapid deterioration of the Bay. As we speak, there is massive seagrass die-off and the abundant growth of algae threaten the economic character of the commercial and recreational fisheries in the area.

Additionally, our country's only living coral reef system located in the Florida Keys is threatened by this declining water quality. Lack of fresh water drainage and disturbance of the natural flow of water in the Florida Bay have caused many environmental problems.

I request that this subcommittee acknowledge the need to save our Florida Bay and consider Save the Florida Bay Act of 1993 as an essential provision to the Clean Water Act.

I look forward to working with my colleagues and the subcommittee to save this indispensable natural resource, and I congratulate Congressman Vento who has worked so hard on a problem that is not in his district.

Thank you.

Mr. APPELEGATE. Next, Representative Deutsch.

Mr. DEUTSCH. Thank you, Mr. Chairman.

It is a pleasure to be here with my distinguished colleagues, particularly Congressman Fascell, who is present today. As we talk about South Florida and Florida Bay itself, that area of the country is almost a living testament to his success and involvement. The fact that Florida Bay itself is owned by the Federal Government,

and is part of the National Park System, is a tribute to his 38 years in the U.S. Congress.

The destruction of Florida Bay is an interesting problem that we are facing. Your first questions may be why today and why not three years ago and why not four years ago? And why all the sudden has it reached this crisis magnitude?

In fact, there is an ecological explanation in terms of seagrass and types of seagrass which have taken over as a result of the salinity change. Because fresh water is not reaching the Bay, the water becomes hypersaline, causing seagrass to die off.

There is a crisis in one of America's great natural resources right now. I am meeting with Secretary Babbitt about Florida Bay this afternoon. This crisis is on his agenda, and is on the President's agenda.

We have a treasure in America that is dying, and its death has occurred exponentially over the last year and a half to two years. We have the opportunity and, the responsibility, to try to do something to save Florida Bay.

The resources of the Federal Government have solved much more serious problems than what exists in Florida Bay at this time. I think we are a united delegation from Florida and hopefully will be united as a country in addressing the issues to save Florida Bay.

Mr. APPELEGATE. I have statements here from Representatives Alcee L. Hastings, and Harry Johnston of Florida, for inclusion in the record.

[Statements referred to follow:]

ALCEE L. HASTINGS  
23D DISTRICT, FLORIDA

**Congress of the United States**  
**House of Representatives**  
**Washington, DC 20515-0923**

STATEMENT OF THE HONORABLE ALCEE L. HASTINGS  
of Florida

Before the  
HOUSE PUBLIC WORKS AND TRANSPORTATION  
SUBCOMMITTEE ON WATER RESOURCES AND ENVIRONMENT

GOOD MORNING, MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE. I APPRECIATE HAVING THE OPPORTUNITY TO TESTIFY BEFORE THE SUBCOMMITTEE ON BEHALF OF THE "SAVE THE BAY ACT OF 1993".

THIS BILL IS DESIGNED TO RESTORE THE FLORIDA BAY, ONE OF THE MOST PRECIOUS HABITATS ALONG THE EAST COAST. CONGRESSMAN SHAW'S LEGISLATION AMENDS THE FEDERAL WATER POLLUTION CONTROL ACT TO PLACE FLORIDA BAY ON THE EPA NATIONAL ESTUARY PROGRAM'S PRIORITY LIST. FURTHERMORE, THIS BILL ESTABLISHES A COMMITTEE TO OVERSEE THE FACILITATION OF FLORIDA BAY RESTORATION AS WELL AS ENLIST FLORIDA BAY AS PART OF THE COASTAL AMERICA PROGRAM. THIS PROJECT, WHICH HAS ALREADY BEEN AUTHORIZED, REQUIRES APPROPRIATIONS IN THE AMOUNT OF \$3,000,000 FOR FISCAL YEAR 1994.

THE FLORIDA BAY HAS BEEN CRIPPLED BY MAN AND IS CURRENTLY IN GREAT PERIL. THE POPULATION OF MARINE LIFE HAS DECLINED SIGNIFICANTLY, MOST NOTABLY SEA-GRASSES, SPONGES, AND MANGROVES. IN ADDITION, A HUGE ALGAE BLOOM IS SPREADING ACROSS THE SURFACE OF THE FLORIDA BAY. THE SCIENTIFIC COMMUNITY HAS CONCLUDED THAT

THE PROBLEM IS DUE TO A SHORTAGE OF FRESH WATER FROM THE EVERGLADES. OTHERS SPECULATE THAT THE MAIN PROBLEM IS WATER QUALITY.

A TEMPORARY PUMP WAS INSTALLED IN 1992 TO INCREASE ADDITIONAL WATER, BUT HAS BEEN INEFFECTIVE IN SERVING MANY WATER-STARVED AREAS. WITHOUT REGULAR FRESHWATER INFUSIONS, FLORIDA BAY'S WATERS - WHICH ARE NORMALLY LESS SALTIER THAN THE OCEAN - BECOME WARMER AND SALTIER THAN SEA WATER. FURTHERMORE, SCIENTISTS ARE CONVINCED THAT THE BAY WATERS FLOW THROUGH THE FLORIDA KEYS AND OUT ONTO THE CORAL REEF. THE EXTREMELY SALTY BAY WATER WILL HAVE AN EFFECT OF THREATENING THIS NATION'S ONLY LIVING CORAL REEF SYSTEM IN THE FLORIDA KEYS. THE FLORIDA BAY WHICH WAS ONCE A MARINE MEADOW WITH CRYSTAL CLEAR WATERS AND ABUNDANT FISH IS NOW RAPIDLY BECOMING A "DEAD ZONE" AVOIDED BY FISHERMAN. CONDITIONS IN THE BAY ARE NOT CONDUCIVE TO THE SURVIVAL OF YOUNG SHRIMP, LOBSTER, AND FISH. THIS HAS HAD A CHILLING EFFECT ON THE STATE'S LARGEST COMMERCIAL AND RECREATIONAL FISHERIES, AN IMPORTANT MEANS TO INSURING THE REGION'S ECONOMIC STABILITY.

WE MUST IMPROVE AND PROTECT THIS VITAL ECOSYSTEM WHICH SERVES AS A CRITICAL HABITAT FOR PLANT AND ANIMAL SPECIES. AS THE BAY IS GRADUALLY IMPROVED, IT CAN RETURN TO A STATE WHICH MAINTAINS AN EXTRAORDINARY VARIETY OF ORGANISMS, PLANT LIFE, AND

FISHERIES. THE FLORIDA BAY IS A PRECIOUS COMMODITY AND A VITAL  
NATURAL RESOURCE TO THE STATE OF FLORIDA.

I THANK THE COMMITTEE FOR YOUR TIME AND CONSIDERATION.

House Subcommittee on Water Resources  
Testimony of Rep. Harry Johnston  
Save the Florida Bay Act of 1993  
April 21, 1993

Mr. Chairman, thank you for this opportunity to share with you and the members of the Subcommittee my views concerning the environmental crisis in Florida Bay. I regret that I am unable to provide my views in person, but hope the following comments will encourage your support for the "Save the Florida Bay Act of 1993."

The critical state of the Bay is reflected by increasing public insistence to act immediately. In recent years, we have witnessed dramatic biological changes: the die-off of seagrass meadows, mangrove habitats, sponges, shellfish, and other marine life. Acres of algae mats have provided an alarming visual confirmation of the Bay's distress.

The death of Florida Bay will precede the end of a way of life in South Florida. The Bay is the northern neighbor of the Florida Keys National Marine Sanctuary, which was designated to preserve the imperiled Keys coral reef. The reef, a delicate colony of marine life, is an irreplaceable treasure. At best, less-than-concerted action to address this problem will further strain the "web of life" -- a metaphor which does not refer solely to the marine ecosystem. The human consequences are equally serious. Just ask the fishermen, shrimpers, divers, and residents of the Keys.

Loss of the seagrass habitat alone already has impacted many economically important fish and shellfish species. The Bay ecosystem supports the livelihood of thousands of commercial and sport fishermen, attracts millions of tourists, and promotes hundreds of millions of dollars of spending in the state each year. These are only a few reasons to seek a solution for what is, sadly, a man-made problem.

In the course of Florida's rapid development, our ignorance of the importance of the greater Everglades ecosystem's water flow has resulted in mismanagement and the loss of half of the original wetlands. We now are seeking to reverse this damage.

Effective treatment for the Bay will evolve from our current partial understanding of the reasons for the biological imbalance. Most scientists agree that Florida Bay's ill health is produced by a synergy of factors. Problems stemming from the quality, quantity, timing, and distribution of fresh water flows pervade the system from the Kissimmee River to the plankton-choked waters of Florida Bay. As a result, there simply is no "Florida Bay fix." We need a coordinated, committed interagency effort to produce an effective plan for the greater Everglades ecosystem.

In January, Interior Secretary Babbitt proposed the formation of a task force to undertake a comprehensive research program into the causes of the biological changes in the Everglades system. This working group will act as the vehicle for a science-based solution,

conducting monitoring and water quality studies. A long-term, comprehensive approach will include steps to redirect essential fresh water flows to the Bay.

The "Save the Florida Bay Act" will support the Administration's proposal to establish an interagency working group. It authorizes \$3,000,000 to conduct a targeted study of the Bay's problems, including the impact of Hurricane Andrew. This report, which will be submitted to Congress, will provide guidelines for further research to restore healthy hydrological conditions in the Bay. This legislation also will include Florida in the Coastal America program, and make the state eligible for priority consideration under the National Estuary Program, which prioritizes wetlands for preservation.

I hope you will support this effort to restore the Florida Bay ecosystem to its original majesty. There is no replacement for this inheritance. In the words of Marjorie Stoneman Douglas, "There are no other Everglades in the world."

Thank you for reviewing my comments.

Mr. APPLGATE. Okay. I thank you very much for all of your statements. It really is a very, very serious problem, I can see.

The map isn't much that we can look at, but it shows the tip of it down here and it shows the Florida Bay in blue. Is Florida Bay, is the whole of Florida Bay a park or just parts of it, or what?

Mr. DEUTSCH. All of Florida Bay is included within the Everglades National Park. The boundary of the park includes all of Florida Bay.

Mr. APPLGATE. You say that there is an explanation. What is the explanation? I mean for this—

Mr. SHAW. To try to understand the problems of what is going on in Florida Bay, you have to go all the way up, as I mentioned in my earlier testimony, all the way up to Disneyworld and the Kissimmee River. The Kissimmee River many, many years ago was channelized, which drained off a large part of the northern part north of Lake Okeechobee.

From that, there has developed a great deal of surface water drainoff in an agricultural area, which is predominantly cattle farms. The dairy industry is very strong up in there.

What has happened over the years, Lake Okeechobee, which I can remember as a youngster as a clear lake, you could walk out in the lake and see your feet. I have heard people say that in 10 feet of water, you could read the date off of a dime. That is no longer true. You cannot find the dime now if you drop it.

Then when you go south of Lake Okeechobee, there is a great deal of agricultural activity. That is taking place in the south end of the lake. This developed with the demise of the trade with Cuba. With Castro coming in, a lot of the sugarcane industry developed in that part of Florida.

There is a lot of finger-pointing as to who is responsible, but there is also a question which has to be addressed, which is the very livelihood of South Florida, its underground rivers. The Biscayne Aquifer which runs through there, is the area from which all of southeast Florida gets its fresh drinking water and that runs of course under the Everglades as an underground river.

We need to understand better the drainage that has occurred. We found that our coastal cities, their deep wells, now, they are having to move further and further inland because of the salt that has come in and contaminated these particular wells.

The whole system has to be looked at as far as what is going on down there in South Florida. The problems are abundant.

We are seeing great change in the Everglades. We are seeing great change in the water birds that nest there. We are finding tremendous change in them and they are leaving that area. By just altering the depth of the water, you see the various water birds with various length legs, those legs are adapted to certain depths of water. That is changing. The whole thing is changing and desperately needs our attention.

The Federal Government, because of its large interest in the Everglades National Park, which Peter referred to as including the area of our immediate concern, is the agency that should go forward and be responsible for coming up with some plans to solve some of the problems.

Now, I might say that one of the things that you will hear from the people in South Florida, that these things have been studied to death and now is the time to go forward with the implementation of a plan.

I think that an audit and an inventory of the various studies should be made and perhaps it would be well if this was made jointly by the staff of this committee as well as the Department of the Interior in cooperation with the South Florida Water Management District, the State of Florida, and other agencies that are concerned down there, to try to come up and implement a way to go forward.

Mr. Chairman, I would like to invite you and Members of your subcommittee to come down to Florida and have some hearings and actually go on to the waters, go on to Florida Bay and see firsthand what is happening down there, see the problems that we are very concerned about that will give you a greater appreciation of the natural resource that this country owns and has a tremendous responsibility as a steward of this great natural resource.

Mr. APPLGATE. So has this process been going on—I guess it has increased more with the population and industrialization of Florida as time goes on?

Mr. SHAW. Well, the algae bloom that appeared in great quantity last year, the die-off of so much of the seagrass which is the natural filter as the water comes south, we are seeing all of these things happening. And they are warning signs that we are dealing with a dying natural resource.

You know, if you want to go back and try to pinpoint, I guess, you would have to go back and start talking about Henry Flagler who made it easier for the early population of South Florida to come southward with the advancement of the railroad and the Canal Company that dug out our waterways coming south. And of course many of your constituents now are adding to the problem by coming to South Florida, which they are certainly welcome and we love to see them, but our population is continuing to grow, and we need desperately to have a plan as to how we are going to solve some of the tremendous problems that are becoming worse and worse. And the problem is growing at a tremendous speed.

Mr. Florida Keys himself, Dante Fascell is here today, and he did not come here to testify, but perhaps he would have something from a historic perspective, something that he might like to add, and I would certainly invite him to join us if he cares to. It is great to see him.

Mr. DEUTSCH. Mr. Chairman. If I could follow up, the way I hear your question, the Everglades system, as Congressman Shaw ably discussed, has been dramatically affected by human development over the last 75 years. The phenomenon of the degradations of the Bay itself; because there is no fresh water flow into the Bay, there is an algae bloom that exists in the Bay which is huge. And it did not exist a couple of years ago. The actions of man over 75 years have changed the flow of water through the Everglades and into the Bay.

The Everglades is a river of grass. "Everglades" is River of Grass in Indian language. It is the only Everglades in the world, the only such ecosystem in the world. As the sheet flow has come south, it

is not the natural system anymore. Florida Bay itself is not getting both the quantity of fresh water and the seasonal adjustment that occurred in the past.

The South Florida Water Management District, which is a State agency with an interaction with the Federal Government through the Corps of Engineers, is trying to address this problem. But the phenomenon is related to the Bay itself. It is important to look at the crisis as the result of the change in the entire Everglades ecosystem. This system begins North of Lake Okeechobee and the Kissimmee Basin. What is happening in the Bay is caused by fresh water not coming down through the river of grass.

Specifically, the bay itself is at a crisis level. It has occurred. It's not something that has become worse and worse over the last 10 years. There has been an exponential degradation over the last two years or so, and that is the ecological phenomenon, which continues to worsen.

We have to look at the system as a whole, but the specific things that we can do to the Bay are much less expensive and much more immediate and much more critical.

Mr. APPLEGATE. Let me ask you, Clay, what is the status of the dechannelization of the Kissimmee River that was authorized last year?

Mr. SHAW. The river is in process now, the Kissimmee River, of being dechannelized. And there is a lot of fussing going on about it. There is no question about that. When you start doing that, you are going to start flooding some of the lands that were drained. But I think that project has been going forward.

I would like to also comment, there are two Senators in Florida who are very active on this particular subject and they will be filing their own bill over in the Senate addressing this same subject, so there will be a companion bill on that side.

Mr. APPLEGATE. Your bill establishes a committee of various agencies to try to coordinate the roles in the Florida Bay, but how does Florida itself fit into that process?

Mr. SHAW. Well, the State of Florida has been very active. The Governor has been very concerned about this and he has been working on this particular project.

Peter, you might be able, just being out of the Florida legislature, you might be able to state how the question is being addressed.

But I think, Mr. Chairman, you can understand that when you are talking about the different forms of jobs as you go up the State, different forms of enterprises, particularly the agricultural industry, it has been a very sensitive issue. It has been a very hot political issue. There have been many hearings and people trying to come up with compromises.

It appears that some progress has been made with the sugar people up around Lake Okeechobee, but the bottom line has to be that the Florida Everglades and the Bay must be saved, and if we have to step on some toes then that is going to have to happen.

Florida is a top agricultural State, but still we have to conduct ourselves in a responsible manner, taking into consideration the continuation of the natural resources that we do have and be sure that we do not destroy these natural resources just because one industry has a louder voice than another.

The primary concern that we must have in government is the salvation of the natural resource of the Everglades, the Florida Bay, Lake Okeechobee and of course the water supply for all of South Florida which is affected by what we do.

Mr. APPLEGATE. Your agricultural industry is very large in Florida. I didn't realize how big it was. And particularly in dairy and cattle, beef-cattle. I understand it is the largest beef-cattle State in the United States.

Mr. SHAW. It either is or is certainly one of them. Yes, sir. It is a tremendous industry.

Mr. DEUTSCH. Mr. Chairman, just to give you a sense of the Federal and State role, and how complicated these issues really are, the Federal Government actually sued the State of Florida. Congressman Ros-Lehtinen's husband was the District Attorney for that part of Florida at the time. The Federal Government sued the State of Florida for polluting the Everglades Park.

As a result of the suit, the State and Federal governments have entered into a consent agreement as to actions of the State in the park. In fact, EPA administrator Browner was the Director of the State Environmental Agency that negotiated in that agreement.

So the State is involved. In terms of jurisdiction, the land north of the park is generally State conservation areas. And again, the water management district, which has a huge geographical jurisdiction, and is a State agency appointed through the Governor's office, controls the flow of the water through the canal system in South Florida.

I believe that the State is very much committed, but it also is clearly the Federal Government's role and responsibility to force the issue. It has to happen through us. It is our responsibility. I can remember worse problems which this committee has been part of solving, in terms of cleaning up problems, even just dealing with it ecologically. I look at that Bay and then I know we can save Florida Bay.

We need to know more as well. While there are scores of colleges that are working on, for example, Chesapeake Bay, and that is not the case with Florida Bay right now. As a resource for this country, I don't think it has been given the resources that it needs in relationship to its importance.

Mr. APPLEGATE. Well, I appreciate your input. I guess the more that you look at it, the more that you realize what a terrible problem that there is. And we have yet to sit down and really put together what it is that we feel is necessary to take care of the individual problems of the States, but Florida will certainly get—they are going to be right up there with priorities, too.

Mr. SHAW. Mr. Chairman, don't forget our invitation to come south and see us.

Mr. DEUTSCH. It is really a case of a picture being worth a thousand words. To physically see the algae bloom from the air is actually a better sight than even being on the water. When you are there, you can really get a sense of the problem.

Mr. APPLEGATE. It is better to go south than north, especially in the dead of winter.

Thank you again.

Congressman Oberstar was to be here today, but he is tied up with other hearings, and without objection, his statement will be made a part of the record.

[Mr. Oberstar's prepared statement follows:]

STATEMENT OF HON. JAMES L. OBERSTAR  
SUBCOMMITTEE ON WATER RESOURCES  
COMMITTEE ON PUBLIC WORKS  
Hearings on Clean Water Act  
April 21, 1993

Mr. Chairman, thank you for the opportunity to appear before you, to speak on behalf of my draft Nonpoint Source Pollution Prevention Act, legislation to strengthen the nonpoint source provisions of the Clean Water Act.

We have just been given a timely and dramatic illustration of the need for this legislation. In the last few weeks, thousands of residents of Milwaukee, Wisconsin, were stricken by a flu-like illness, traced to the protozoan *Cryptosporidium*. This is a waterborne organism which entered the city's drinking water system, in all probability, from a farm on a tributary to Lake Michigan, from which Milwaukee draws its water, and passed through the treatment system unhindered.

We call such disease organisms, toxics, sediment and nutrients, which originate on farms, forests, construction sites, city streets and mines "poison runoff," or "nonpoint source pollution." It is the last remaining major gap in Clean Water Act pollution control measures.

Though outbreaks like the one in the Milwaukee are not common, they are far from rare. EPA reports 76 such outbreaks of waterborne disease, striking 67,000 people, in the 5-year period 1986 to 1990. EPA stresses that these figures grossly under-represent the real incidence of such diseases.

While drinking water treatment must remain the first line of defense against waterborne pathogens, pollution prevention in this as in every other case could reduce the costs of water purification, spare our citizens the possibility of disease from organisms that get through the treatment process, and reduce industry costs as well.

The Federal Water Pollution Act Amendments of 1972 set the nation on its current cleanup course. As Committee Administrator at that time, I find myself now the only Member of Public Works and Transportation who remembers and contributed to the effort that went into its enactment.

The first line of that landmark legislation, in Section 101(a), declared it the objective of the Act "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." Congress added, in the 1987 amendments, "it is the national policy that programs of the control of nonpoint sources of pollution be developed and implemented in an expeditious manner so as to enable the goals of this Act to be met through the control of both point and nonpoint sources of pollution."

Since 1972, American citizens as Federal and State taxpayers have spent \$75 billion to clean up municipal point sources. Through 1989, industry, and citizens as consumers, have spent over \$130 billion on cleaning up industrial point sources, including \$67 billion in capital expenditures and \$63 billion in operating costs. Ninety percent of municipalities, and 95% of industry, currently comply with the Act.

Yet, despite that costly sacrifice, and high compliance rate, fully one-third of the Nation's assessed waters have not attained water quality standards. Less than half of our total waters have been assessed, meaning that a much more significant though unknown number of waterbodies are impaired, and more are threatened.

The major cause of this failure to meet the standards is nonpoint sources of pollution -- or poison runoff -- the unfinished agenda of the 1972 Act.

The National Research Council has estimated that the total economic costs associated with agricultural runoff alone are between \$2 billion and \$16 billion per year -- and this is only one category of nonpoint sources! As this Subcommittee well knows, the Army Corps of Engineers alone spends about \$450 million a year dredging sediment from our harbors and waterways. Many industries have to treat water before they use it because it is too befouled for their processes. They treat it again at the end of their process and return it cleaner at the outfall than at the intake. How much cheaper to keep pollutants out of the water in the first place!

Mr. Chairman, it is time to complete the task set forth in 1972, to attain the objective of chemical, physical and biological integrity of the nation's waters, and to make sure that the American people, who have already paid so dearly, get their money's worth in terms of fishable, swimmable waters, or as the Act more elegantly if ponderously terms it, "protection and propagation of shellfish, fish and wildlife, and recreational activities in and on the water."

As author of Section 319 of the Clean Water Act, Nonpoint Source Management Programs, which became law as part of the 1987 Amendments, I have developed and circulated a discussion draft of new legislation which would strengthen Section 319, treat nonpoint sources with the same determination as we have addressed point sources, and at long last close the last remaining gap in the Clean Water Act.

This draft is intended to build on the assessments and planning which should have already been done under Sections 208 and 319; and not to impede actions taken since, under Section 319, under the Coastal Zone Act Reauthorization Amendments (CZARA) of 1990, and under the Department of Agriculture's Water Quality Incentive and other conservation programs. For example, a farmer participating in certain USDA programs such as the Water Quality Incentives Program would be considered in compliance with my bill.

The bill rests on shared responsibility: the States and, to the extent possible, local jurisdictions and organizations, would be the main implementors, along with individual land owners/operators. The Federal government, as it does now, would provide direction, guidance, and financial support.

The program is based on watersheds, and targets those which are impaired or threatened.

The bill tracks closely the recommendations of Water Quality 2000. It includes site-level plans, voluntary and enforceable state programs, and reliance on the expertise of USDA and other agencies for technical assistance and funding. It builds on existing Section 319 programs, adopts the management measures developed by EPA and the National Oceanographic and Atmospheric Administration under CZARA as well as the enforceable mechanisms required by that Act; and uses the site-level approach of various Department of Agriculture conservation and water quality programs.

It offers incentives for so-called "good actors," those who have and are implementing approved site-level plans, while preparing a necessary enforcement fall-back for "bad actors" who refuse to clean up.

The bill sets as a goal the full restoration and protection of the nation's waters. This is defined as the attainment and maintenance of water quality standards; the protection and propagation of a balanced, indigenous population of aquatic and aquatic-dependent species, aquatic ecosystem biodiversity, and habitat restoration and maintenance; protection of public

health; restoration and maintenance of recreational activities in and on the water; and protection of underwater sediments through pollution prevention activities.

It requires states to revise their on-going management programs under Section 319, targeting those watersheds which are classified as impaired or threatened under various CWA provisions. States are to prioritize these watersheds, divide them into fifths, and implement Watershed Implementation Programs, starting with a new fifth each year.

The Watershed Implementation Programs would be composed of site-level plans (patterned on USDA's site-level plans for agriculture) developed by land owner/operators along the watershed. The program would borrow heavily on the Soil Conservation Service's technical assistance and experience in working with farmers, to help them develop these plans. EPA would approve the states' revised plans, but not the individual site-level plans.

Implementation would be an iterative process. Four years after implementation, the state would assess the watershed and, if full restoration and protection have not been achieved, would require additional measures, either by owner/operators already implementing plans, or by other sources. This process would be repeated every two years thereafter until full restoration and protection have been achieved. Monitoring in subsequent years would assure that full restoration and protection are maintained.

The bill requires states to develop enforceable mechanisms -- as are already required for coastal states under CZARA. As long as an owner/operator has developed and is implementing a state-approved site-level plan, he or she would not be subject to enforcement.

The bill also ensures that states will participate in the program. Under the point source enforcement program, the National Pollutant Discharge Elimination System (NPDES), EPA can take over and implement a state's permit program if the state no longer meets the requirements of Section 402. However, I did not believe it appropriate for EPA to become involved in implementing site-level plans under a nonpoint program. Therefore, while EPA could under my bill develop a nonpoint source management program for a state, it would not be able to implement this program. Rather, the state not meeting nonpoint requirements would not be able to approve new (as opposed to simple extension of existing) Section 402 permits, or Section 404 permits, either statewide or, if other watersheds are complying, in a single non-complying watershed, until EPA finds the state is meeting requirements.

The bill also establishes a Federal nonpoint source control program, directly under the President, for lands owned or managed by the Federal government.

It requires EPA to establish water quality criteria for those nonpoint pollutants for which such criteria have not yet been set.

It codifies existing Federal antidegradation policy.

It contains provisions to assure that new sources of nonpoint source pollutants are identified prior to any action being taken, and that state-of-the-art controls are used on these new sources before they cause pollution.

And, finally, the bill creates a Citizen Watershed Monitoring Program to assist states in monitoring their waters. The states would by contract, cooperative agreement or other means develop citizen programs, provide training, and implement quality control and assurance measures to make sure that the data gathered by citizens are useful to the state. The nonpoint and other amendments to the CWA will put heavy monitoring burdens on states, and I believe a citizen program, properly designed and run, can assist states in this effort.

Finally, comes the crucial element of funding for this program. I have tentatively proposed \$100 million per year from the State Revolving Fund. I would welcome other suggestions, both on the adequate level, and the source, since loans are not always as easily made to individual land owners/operators as to municipalities. Hopefully, the Soil Conservation Service will remain a major source of assistance for farmers implementing site-level plans under the Water Quality Incentives and other USDA programs as well as this one.

Also, the States will need adequate administrative funding for this and the other new tasks that will be imposed upon them under the new legislation. I fully sympathize with the complaints of the states as to ever-increasing federal mandates with no concomitant increase in federal funds.

I know that this Committee will face many competing demands for funding as you develop the bill; but since nonpoint sources are the major cause of water pollution, I would hope that this program would receive a share of control and prevention funding commensurate with the task.

Mr. Chairman, I believe that this bill is fair and necessary, if America is to achieve the goal of clean water. We have several choices. We can continue to charge taxpayers and industry for ever-more-costly wastewater treatment and for maintenance of navigation on silt-choked rivers. We can continue to inflict losses on commercial fishing and shellfishing, and deny water recreational opportunities to our people. Or, we can finally consummate the goal of the 1972 Act, and close the last remaining gap in that Act's ability to protect America's waters.

I would add that the bill is a discussion draft. It has been very widely distributed, and I have begun to receive comment on it. I hope to have the bulk of the comments by the end of this month, then to review them and incorporate as much as possible in a revised version.

Ultimately, of course, I hope my Nonpoint Source Pollution Prevention Act can be included in the Clean Water Act Amendments you will be writing later this year. I will be happy to work with you and your staff on this, and look forward to doing so.

Mr. APPLEGATE. The subcommittee now stands in recess until 9:30, tommorrow. At that time we will hear from various environmental organizations as well as agricultural interests.

[Whereupon, at 12:33 p.m., the subcommittee was recessed.]

PREPARED STATEMENTS SUBMITTED FOR THE RECORD  
TESTIMONY OF

CONGRESSMEN GARY ACKERMAN (NY-5) AND CHRISTOPHER SHAYS (CT-4)

H.R. 1035, LONG ISLAND SOUND RESTORATION ACT OF 1993

WATER RESOURCES SUBCOMMITTEE

April 21, 1993

Mr. Chairman and members of the House Public Works and Transportation Subcommittee on Water Resources:

Thank you for giving us the opportunity to come before your subcommittee. As members of the Long Island Sound Caucus, we are here today to discuss an issue of great significance to our constituents and, we believe, to our nation -- the potential destruction of this precious estuary, Long Island Sound. We are also here to discuss what the federal role can be, given our limited resources.

More than 14.5 million people live within the Sound's drainage basin. This statistic is important because it shows the Sound is enjoyed by millions as a source of recreation, aesthetic beauty and livelihood.

It also highlights the tremendous burdens on this estuary as a result of exceptionally high population density, which makes the Sound a unique challenge in terms of addressing its pollution problems.

Our waterways have seen great improvement due to the federal commitment and the efforts of this subcommittee. But we feel the federal government must play a greater role in providing direct assistance for sewage treatment plant upgrades given the magnitude of the problems throughout the nation, and particularly in New York City.

The members of the Long Island Sound Caucus are pleased to see a Congress and an Administration committed to preserving our nation's environmental quality. The President's initial stimulus package called for injecting more than \$800 million to refinance the State Revolving Fund (SRF) program. This is a recognition not just of the importance of cleaning up our nation's waterways, but that the work involved is of substantial economic benefit to the nation in both the short and long term.

Study of the Sound began in 1985 by the Environmental Protection Agency (EPA), and the States of Connecticut and New York. In 1988, Long Island Sound was designated an "estuary of national significance" and as such the EPA, the States of Connecticut and New York formed a management conference to formulate a Comprehensive Conservation and Management Plan (CCMP). After seven years and \$12 million, the draft CCMP was released last November. The CCMP identified areas that need special attention, including the most pressing problem, low dissolved oxygen or "hypoxia," caused primarily by nitrogen emissions by sewage treatment plants.

In 1994, the hydrodynamic model, currently being constructed, will be ready to identify the sources of nitrogen and other pollution so we know where to focus our limited resources to have greatest impact on the overall health of the Sound.

The draft CCMP for Long Island Sound estimates that controlling nitrogen loadings into Long Island Sound could cost as much as \$8 billion. If all recommendations of the CCMP were to be implemented, the total sewage treatment plant need is estimated to be approximately \$25 billion in New York, and \$3.5 billion in Connecticut. Both states are currently straining to find the resources to accomplish all that needs to be done.

We are painfully aware the federal budget deficit is making it difficult to address all pressing needs. It is our hope over the next several years we will make headway in getting our financial house in order. It is only then we will have adequate funds to address our water quality needs.

In the meantime, it is important we establish some pilot programs with innovative technologies so we will know what works when more money is available. These technologies can help further efforts to develop cost effective, less expensive ways to improve water quality.

The state of Connecticut, for example, created a program to enable coastal municipalities, which have plants with excess sewage treatment capacity, to remove nutrients without going to tertiary treatment.

The Stamford Sewage Treatment facility is employing a process called nitrification and denitrification. It is successfully removing at least 70 percent of the nitrogen without making any physical changes to the plant. Since the Stamford plant has excess capacity, the costs required for this process entails only \$10,000 more in higher electrical costs. Of course, this is not the situation in all of our plants, as you well know.

Another example is the Tallman Island Plant in Queens, New York, which is experimenting with aeration methods and has been successful in enhancing its nitrogen removal capability.

The bottom line is, with secondary plus treatment, we may be able to do much more than we are now doing and at a minimal cost.

Our proposal is the product of meetings with scientists, environmentalists and state and city officials in New York and Connecticut in an effort to come up with a demonstration program, which can serve as a model for estuary conservation throughout the country.

H.R. 1035 authorizes the federal government to spend \$250 million over five years, with a 70 percent federal, 25 percent state and five percent local match. Because state and local communities will directly benefit from this demonstration program, we feel it is important to have some state and local matching requirements.

This demonstration program would target six candidate harbors or bays for remediation. Our goal would be to significantly rejuvenate these harbors within five years. The six harbors would serve as "laboratories" in which to test innovative clean up technologies. It is our hope that through trial and error, we will see in these harbors what works and what does not.

Under our demonstration program, we would target harbors where the beaches are widely enjoyed by swimmers and where sport fishing, boating and shellfishing are integral parts of the life of the community. Another important part of the selection criteria would be -- what can we learn from these candidate harbors?

In conjunction with the Long Island Sound Status Report and Interim Actions for Hypoxia's call for immediate action to address the problem of hypoxia, these candidate harbors could be designated as "no net discharge zones" for nitrogen.

They would serve as model clean up areas. Improvements could involve both point source and non-point source remediation. It would be up to the states to develop a specific management plan for each candidate harbor.

With regard to point source pollution, although we hope the state revolving loan program will provide sufficient funding for point sources, our program would encourage the implementation of innovative technologies for nitrogen removal.

We also would like to see additional training for sewage treatment plant operators to facilitate effective troubleshooting and to reduce operational errors. There is also a need for greater attention to operation and maintenance programs to reduce the number of mechanical problems at some of our aging plants.

With regard to nonpoint sources, in these candidate harbors, we would encourage wetland protection, restoration and construction. We would also encourage greater use of buffer strips, stricter land-use protections and the placement of sediment and runoff basins. Boats could be required to employ marine sanitation devices. Efforts also should be made to address problems with aging septic systems.

The states would work in conjunction with the Long Island Sound Management Committee (under the Long Island Sound Study) to develop a competitive selection process. They also would decide what combination of improvements should be implemented in each of the harbors.

In assessing the programs's success, we will look to actual signs of improved water quality. There will have to be visible and tangible improvements in recreational uses and marine life and obviously, the water would have to be cleaner. In other words, we would judge success on whether the public could now "do" or "see" what they could not "do" or "see" a few years before.

If we see rejuvenation in these candidate harbors, we feel this demonstration program could be expanded on a larger scale, not only throughout Long Island Sound, but in other estuaries as well. We could, of course, increase our goals with additional funding, but are very cognizant of budget restraints.

This plan will also have tremendous economic benefits for the Long Island Sound region. An estimated 12,000 construction jobs, and 28,000 to 32,000 support jobs, will be created by this effort. Added to this is the benefit to commercial fishing and waterfront recreation, which is still a billion dollar industry despite the erosion of water quality we have seen.

Mr. Chairman, we hope you and your subcommittee will look favorably on our proposal and consider it for inclusion in the reauthorization of the Clean Water Act. Thank you for giving us the opportunity to testify.

103D CONGRESS  
1ST SESSION

# H. R. 1035

To authorize the Administrator of the Environmental Protection Agency to make grants to the States of New York and Connecticut for the purpose of demonstrating methods of improving water quality in Long Island Sound.

---

## IN THE HOUSE OF REPRESENTATIVES

FEBRUARY 23, 1993

Mr. ACKERMAN (for himself, Mr. SHAYS, Mr. HOCHBRUECKNER, Mr. GEJDE-ENSON, Mrs. LOWEY, Mr. ENGEL, Ms. DELAURO, Mrs. KENNELLY, Mr. KING, Mr. MANTON, Mr. SCHUMER, Mr. TOWNS) introduced the following bill; which was referred jointly to the Committees on Public Works and Transportation and Merchant Marine and Fisheries

---

## A BILL

To authorize the Administrator of the Environmental Protection Agency to make grants to the States of New York and Connecticut for the purpose of demonstrating methods of improving water quality in Long Island Sound.

1 *Be it enacted by the Senate and House of Representa-*  
2 *tives of the United States of America in Congress assembled,*

3 **SECTION 1. SHORT TITLE.**

4 This Act may be cited as the "Long Island Sound  
5 Restoration Act".

## 2

1 **SEC. 2. LONG ISLAND SOUND DEMONSTRATION PROGRAM.**

2 (a) **IN GENERAL.**—The Administrator shall carry out  
3 a demonstration program under which the Administrator  
4 may make grants on an annual basis to the States of New  
5 York and Connecticut in accordance with this section.

6 (b) **PURPOSES.**—The Administrator shall carry out  
7 the program under subsection (a)—

8 (1) to demonstrate methods of restoring and  
9 maintaining the water quality of designated bays  
10 and harbors of Long Island Sound at which water  
11 quality standards adopted pursuant to section 303  
12 of the Federal Water Pollution Control Act have not  
13 been achieved or at which other significant water  
14 quality degradation has occurred;

15 (2) to demonstrate the importance of control-  
16 ling nonpoint sources of pollution in restoring and  
17 maintaining water quality;

18 (3) to enhance opportunities for water-depend-  
19 ent recreational activities, maintain a healthy eco-  
20 system, protect and enhance marine life, minimize  
21 health risks associated with human consumption of  
22 shellfish and finfish, and ensure that social and eco-  
23 nomic benefits to the general public associated with  
24 Long Island Sound are advanced; and

25 (4) to advance goals and recommendations con-  
26 tained in the Comprehensive Conservation and Man-

## 3

1       agement Plan of the Long Island Sound Study de-  
2       veloped pursuant to section 320 of the Federal  
3       Water Pollution Control Act.

4       (c) DESIGNATION OF BAYS AND HARBORS.—

5             (1) IN GENERAL.—In order to be eligible to re-  
6       ceive grants under subsection (a), the States of New  
7       York and Connecticut shall each designate in accord-  
8       ance with paragraphs (2) and (3) bays and harbors  
9       of Long Island Sound at which the State plans to  
10      carry out eligible activities with amounts of such  
11      grants and transmit such designations to the Admin-  
12      istrator.

13            (2) DESIGNATIONS BY STATE OF NEW YORK.—  
14      The State of New York shall designate pursuant to  
15      paragraph (1) one bay or harbor in each of the fol-  
16      lowing 4 political subdivisions of the State of New  
17      York: Westchester County, Nassau County, Suffolk  
18      County, and New York City.

19            (3) DESIGNATIONS BY STATE OF CONNECTI-  
20      CUT.—The State of Connecticut shall designate pur-  
21      suant to paragraph (1) one bay or harbor in 2 of the  
22      following 4 political subdivisions of the State of Con-  
23      necticut: Fairfield County, New Haven County, Mid-  
24      dlesex County, and New London County.

1           (4) PARTICIPATION OF MANAGEMENT COMMIT-  
2     TEE.—The States of New York and Connecticut  
3     shall each make designations pursuant to paragraph  
4     (1) in cooperation with the Management Committee  
5     of the Long Island Sound Study established pursu-  
6     ant to section 320 of the Federal Water Pollution  
7     Control Act.

8           (5) PARTICIPATION OF NEW YORK CITY.—The  
9     State of New York shall designate a bay or harbor  
10    in New York City pursuant to paragraph (1) in co-  
11    operation with the Mayor of New York City (or the  
12    designee of the Mayor).

13          (d) TERMS AND CONDITIONS.—The Administrator  
14    may make a grant to a State under subsection (a) only  
15    if the State enters into an agreement with the Adminis-  
16    trator which contains the following terms and conditions  
17    for receipt of the grant:

18           (1) USE OF GRANT.—Except as provided in  
19    paragraph (3), all amounts of the grant shall be  
20    used by the State—

21           (A) to carry out eligible activities and a  
22    monitoring program pursuant to paragraph (4)  
23    at bays and harbors designated by the State  
24    pursuant to subsection (c); and

## 5

1 (B) to educate the public, in coordination  
2 with the office established pursuant to section  
3 119 of the Federal Water Pollution Control  
4 Act, on the implementation and results of such  
5 eligible activities.

6 (2) DISTRIBUTION OF GRANTS AMOUNTS.—  
7 Equal amounts of the grant shall be used by the  
8 State for conducting eligible activities at each bay  
9 and harbor designated pursuant to subsection (c).

10 (3) ADMINISTRATIVE EXPENSES.—Not to ex-  
11 ceed 1.5 percent of the amount of the grant may be  
12 used by the State for staff salaries and other admin-  
13 istrative expenses incurred by the State in carrying  
14 out activities with the grant.

15 (4) MONITORING.—The State shall design and  
16 carry out a program for monitoring water quality at  
17 bays and harbors designated pursuant to paragraph  
18 (c) in order to determine the effectiveness of eligible  
19 activities being conducted by the State using  
20 amounts of the grant. Activities under such program  
21 shall be reviewed and evaluated by the Long Island  
22 Sound Study Scientific and Technical Advisory Com-  
23 mittee and by the Long Island Sound Monitoring  
24 Work Group.

## 6

1           (5) REPORTING.—The State shall comply with  
2 reporting requirements contained in subsection (f).

3           (e) DISTRIBUTION OF GRANTS.—The Administrator  
4 shall use  $\frac{2}{3}$  of the amounts appropriated in a fiscal year  
5 to carry out this Act for making grants to the State of  
6 New York under subsection (a) and  $\frac{1}{3}$  of such amounts  
7 for making grants to the State of Connecticut under sub-  
8 section (a).

9           (f) REPORTS.—

10           (1) REPORTS TO THE ADMINISTRATOR.—A  
11 State receiving a grant under subsection (a) shall  
12 transmit to the Administrator, not later than 18  
13 months after the date of receipt of the grant and bi-  
14 ennially thereafter for the term of the program  
15 under subsection (a), a report on eligible activities  
16 carried out by the State using amounts of the grant  
17 and on the results of the monitoring program car-  
18 ried out by the State pursuant to subsection (d)(4),  
19 including a summary of evaluations conducted pur-  
20 suant to subsection (d)(4). Any such report may be  
21 transmitted as part of a report submitted by the  
22 State pursuant to section 320(h) of the Federal  
23 Water Pollution Control Act.

24           (2) REPORT TO CONGRESS.—On or before the  
25 last day of the 5th fiscal year beginning after the

1 date of the enactment of this Act, the Administrator  
2 shall transmit to Congress a report on the results of  
3 the program conducted under subsection (a), to-  
4 gether with an analysis on the extent to which the  
5 purposes described in subsection (b)(3) have been  
6 realized and recommendations for appropriate ad-  
7 ministrative and legislative actions.

8 (g) NON-FEDERAL SHARE.—The non-Federal share  
9 of the cost of activities carried out with amounts from  
10 grants under subsection (a) in a fiscal year shall be 30  
11 percent. One-sixth of such non-Federal share shall be pro-  
12 vided by sources in the locality in which such activities  
13 are carried out.

14 (h) DEFINITIONS.—For the purposes of this Act, the  
15 following definitions apply:

16 (1) ADMINISTRATOR.—The term “Adminis-  
17 trator” means the Administrator of the Environ-  
18 mental Protection Agency.

19 (2) ELIGIBLE ACTIVITY.—The term “eligible  
20 activity” means an activity conducted for the pur-  
21 pose of addressing one or more of the following  
22 problems:

23 (A) POLLUTANTS FROM NONPOINT  
24 SOURCES.—Urban and suburban runoff of pol-  
25 lutants into Long Island Sound from forestry,

1 agriculture, and other land uses. Such pollut-  
2 ants include sediments associated with logging,  
3 pesticides, fertilizers, animal waste, litter, over-  
4 flows from failing septic systems, leaching of  
5 contaminants from landfills, and discharges  
6 from coastal development and construction  
7 sites.

8 (B) WASTE FROM RECREATIONAL  
9 BOATS.—The discharge of waste into Long Is-  
10 land Sound from recreational boats and the  
11 leaching of antifouling paints.

12 (C) POLLUTANTS CARRIED BY RIVERS.—  
13 Pollutants which are carried by rivers into Long  
14 Island Sound.

15 (D) AIRBORNE POLLUTANTS.—Airborne  
16 pollutants which are emitted and attached to or  
17 absorbed by moisture and particles in the envi-  
18 ronment and which enter Long Island Sound.

19 (E) WETLANDS DEGRADATION.—The dete-  
20 rioration of tidal wetlands of Long Island  
21 Sound from their natural state and the adverse  
22 effects of such deterioration on near-shore habi-  
23 tat.

24 (F) POLLUTANTS FROM POINT SOURCES.—  
25 Pollutants discharged into Long Island Sound

1           from a discharge pipe, sewage treatment plant,  
2           or industrial facility.

3           (i) AUTHORIZATION OF APPROPRIATIONS.—There is  
4 authorized to be appropriated to carry out this Act  
5 \$50,000,000 per fiscal year for each of the first 5 fiscal  
6 years beginning after the date of the enactment of this  
7 Act.

Congressman Benjamin L. Cardin

Testimony before the Subcommittee on  
Water Resources and Environment  
April 21, 1993

Mr. Chairman, I greatly appreciate the opportunity to appear before your Subcommittee. As a former member of the Water Resources panel, it is always nice to be back. This year though, you face a real challenge in shaping a comprehensive reauthorization of the Clean Water Act. This legislation has accomplished much over the years, but also found its share of controversy.

I am here seeking support for continuing and building upon one of the real success stories of the Clean Water Act -- the Chesapeake Bay Program. Begun over 10 years ago, with the signing of the original Chesapeake Bay Agreement by the EPA Administrator, the Governors of Maryland, Virginia, and Pennsylvania, the District of Columbia Mayor, and the tri-State Chesapeake Bay Commission Chairman, the Bay Program has grown into an international model for regional, intergovernmental cooperation in long-term environmental restoration and protection.

Later today, I, along with many of my colleagues from throughout the region, will be introducing the Chesapeake Bay Restoration Act of 1993. Rarely is a piece of legislation so broadly and deeply supported. This bill has the support of every imaginable group interested in the Bay --- each of the regional states and DC, industry groups, and a wide array of environmental and citizens groups. There is perhaps no other issue that so unites the people of the Mid-Atlantic states as the clean-up of the Chesapeake. It is our hope that this Subcommittee will include language to continue and improve the Chesapeake Bay Program in the new Clean Water Act, as has happened in the past.

This year's bill seeks to better coordinate the many federal activities and responsibilities related to the Bay. Organizing varying federal agencies' efforts in the clean-up has become increasingly important. Today, 9 federal agencies have formal Memorandums of Understanding with the EPA's Bay Office, and others manage large tracts of land or major facilities within the watershed.

In addition, a number of ongoing federal activities related to the Bay clean-up would be directly unified under this authorization. While this makes sense by further improving coordination and implementation, additional current spending would be shown in the new authorization total. So although this bill calls for a \$23 million authorization in FY 94, growing to \$28 million in 1999, these are not significant increases over current federal outlays for the varying programs we are trying to bring together. In FY 93, \$19 million was appropriated for the narrowly-defined EPA Bay Office activities alone.

I have included a section-by-section analysis of the bill for your review with my testimony. I would like to highlight a few points:

- o One of the offshoot programs begun in recent years that we are now trying to bring under the Bay Program "umbrella" is a toxics reduction strategy. This effort had its genesis in a Baltimore field hearing held by this Subcommittee in March 1988 to consider toxic pollution in the Chesapeake. This legislation authorizes the EPA to collect data and assist the states in implementing specific actions to reduce toxics use and risks.

- o A second, ongoing effort being unified into the Bay Program is habitat restoration and enhancement. More is known about the Bay ecosystem than perhaps any other major estuary in the world; this foundation provides the best means for testing and evaluating national demonstrations of wetlands development, shoreline forest buffers, or other protections. As coordinator of these studies, the EPA will also ensure that knowledge of the most valuable techniques identified is widely distributed.

- o The EPA continues as the lead Bay Program agency, while a Chesapeake Bay Federal Agencies Committee is established with representatives from 16 federal agencies. Federal facilities and activities within the Bay watershed are required to be consistent with the goals of the Bay Program. And,

- o Given that this is the 10th anniversary of the Program, the bill also directs the EPA to undertake a comprehensive assessment of the entire intergovernmental effort.

The federal role in the Chesapeake Bay Program has been the "glue" holding the federal, state, and local governments' activities together in the long-term battle to reverse the Bay's decline. There are signs of improvement and many small victories:

- o Phosphorus discharges into the Bay, a key component in the nutrient loading problem, have declined by 35% from 1985 levels; in large part due to a ban on phosphates in detergents and the construction of new sewage treatment facilities.

- o Submerged Aquatic Vegetation (SAV), critical habitat for many Bay species, has been making a slow, but steady comeback in the estuary's shallow waters; due to overall improvements in water quality. And,

- o Striped Bass populations in the Bay are up from dangerously low levels in the early 1980s; based on successful management controls.

But the toughest challenges lay ahead and threats to this nation's most productive estuary remain very real -- nutrient loads of nitrogen have increased about 5% since 1985; many key species, including oysters, shad, and white perch, continue to decline; toxics concentrate in the Bay's sediments and waters; and most importantly, population pressures in the Bay's watershed are increasing. The region's population grew 40% in the last 20 years, and whether by runoff from newly planted lawns or air pollution from additional automobiles, that pace threatens to overwhelm restoration efforts.

Though many challenges remain, the EPA Chesapeake Bay Program is a great success and a model for many similar regional efforts. As you shape a Clean Water reauthorization, I would ask you to continue and strengthen our worthy efforts to "Save the Bay". Thank you for your time and attention. I would be happy to answer any questions.

CHESAPEAKE BAY RESTORATION ACT OF 1993  
SECTION-BY-SECTION ANALYSIS

Section 1. SHORT TITLE:

Establishes the title of the bill, the "Chesapeake Bay Restoration Act of 1993."

Section 2. FINDINGS and PURPOSE:

States that the purpose of the Act is to expand and strengthen the cooperative efforts to restore and protect the Chesapeake Bay and to achieve the goals embodied in the Chesapeake Bay Agreement.

Section 3. DEFINITIONS.

Defines the terms, "Administrator," "Chesapeake Bay Agreement," "Chesapeake Bay Program," "Chesapeake Bay Watershed," "Chesapeake Executive Council," and "Person."

Section 4. MANAGEMENT OF CHESAPEAKE BAY PROGRAM:

Provides authority for EPA to continue to lead and coordinate Federal agency participation in the Chesapeake Bay Program, in cooperation with the Chesapeake Executive Council, and to maintain a Chesapeake Bay Liaison Office.

Directs the Chesapeake Bay Liaison Office to provide support and coordinate Federal, state and local efforts in developing strategies and action plans and conducting system-wide monitoring and assessment to improve the water quality and living resources of the Bay.

Establishes a "Chesapeake Bay Federal Agencies Committee" to facilitate collaboration, cooperation and coordination among the agencies and programs of the Federal government in support of the restoration of Chesapeake Bay.

Directs each agency to provide, as part of its annual budget submission to the Congress, a report on the activities being undertaken and planned and the resources being provided to assist in the Bay restoration effort.

Section 5. FEDERAL FACILITIES COMPLIANCE:

Requires each department, agency or instrumentality of the United States which owns or operates facilities within the Bay watershed to perform an annual assessment of their facilities to ensure consistency and compliance with the commitments, goals and objectives of the Bay program. Also requires the agencies to develop a detailed plan, funding mechanism and schedule for addressing or mitigating any potential impacts.

Section 6. CHESAPEAKE BAY WATERSHED, TRIBUTARY AND RIVER BASIN PROGRAM:

Authorizes a comprehensive research, monitoring and data collection program to assess the status and trends in the environmental quality and living resources of the major tributaries, rivers and streams within the Chesapeake Bay watershed and to assist in the development of management plans for such waters. Directs the establishment of a system for accounting for sources of nutrients, and the movements of nutrients, pollutants and sediments through the watershed.

Provides for development of a coordinated Chesapeake Bay watershed land use data base, incorporating resource inventories and analyses in a digital format, to provide information necessary to plan for and manage growth and development and associated impacts on the Bay system.

Encourages local and private sector participation in efforts to protect and restore the rivers and streams in the Bay watershed by establishing a technical assistance and small grants program. Requires that local efforts be coordinated in a watershed-wide strategy.

Section 7. HABITAT RESTORATION AND ENHANCEMENT DEMONSTRATION PROGRAM:

Establishes a habitat restoration and enhancement demonstration program to develop, demonstrate and showcase various low-cost techniques for restoring or enhancing wetlands, forest riparian zones and other types of habitat associated with the Chesapeake Bay and its tributaries.

Directs the Administrator, in cooperation with the Chesapeake Executive Council, to develop a plan for the protection and conservation of wetlands, contiguous riparian forests and other habitats within the Bay watershed, within two years from the date of enactment of the act.

Establishes a central clearinghouse to facilitate access to information about Bay watershed habitat locations, types, acreages, status and trends and restoration and design techniques.

Directs the Administrator to publish and disseminate on a periodic basis a habitat protection and restoration guidance manual describing methods, procedures and processes to guide State and local efforts in the protection and restoration of various types of habitat.

**Section 8. BASIN WIDE TOXICS REDUCTION.**

Authorizes EPA to assist the States in the implementation of specific actions to reduce toxics use and risks throughout the Bay watershed. Directs the Administrator to assist the States in improving data collection on the sources of toxic pollutants entering the Bay and integrating this information into the Chesapeake Bay Program Toxics Loading Inventory. Also directs the Administrator to begin implementing toxics reduction, pollution prevention and management actions, including targeted demonstration projects, to achieve the toxics reduction goals of the Bay Agreement.

**Section 9. STUDY OF CHESAPEAKE BAY PROTECTION PROGRAM.**

Directs EPA to undertake an assessment of the Chesapeake Bay Program and evaluate implementation of the Bay Agreement. Also directs EPA to assess priority needs for the Bay and make recommendations for improved management of the program.

**Section 10. AUTHORIZATIONS.**

Authorizes \$23 million for fiscal year 1994, \$24 million for fiscal year 1995, \$25 million for fiscal year 1996, \$26 million for fiscal year 1997, \$27 million for fiscal year 1998 and \$28 million for fiscal year 1999 to carry out this act.

**Testimony by Representative Peter Deutsch before the  
Public Works Subcommittee on Water Resources and Environment**

April 21, 1993

Over the last ten years, the water pollution in and around the Florida Keys has become a cause of great concern. Water quality is a critical issue for anyone who cares about fishing, diving, and the hundreds of businesses they support. This is an economic reality for the constituents of my district in Monroe County - not just an academic or scientific problem.

There is a strong consensus that water pollution, regardless of its source, is the number one problem threatening the health of our coral reefs, fisheries, and marine resources. This consensus has existed since at least 1988.

Scientists will always debate various aspects of a research problem. That debate, an integral and essential part of science, is raging now between the groups trying to assess the relative importance of the different water quality threats, such as local sewage sources, the Everglades or global climate change. But too much debate will cost the Florida Keys its fisheries and ultimately, its tourist-based economy. In addition, it could cost all of us the only living coral reef in North America.

Florida Bay:

Historically, Florida Bay was an estuary; a place where

seawater was measurably diluted by freshwater. The freshwater flowing into Florida Bay came from the Everglades.

Estuaries are highly diverse and productive ecosystems. Well known estuaries like the Chesapeake Bay and Apalachicola Bay support famous fisheries of blue crabs and oysters. Florida Bay is no different:

- Every pink shrimp caught at the Dry Tortugas, one of Florida's most valuable fisheries, spends at least part of its life in the seagrass beds of Florida Bay.
- Florida Bay used to teem with redfish, tarpon, bonefish, mullet and seatrout.
- Florida Bay used to support huge breeding colonies of roseate spoonbills and other wading birds, all feeding on the crustaceans and fish grow there.

Florida Bay is no longer an estuary. Since 1910, the growing demands of the agricultural industry and urban areas to drain wetlands, divert flows and provide water supplies have progressively cut off the freshwater that flowed into Florida Bay. The result is that more than two-thirds of the freshwater has been diverted, starving the Bay. Because Florida Bay is very shallow and has restricted circulation (it is sandwiched between the mainland and the Keys) natural evaporation concentrates the salt in the water. Today we routinely measure salt concentrations double those of normal seawater: Florida Bay is now a hypersaline lagoon.

This is the fundamental fact: two-thirds of the Bay's freshwater supply has been cut. Not surprisingly, the ecology of

the Bay has been radically altered in ways that can only be characterized as catastrophic: Fisheries have declined and wading bird populations have crashed. The pink shrimp catch at the Dry Tortugas has dropped 60% during the 1980's.

Research and debate must continue over what is happening in Florida Bay, but a fundamental fact cannot be denied:

Two thirds of the freshwater that used to flow into Florida Bay has been cut off and the Bay has been converted from a highly productive estuary to a hypersaline lagoon.

The obvious solution to this problem is to restore freshwater flows into the Bay. Whatever else is happening in the Bay, it won't return to its former productivity as an estuary without freshwater.

#### Florida Bay - Coral Reef Connection

There is now evidence that the problems in Florida Bay may be linked to the decline of the Keys' coral reefs, a decline that has been obvious for years. Water flows from Florida Bay and the Gulf of Mexico through the channels of the Keys, to Hawk Channel and the Straits of Florida. This flow transports Gulf water to the ocean side all year long.

In recent years, a strange phenomenon has occurred to divers on the reefs: the surface water is cool, but there is a layer of warm water on the bottom. Elementary physics states that hot water is less dense than cold water and thus the warm water should be floating on the surface. If the warm water layer is underneath the cool water, it must be more dense.

In the summer of 1992, researchers confirmed what scientists had suspected. Hot, supersalty water from Florida Bay was measured flowing through the Key's channels and sinking under the cooler water in Hawk Channel. This hot, supersalty water then hugged the seabottom and was detected at the coral reefs in the Middle Keys.

If more research confirms that hot, supersalty water from Florida Bay regularly reaches the coral reefs, then we will undoubtedly know that it is a significant factor in the decline of the living corals because corals have limited tolerance for hot water and high salinity. Thus, the alterations that have been made in the Everglades are not only killing the Glades and Florida Bay but also contributing to the destruction of the reefs.

#### Need for Ecosystem Wide Approach

Understanding that the problems in Florida Bay involve an entire ecosystem that stretches from Lake Okechobee to the coral reefs of the Florida Keys is the first step towards finding a solution that does not look strictly at Florida Bay. An ecosystem wide approach will require the participation of all of the Federal and State agencies that have jurisdiction over the various parts of the system.

Section 3 of the Save Florida Bay Bill (H.R. 1564) calls for the establishment of an Interagency Committee made up of representatives from the Department of the Interior, EPA, U.S. Army Corps and National Marine Fisheries to develop a program for Florida Bay restoration. I believe this idea needs to be

expanded. The emergency nature of the problem requires the creation of a high level Interagency Task Force that is charged with the responsibility of developing a plan of action not only for Florida Bay but for the entire system including also the Everglades and the coral reefs.

As the Congressional Representative for Monroe County, I wish to emphasize to the members of this Committee the critical situation that the residents of the Florida Keys are now facing. The economy of the Keys depends on good water quality. The people of Monroe County are now seeing the results of what the lack of fresh water has done to Florida Bay - tens of thousands of acres of dead seagrass and a monstrous algae bloom 100 square miles in diameter and growing, flowing through the bridges connecting the keys and out to the reef tract. They are frightened. There is an unprecedented unanimity among all groups from commercial fisherman, to Chambers of Commerce, to local environmental organizations. Decisive action by the Federal government is needed immediately.

It is time for all of the Federal Agencies involved in this problem to be given the Congressional mandate to take action. Up until now each agency has been dealing with only that small part of the puzzle over which they claim jurisdiction. An interagency task force must come to grips with this problem of jurisdictional lines between agencies and provide the leadership necessary to coordinate corrective actions. It is time to stop abdicating responsibility and get on with the job at hand.

Congressman Don Edwards of California  
Testimony on the Clean Water Act and Wetlands  
Public Works Subcommittee on Water Resources  
April 21, 1993

Thank you for giving me the opportunity to testify today. I would like to commend the Committee for beginning the process of reauthorizing the Clean Water Act by holding these hearings.

The reauthorization of the Clean Water Act presents us with the opportunity to reform the nation's policy on wetlands. Over the past few years, the debate over wetlands and how they should be treated has become polarized in various ways. The issue has been described in terms of jobs vs. the environment, private property rights vs. conservation, or developers vs. environmentalists, implying that one group's gain is another's loss.

It is actually more simple than that; if we continue to destroy our wetlands, then every one of us will lose. We must move past these narrow descriptions of the issue if we are to successfully arrive at a national wetlands policy that is both economically and environmentally sound.

We all understand why it is important to save wetlands. They act as flood control buffers, purify and replenish our water supplies, and control erosion. They are ecological gold mines, producing and sustaining as many life forms and organic materials as rainforests.

So many of the benefits wetlands provide are hard to quantify in traditional economic terms, and this has contributed to their decline. We must recognize that wetlands have socio-economic value in their natural state, and not only in the context of their potential development value. I am encouraged by signs that this concept is becoming more widely understood.

For example, the small and financially strapped community of Carpinteria, California rejected a lucrative offer from developers to build a marina and condominiums on beachfront property and nearby wetlands. Instead, the community will spend \$1.3 million to purchase wetlands in the Carpinteria Salt Marsh to allow for their preservation, so that the long-term social and economic benefits they offer will never be lost.

Because most of the benefits of wetlands are now well-known, everyone agrees that they must be preserved. However, once we move into the arena of how much and which wetlands should be saved, consensus disappears. I believe that for a policy to be fair and effective it must be clear and consistent. It should expand and strengthen the protections to reduce the rate of wetland losses; it must give consideration to the special needs of farmers and small landowners; and it should offer incentives to encourage the protection of privately held wetlands.

Congressman Don Edwards

Page 2

I believe that each of these areas are effectively addressed in H.R. 350, the Wetlands Reform Act, which I introduced early this year. This bill should serve as a blueprint for the nation's wetlands policy because it does the following:

- It amends the Clean Water Act to explicitly include a provision covering the protection of wetlands.
- It expands the number of activities that are covered under the Act to all that are harmful to wetlands, including drainage, ditching and the clearing of vegetation.
- Because no small landowner should have to wait several months for a permit application to be processed, H.R. 350 would establish a "Fast Track Team" to process applications dealing with wetlands of one acre or less within a 60 day period.
- It protects farmers by maintaining the laws that allow special exemptions for agricultural uses of wetlands. It further clarifies that artificial wetlands and abandoned cropland will remain free from regulation.
- It uses the carrot, rather than the stick, approach to encourage private holders of wetlands to preserve their land as wetlands. This is achieved through tax incentives to encourage landowners to donate their property to trusts or limit activities on their land to those that are compatible with wetlands.

We must not be seduced by simplistic approaches to dealing with the complex issue of wetlands. I understand that there is support for a national classification system to divide all wetlands into categories according to their value. In theory, this appears to be a very helpful system, but implementing such a ranking system is full of problems. Determining what functions are of high value and which are low must be based on very subjective criteria. For example, bottomland hardwood swamps are very important for storing floodwaters, and this clearly has value. But is it more important to preserve a swamp than a marine wetland that supports a number of endangered plant and animal species? I fear that high value classifications will tend to be given only to wetlands with low real estate values.

I find it disconcerting that many complaints are raised against giving equal protection to wetlands that are not very wet. There is no good reason to link the value of a wetland to its degree of wetness. First of all, many wetland areas have become degraded because they have been cut off from their natural water supply. In my home state of California, we just emerged from six years of drought that left many wetlands dry for long periods of time, but

Congressman Don Edwards  
Page 3

which are now once again holding water and teeming with wildlife.

Many wetlands that are often devoid of standing water are more effective at providing flood control protection. Or in some cases, as with seasonal wetlands, standing water is only present during a limited, but critical, period of time. For instance, prairie potholes provide millions of migrating birds with nesting, feeding and resting areas. In fact, the most shallow and seemingly insignificant of these are often the most critical to the survival of migrating and nesting waterfowl. Because they thaw quickly in the spring and are the first to support the microorganisms that provide fuel for waterfowl, destroying them reduces the survival rate of many of these birds.

Another good example of a program that appears to offer an easy solution to ending the loss of wetlands is mitigation banking. When the policy emerged in 1978, it appeared to offer a means for making up for wetland losses caused by development, so that unlimited development and our wetlands base could be sustained at the same time.

Federal and state studies have shown that efforts to restore or create wetlands have had mixed results at best, largely because we lack the scientific expertise needed to replicate the fragile ecological balance of wetlands. In addition, replacement wetlands are often unsatisfactory because they rarely perform as many or even the same functions as the natural wetlands they replace.

I believe that mitigation, carefully applied, has the potential to help bring about some net gains in our wetlands base, and merits further exploration. My bill, H.R. 350 includes a provision calling for a wetlands restoration pilot program to help us learn more about this subject. But I do not believe that mitigation should ever be used to help free up existing wetlands for uncontrolled development.

I also have serious reservations over broadening the application of the Fifth Amendment takings clause to the limitation of property rights that results from wetland regulations. Certainly, private property rights must be honored, but no one should be allowed to perform activities on their land that cause health and safety problems for others. Because the destruction of a wetland can cause serious flooding or water quality problems for other downstream private property owners, regulatory takings decisions must continue to be considered in the courts on a case-by-case basis.

I believe that we should be concentrating our efforts on encouraging landowners to protect their wetlands voluntarily. That is why I included a section of tax incentives in my bill

Congressman Don Edwards

Page 4

that will make it financially more attractive for land to be donated to qualified conservation organizations, or for activities on wetlands to be limited to compatible uses.

The U.S. Department of Agriculture has taken the lead in establishing worthwhile incentive programs. For example, the Wetlands Reserve Program, which offers direct payments and cost-sharing assistance to farmers who put their wetlands into protected easements and conduct restorations of those lands, showed much promise when it was put into effect last year. Plans to enroll some one million acres of wetlands in the program are certainly achievable, but we must provide adequate funding for it to succeed. We are missing out on a golden opportunity by not fully supporting the Wetlands Reserve Program and encouraging the creation of other similar plans.

We have reached the point where we must adopt a new attitude toward our natural resources if we are to preserve the integrity of our remaining resource base. For years we enjoyed the benefits of an abundance of land, forests, clean water and wetlands and other natural resources, which we were able to exploit with limited negative effects. This attitude of neglect is now straining our remaining resources to their limit. If we want clean and safe water supplies, healthy and diverse species populations, beautiful open spaces, and the economic benefits that are derived from them, then we must act to preserve the wetlands that remain today.

I urge the members of this committee to consider the provisions of my bill, H.R. 350, very carefully as you formulate legislation on the Clean Water Act. This bill offers a means of effectively protecting our dwindling wetlands base in a way that will allow for environmentally and economically sound development.

103D CONGRESS  
1ST SESSION

# H. R. 350

To amend the Federal Water Pollution Control Act to further the protection of wetlands, and for other purposes.

---

## IN THE HOUSE OF REPRESENTATIVES

JANUARY 5, 1993

Mr. EDWARDS of California (for himself, Mr. ABERCROMBIE, Mr. BEILENSEN, Mr. BERMAN, Mr. BLACKWELL, Mr. DELLUMS, Mr. EVANS, Mr. GILCHREST, Mr. HAMBURG, Mr. KENNEDY, Mr. LANTOS, Mr. MARKEY, Mr. MILLER of California, Mr. MINETA, Mrs. MINK, Ms. PELOSI, Mr. RAVENEL, Mr. SHAYS, Mr. STARK, Mr. STOKES, Mr. VENTO, Mr. WELDON, and Mr. YATES) introduced the following bill; which was referred jointly to the Committees on Public Works and Transportation, Merchant Marine and Fisheries, and Ways and Means

---

## A BILL

To amend the Federal Water Pollution Control Act to further the protection of wetlands, and for other purposes.

1 *Be it enacted by the Senate and House of Representa-*  
2 *tives of the United States of America in Congress assembled,*

3 **SECTION 1. SHORT TITLE.**

4 This Act may be cited as the "Wetlands Reform Act  
5 of 1993".

1 **TITLE I—AMENDMENTS TO THE**  
2 **FEDERAL WATER POLLUTION**  
3 **CONTROL ACT**

4 **SEC. 101. STATEMENT OF POLICY.**

5 Section 101(a) of the Federal Water Pollution Con-  
6 trol Act (33 U.S.C. 1251(a)) is amended—

7 (1) in paragraph (6) by striking “and” after  
8 the semicolon at the end;

9 (2) in paragraph (7) by striking the period and  
10 inserting “; and”; and

11 (3) by adding at the end the following:

12 “(8) it is the national policy to preserve the  
13 quantity and quality of the Nation’s wetlands and to  
14 restore those wetlands which have been degraded.”.

15 **SEC. 102. EXPANSION OF SCOPE OF PERMIT PROGRAM.**

16 (a) **PROHIBITION OF ACTIVITIES.**—Subsection  
17 301(a) of the Federal Water Pollution Control Act (33  
18 U.S.C. 1311(a)) is amended to read as follows:

19 “SEC. 301. (a) Except as in compliance with this sec-  
20 tion and sections 302, 306, 307, 318, 402, and 404 of  
21 this Act, the discharge of any pollutant or other alteration  
22 of navigable waters by any person shall be unlawful.”.

23 (b) **CERTIFICATION.**—The first sentence of section  
24 401(a) of the Federal Water Pollution Control Act (33  
25 U.S.C. 1341(a)) is amended to read as follows: “Any ap-

1 applicant for a Federal license or permit to conduct any ac-  
2 tivity, including the construction or operation of facilities,  
3 which may result in any discharge into or other alteration  
4 of navigable waters, shall provide the licensing or permit-  
5 ting agency a certification from the State where the activ-  
6 ity occurs or will occur, or, if appropriate, from the inter-  
7 state water pollution control agency having jurisdiction  
8 over the navigable waters where the activity occurs or will  
9 occur, that the activity will comply with the applicable pro-  
10 visions of sections 301, 302, 303, 306, and 307 and will  
11 allow for the protection, achievement, and maintenance of  
12 designated uses included in applicable water quality stand-  
13 ards.”.

14 (c) ISSUANCE OF PERMITS.—Section 404(a) of the  
15 Federal Water Pollution Control Act (33 U.S.C. 1344(a))  
16 is amended by inserting before the period at the end of  
17 the first sentence the following: “, or for other alterations  
18 of navigable waters”.

19 (d) DEFINITION.—Section 502 of the Federal Water  
20 Pollution Control Act (33 U.S.C. 1362) is amended by  
21 adding at the end the following:

22 “(21) The term ‘other alteration’ means drain-  
23 ing, dredging, excavation, channelization, flooding,  
24 clearing of vegetation, driving of pilings or place-  
25 ment of other obstructions, diversion of water, or

1 other activities in navigable waters which impair the  
2 flow, reach, or circulation of surface water, or which  
3 result in a more than minimal change in the hydro-  
4 logic regime, bottom contour, or configuration of  
5 such waters, or in the type, distribution, or diversity  
6 of vegetation, fish, and wildlife that depend on such  
7 waters.”.

8 **SEC. 103. DEFINITION OF FILL MATERIAL.**

9 Section 404(d) of the Federal Water Pollution Con-  
10 trol Act (33 U.S.C. 1344(d)) is amended—

11 (1) by inserting “(1)” after “(d)”; and

12 (2) by adding at the end the following:

13 “(2) The term ‘fill material’ as used in this section  
14 means any pollutant which has the effect of replacing por-  
15 tions of navigable waters or changing the bottom elevation  
16 or configuration of a water body.”.

17 **SEC. 104. PERMIT REVIEW BY RESOURCE AGENCIES.**

18 (a) REVIEW BY SECRETARY OF INTERIOR AND SEC-  
19 RETARY OF COMMERCE.—Section 404(m) of the Federal  
20 Water Pollution Control Act (33 U.S.C. 1344(m)) is  
21 amended by striking “Secretary of the Interior, acting  
22 through the Director of the United States Fish and Wild-  
23 life Service” each place it appears and inserting “Sec-  
24 retary of the Interior, acting through the Director of the  
25 United States Fish and Wildlife Service, and the Secretary

1 of Commerce, acting through the Assistant Administrator  
2 of the National Marine Fisheries Service”.

3 (b) RESPONSE IN WRITING.—Section 404(m) of the  
4 Federal Water Pollution Control Act (33 U.S.C. 1344(m))  
5 is amended by adding at the end the following: “The Sec-  
6 retary shall adopt the recommendations made in the com-  
7 ments or respond in writing to the Secretary of the Inte-  
8 rior or the Secretary of Commerce, as appropriate, de-  
9 scribing his or her reasons for not adopting the rec-  
10 ommendations and explaining how his or her determina-  
11 tion is consistent with the goals and purposes of this Act  
12 and the guidelines developed under section 404(b)(1).”.

13 **SEC. 105. CLARIFICATION OF GENERAL PERMIT PROGRAM.**

14 Section 404(e)(1) of the Federal Water Pollution  
15 Control Act (33 U.S.C. 1344(e)(1)) is amended to read  
16 as follows:

17 “(e)(1)(A) In carrying out the functions of the Sec-  
18 retary under this section relating to the discharge of  
19 dredged or fill material or other alteration of navigable  
20 waters, the Secretary may, after notice and opportunity  
21 for public hearing, and with the concurrence of the Admin-  
22 istrator, issue general permits on a State, multi-State, or  
23 nationwide basis for any narrowly defined category of ac-  
24 tivities involving discharges of dredged or fill material or  
25 other alterations of navigable waters if the Secretary de-

1 terminates that the activities in such category are similar  
2 in nature, will cause only minimal adverse environmental  
3 effects when performed separately, and will have only  
4 minimal cumulative adverse effect on the environment.  
5 Any general permit issued under this subsection shall be  
6 consistent with the goals and purposes of this Act, shall  
7 be based on the guidelines described in subsection (b)(1),  
8 shall set forth the requirements and standards which shall  
9 apply to any activity authorized by such general permit,  
10 and shall include adequate measures to enable the Sec-  
11 retary to be apprised of and to monitor activities con-  
12 ducted pursuant to such general permit.

13       “(B) Before any activity is authorized under a gen-  
14 eral permit for which predischARGE notification is required  
15 pursuant to regulations, notice and 30 days opportunity  
16 to comment shall be given by the Secretary to the Admin-  
17 istrator, the Secretary of the Interior, the Secretary of  
18 Commerce, State agencies responsible for water quality,  
19 fish, and wildlife resources which may be affected by such  
20 activity, and to the public.

21       “(C) No activity shall be authorized under a general  
22 permit within a State that has denied or revoked water  
23 quality certification pursuant to section 401 for such ac-  
24 tivities under that general permit.

1       “(D) Each general permit shall be reviewed by the  
2 Secretary biennially, taking into account the information  
3 contained in reports required by section 404(u), and shall,  
4 after notice and hearing, be revised or revoked as nec-  
5 essary to avoid or minimize cumulative adverse effects on  
6 navigable waters.”.

7 **SEC. 106. REPORTS ON EFFECTS OF PERMIT PROGRAM ON**  
8 **WETLANDS.**

9       Section 404 of the Federal Water Pollution Control  
10 Act (33 U.S.C. 1344) is amended by adding at the end  
11 the following:

12       “(u) REPORTS ON PERMIT PROGRAM.—

13               “(1) EFFECTS OF PERMITTED ACTIVITIES.—

14                       “(A) IN GENERAL.—The Secretary, in con-  
15 sultation with the Administrator, the Secretary  
16 of the Interior, and those States which have a  
17 permit program approved under subsection  
18 (h)(2), shall report biennially to the Congress  
19 on the effects on navigable waters of activities  
20 conducted under permits issued pursuant to  
21 this section, including general permits. Such re-  
22 ports shall contain estimates of the acreage and  
23 functions of navigable waters affected by each  
24 general permit, in order to determine whether  
25 the individual and cumulative adverse environ-

1           mental effects of activities authorized by each  
2           general permit are minimal.

3           “(B) MONITORING.—For purposes of pre-  
4           paring reports under this subsection, the Sec-  
5           retary, the Administrator, and the Secretary of  
6           the Interior shall jointly monitor the achieve-  
7           ment of the policy stated in section 101(a)(8)  
8           under permits issued under this section.

9           “(C) CONTENT OF REPORTS.—Reports  
10          under this subsection shall include consideration  
11          of relevant information contained in individual  
12          and general permit applications, compliance  
13          monitoring records and maps, and any other  
14          relevant information.

15          “(2) EFFECTS OF COMPENSATORY MITIGA-  
16          TION.—The Secretary, in consultation with the Ad-  
17          ministrator, the Secretary of the Interior, and those  
18          States which have a permit program approved under  
19          subsection (h)(2), shall report biennially to the Con-  
20          gress on the effects on navigable waters of compen-  
21          satory mitigation required under permits issued  
22          under this section, including general permits. Such  
23          reports shall contain—

1                   “(A) estimates of the number of permits  
2                   for which compensatory mitigation is required;  
3                   and

4                   “(B) a description of—

5                   “(i) the type and extent of compen-  
6                   satory mitigation projects required,

7                   “(ii) the degree of compliance with  
8                   those compensatory mitigation require-  
9                   ments,

10                   “(iii) the extent to which such com-  
11                   pensatory mitigation requirements have  
12                   been successful in restoring the intended  
13                   range of functions and values, and

14                   “(iv) the extent to which monitoring  
15                   and enforcement of compensatory mitiga-  
16                   tion requirements have been conducted by  
17                   the agencies.”.

18 **SEC. 107. EXPEDITED PERMIT REVIEW.**

19                   Section 404(q) of the Federal Water Pollution Con-  
20                   trol Act (33 U.S.C. 1344(q)) is amended to read as fol-  
21                   lows:

22                   “(q)(1) **REDUCTION IN PAPERWORK AND DELAYS.**—

23                   Not later than the 180th day after the date of the enact-  
24                   ment of this subsection, the Secretary shall enter into  
25                   agreements with the Administrator, the Secretaries of the

1 Departments of Agriculture, Commerce, and Interior, and  
2 the heads of other appropriate Federal agencies to mini-  
3 mize, to the maximum extent practicable, duplication,  
4 needless paperwork, and delays in the issuance of permits  
5 under this section.

6 “(2) FAST TRACK FOR MINOR PERMITS.—

7 “(A) Not later than 6 months after the date of  
8 enactment of this subsection, the Secretary shall es-  
9 tablish in each district office a special Fast Track  
10 team to expedite the review and processing of minor  
11 permits. Each team shall consist of not more than  
12 25 percent of all personnel assigned to review permit  
13 applications under this section, and shall not be as-  
14 signed to review or process any permits other than  
15 minor permits, unless final decisions have been  
16 reached with respect to all such minor permits with-  
17 in 60 days after the notice of application for such  
18 permits is published pursuant to subsection (a).

19 “(B) The District Engineer in each district of-  
20 fice shall review the operations of the Fast Track  
21 team in that office every 6 months. If final decisions  
22 on a significant percentage of minor permits have  
23 not been reached within 60 days after the notice of  
24 application for such permits is published pursuant to

1 subsection (a), additional personnel shall be assigned  
2 to the Fast Track team.

3 “(C) For purposes of this subsection, a minor  
4 permit is a permit for an activity that would disturb  
5 no more than 1 acre of wetlands, is being performed  
6 by a private individual or a business that employs no  
7 more than 10 people, and is not part of a larger  
8 common plan or proposal that would disturb addi-  
9 tional acreage, except that a permit shall not be a  
10 minor permit if—

11 “(i) the Secretary is required under the  
12 National Environmental Policy Act of 1969 to  
13 issue an environmental impact statement;

14 “(ii) the permit involves an activity that  
15 may affect any species that is listed as an en-  
16 dangered species or threatened species under  
17 the Endangered Species Act of 1973, or the  
18 habitat of such a species; or

19 “(iii) the Secretary, the Administrator, or  
20 a Federal department or agency referred to in  
21 paragraph (1) requests that the permit applica-  
22 tion receive additional review.”.

1 **SEC. 108. AVOIDANCE AND MINIMIZATION OF ADVERSE EF-**  
2 **FECTS.**

3 Section 404 of the Federal Water Pollution Control  
4 Act (33 U.S.C. 1344), as amended by this Act, is further  
5 amended by adding at the end the following:

6 “(v) No individual or general permit shall be issued  
7 for an activity pursuant to this section if there is a prac-  
8 ticable alternative to the proposed activity which would  
9 have less adverse environmental impact on navigable  
10 waters.”.

11 **SEC. 109. EXEMPTIONS FOR AGRICULTURE AND OTHER AC-**  
12 **TIVITIES.**

13 (a) IN GENERAL.—Section 404(f) of the Federal  
14 Water Pollution Control Act (33 U.S.C. 1344) is amended  
15 to read as follows:

16 “(f)(1) Except as provided in paragraph (2), the dis-  
17 charge of dredge or fill material in or other alterations  
18 of navigable waters—

19 “(A) from normal farming, silviculture, and  
20 ranching activities, such as plowing, seeding, cul-  
21 tivating, minor drainage, harvesting for the produc-  
22 tion of food, fiber, and forest products, and upland  
23 soil and water conservation practices;

24 “(B) for the purpose of maintenance, including  
25 emergency reconstruction of recently damaged parts,  
26 of currently serviceable structures such as dikes,

1 dams, levees, groins, riprap, breakwaters, causeways,  
2 bridge abutments or approaches, and transportation  
3 structures, to their current or most recent configura-  
4 tion;

5 “(C) for the purpose of construction or mainte-  
6 nance of farm or stock ponds or irrigation ditches,  
7 or the maintenance of drainage ditches;

8 “(D) for the purpose of construction of tem-  
9 porary sedimentation basins on a construction site  
10 which does not involve placement of fill material into  
11 navigable waters;

12 “(E) for the purpose of construction or mainte-  
13 nance of farm roads or forest roads, or temporary  
14 roads for moving mining equipment, where such  
15 roads are constructed and maintained, in accordance  
16 with best management practices, to assure that flow  
17 and circulation patterns and chemical and biological  
18 characteristics of the navigable waters are not im-  
19 paired, that the reach of the navigable waters is not  
20 reduced, and that any adverse effect on the aquatic  
21 environment will otherwise be minimized; or

22 “(F) resulting from any activity with respect to  
23 which a State has an approved program under sec-  
24 tion 208(b)(4) which meets the requirements of sub-  
25 paragraphs (B) and (C) of that section;

1 is not prohibited by or otherwise subject to regulation  
2 under this section or section 301(a) or 402 (except for  
3 effluent standards or prohibitions under section 307).

4       “(2) Any discharge of dredged or fill material into,  
5 or other alteration of, the navigable waters incidental to  
6 any activity having as its purpose bringing an area of the  
7 navigable waters into a use to which it was not previously  
8 subject, where the flow or circulation of navigable waters  
9 may be impaired or the reach of such waters be reduced,  
10 shall be required to have a permit under this section.

11       “(3) An activity which does not result in the dis-  
12 charge of dredge or fill material into, or other alterations  
13 of, the navigable waters shall not be prohibited or other-  
14 wise subject to regulation under this section.

15       “(4)(A) For purposes of this section, the following  
16 shall not be considered to be navigable waters:

17               “(i) Nontidal drainage and irrigation ditches  
18 excavated in uplands.

19               “(ii) Artificially irrigated areas which would re-  
20 vert to uplands if the irrigation ceased.

21               “(iii) Artificial lakes or ponds created by exca-  
22 vating or diking uplands to collect and retain water,  
23 and which are used exclusively for stock watering, ir-  
24 rigation, or rice growing.

1           “(iv) Artificial reflecting or swimming pools or  
2 other small ornamental bodies of water created by  
3 excavating or diking uplands to retain water for pri-  
4 marily aesthetic reasons.

5           “(v) Waterfilled depressions created in uplands  
6 incidental to construction activity and pits excavated  
7 in uplands for the purpose of obtaining fill, sand, or  
8 grave<sup>1</sup>, unless and until the construction or exca-  
9 vation operation is abandoned and the resulting  
10 body of water meets the definition of waters of the  
11 United States.

12          “(B) Subparagraph (A) shall not apply to a particu-  
13 lar water body unless the person desiring to conduct an  
14 activity in that water body is able to demonstrate that the  
15 water body qualifies under subparagraph (A) for exemp-  
16 tion from regulation under this section.

17          “(5) Except as provided in paragraph (2), normal  
18 plowing, seeding, cultivating, minor drainage for crop pro-  
19 duction, or harvesting shall not be prohibited or otherwise  
20 subject to regulation under this section in waters of the  
21 United States which have been maintained as cropland at  
22 least one growing season in the 5-years prior to such plow-  
23 ing, seeding, cultivating, minor drainage, or harvesting.”.

1 **SEC. 110. CITIZEN SUITS AMENDMENTS.**

2 Section 505 of the Federal Water Pollution Control  
3 Act (33 U.S.C. 1365) is amended—

4 (1) in subsection (f) by striking “or (7)” and  
5 inserting the following: “(7) a permit or condition  
6 thereof issued under section 404, which has been, or  
7 is, in effect under this Act (including a requirement  
8 applicable by reason of section 313); or (8)”;

9 (2) in subsection (a)(1)(B) by inserting after
